TO THE RIGHT HONOURABLE

THOMAS,

EARL OF PEMBROKE AND MONTGOMERY,

Baron Herbert of Cardiff, Lord Ross of Kendal, Par, Fitzhugh, Marmion, St. Quintin,
and Shurland; Lord President of his Majesty's Most Honourable Privy-Council,
and Lord Lieutenant of the County of Wilts, and of South Wales.

MY LORD,

THIS treatise, which is grown up under your lordship's eye, and has ventured into the world by your order, does now, by a natural kind of right, come to your lordship for that protection which you several years since promised it. It is not that I think any name, how great soever, set at the beginning of a book, will be able to cover the faults that are to be found in it. Things in print must stand and fall by their own worth, or the reader's fancy. But there being nothing more to be desired for Truth than a fair unprejudiced hearing, nobody is more likely to procure me that than your lordship, who is allowed to have got so intimate an acquaintance with her, in her more retired recesses. Your lordship is known to have so far advanced your speculations in the most abstract and general knowledge of things, beyond the ordinary reach, or common methods, that your allowance and approbation of the design of this treatise, will at least preserve it from being condemned without reading; and will prevail to have those parts a little weighed, which might otherwise, perhaps, be thought to deserve no consideration, for being somewhat out of the common road. The imputation of novelty is a terrible charge amongst those who judge of men's heads, as they do of their perukes, by the fashion; and can allow none to be right, but the received doctrines. Truth scarce ever yet carried it by vote any where at its first appearance: new opinions are always suspected, and usually opposed, without any other reason, but because they are not already common. But truth, like gold, is not the less so for being newly brought out of the mine. It is trial and examination must give it price, and not any antique fashion: and though it be not yet current by the public stamp, yet it may, for all that, be as old as nature, and is certainly not the less genuine. Your lordship can give great and convincing instances of this, whenever you please to oblige the public with some of those large and comprehensive discoveries you have made of truths hitherto unknown, unless to some few, from whom your lordship has been pleased not wholly to conceal them. This alone were a sufficient reason, were there no other, why I should dedicate this Essay to your lordship; and its having some little correspondence with some parts of that nobler and vast system of the sciences your lordship has made so new, exact, and instructive a draught of, I think it glory enough, if your lordship permit me to boast, that here and there I have fallen

into some thoughts not wholly different from yours. If your lordship think fit, that, by your encouragement, this should appear in the world, I hope it may be a reason, some time or other, to lead your lordship farther; and you will allow me to say, that you here give the world an earnest of something, that, if they can bear with this, will be truly worth their expectation. This, my lord, shews what a present I here make to your lordship: just such as the poor man does to his rich and great neighbour, by whom the basket of flowers, or fruit, is not ill taken, though he has more plenty of his own growth, and in much greater perfection. Worthless things receive a value, when they are made the offerings of respect, esteem, and gratitude: these you have given me so mighty and peculiar reasons to have, in the highest degree, for your lordship, that if they can add a price to what they go along with, proportionable to their own greatness, I can with confidence brag, I here make your lordship the richest present you ever received. This I am sure, I am under the greatest obligation to seek all occasions to acknowledge a long train of favours I have received from your lordship; favours, though great and important in themselves, yet made much more so by the forwardness, concern, and kindness, and other obliging circumstances, that never failed to accompany them. To all this you are pleased to add that which gives yet more weight and relish to all the rest: you vouchsafe to continue me in some degrees of your esteem, and allow me a place in your good thoughts—I had almost said friendship. This, my lord, your words and actions so constantly shew on all occasions, even to others when I am absent, that it is not vanity in me to mention what every body knows: but it would be want of good manners, not to acknowledge what so many are witnesses of, and every day tell me I am indebted to your lordship for. I wish they could as easily assist my gratitude, as they convince me of the great and growing engagements it has to your lordship. This I am sure, I should write of the understanding without having any, if I were not extremely sensible of them, and did not lay hold on this opportunity to testify to the world, how much I am obliged to be, and how much I am,

My Lord,

Your Lordship's most humble, and most obedient servant,

JOHN LOCKE.

*Dorset Court,
24th of May, 1689.*

THE
EPISTLE TO THE READER.

READER,

I HERE put into thy hands, what has been the diversion of some of my idle and heavy hours : if it has the good luck to prove so of any of thine, and thou hast but half so much pleasure in reading, as I had in writing it, thou wilt as little think thy money, as I do my pains, ill bestowed. Mistake not this for a commendation of my work ; nor conclude, because I was pleased with the doing of it, that therefore I am fondly taken with it now it is done. He that hawks at larks and sparrows, has no less sport, though a much less considerable quarry, than he that flies at nobler game : and he is little acquainted with the subject of his treatise, the UNDERSTANDING, who does not know, that as it is the most elevated faculty of the soul, so it is employed with a greater, and more constant, delight, than any of the other. Its searches after truth are a sort of hawking and hunting, wherein the very pursuit makes a great part of the pleasure. Every step the mind takes in its progress towards knowledge, makes some discovery, which is not only new, but the best too, for the time at least.

For the understanding, like the eye, judging of objects only by its own sight, cannot but be pleased with what it discovers, having less regret for what has escaped it, because it is unknown. Thus he who has raised himself above the alms-basket, and, not content to live lazily on scraps of begged opinions, sets his own thoughts on work, to find and follow truth, will (whatever he lights on) not miss the hunter's satisfaction ; every moment of his pursuit, will reward his pains with some delight, and he will have reason to think his time not ill spent, even when he cannot much boast of any great acquisition.

This, reader, is the entertainment of those who let loose their own thoughts, and follow them in writing ; which thou ought not to envy them, since they afford thee an opportunity of the like diversion, if thou wilt make use of thy own thoughts in reading. It is to them, if they are thy own, that I refer myself : but if they are taken upon trust from others, it is no great matter what they are, they not following truth, but some meaner consideration : and it is not worth while to be concerned, what he says or thinks, who says or thinks only as he is directed by another. If thou judgest for thyself, I know thou wilt judge candidly ; and then I shall not be harmed or offended, whatever be thy censure. For though it be certain, that there is nothing in this treatise, of the truth whereof I am not fully persuaded ; yet I consider myself as liable to mistakes as I can think thee ; and know, that this book must stand or fall with thee, not by any opinion I have of it, but by thy own. If thou findest little in it new or instructive to thee, thou art not to blame me for it. It was not meant for those that had already mastered this subject, and made a thorough acquaintance with their own understandings ; but for my own information, and the satisfaction of a few friends, who acknowledged themselves not to have sufficiently considered it. Were it fit to trouble thee with the history of this Essay,

I should tell thee, that five or six friends meeting at my chamber, and discoursing on a subject very remote from this, found themselves quickly at a stand, by the difficulties that rose on every side. After we had a while puzzled ourselves, without coming any nearer a resolution of those doubts which perplexed us, it came into my thoughts, that we took a wrong course; and that, before we set ourselves upon inquiries of that nature, it was necessary to examine our own abilities, and see what objects our understandings were, or were not, fitted to deal with. This I proposed to the company, who all readily assented; and thereupon it was agreed, that this should be our first inquiry. Some hasty and undigested thoughts, on a subject I had never before considered, which I set down against our next meeting, gave the first entrance into this discourse; which having been thus begun by chance, was continued by entreaty, written by incoherent parcels; and after long intervals of neglect, resumed again, as my humour or occasions permitted; and at last, in a retirement, where an attendance on my health gave me leisure, it was brought into that order thou seest it.

This discontinued way of writing may have occasioned, besides others, two contrary faults, viz. that too little and too much may be said in it. If thou findest any thing wanting, I shall be glad, that what I have writ, gives thee any desire that I should have gone farther: if it seems too much to thee, thou must blame the subject; for when I first put pen to paper, I thought all I should have to say on this matter, would have been contained in one sheet of paper; but the farther I went, the larger prospect I had; new discoveries led me still on, and so it grew insensibly to the bulk it now appears in. I will not deny, but possibly it might be reduced to a narrower compass than it is; and that some parts of it might be contracted; the way it has been writ in, by catches, and many long intervals of interruption, being apt to cause some repetitions. But to confess the truth, I am now too lazy, or too busy, to make it shorter.

I am not ignorant how little I herein consult my own reputation, when I knowingly let it go with a fault, so apt to disgust the most judicious, who are always the nicest readers. But they who know sloth is apt to content itself with any excuse, will pardon me, if mine has prevailed on me, where, I think, I have a very good one. I will not, therefore, allege in my defence, that the same notion, having different respects, may be convenient or necessary to prove or illustrate several parts of the same discourse; and that so it has happened in many parts of this; but waving that, I shall frankly avow, that I have sometimes dwelt long upon the same argument, and expressed it different ways, with a quite different design. I pretend not to publish this Essay for the information of men of large thoughts and quick apprehensions; to such masters of knowledge I profess myself a scholar, and therefore warn them beforehand not to expect any thing here but what, being spun out of my own coarse thoughts, is fitted to men of my own size; to whom, perhaps, it will not be acceptable, that I have taken some pains to make plain and familiar to their thoughts some truths, which established prejudice, or the abstractness of the ideas themselves, might render difficult. Some objects had need be turned on every side; and when the notion is new, as I confess some of them are to me, or out of the ordinary road, as I suspect they will appear to others, it is not one simple view of it that will gain it admittance into every understanding, or fix it there with a clear and lasting impression. There are few, I believe, who have not observed in themselves or others, that what in one way of proposing was very obscure, another way of ex-

pressing it has made very clear and intelligible; though afterward the mind found little difference in the phrases, and wondered why one failed to be understood more than the other. But every thing does not hit alike upon every man's imagination. We have our understandings no less different than our palates; and he that thinks the same truth shall be equally relished by every one in the same dress, may as well hope to feast every one with the same sort of cookery: the meat may be the same, and the nourishment good, yet every one not be able to receive it with that seasoning; and it must be dressed another way, if you will have it go down with some, even of strong constitutions. The truth is, those who advised me to publish it, advised me, for this reason, to publish it as it is: and since I have been brought to let it go abroad, I desire it should be understood by whoever gives himself the pains to read it. I have so little affectation to be in print, that if I were not flattered this Essay might be of some use to others, as I think it has been to me, I should have confined it to the view of some friends, who gave the first occasion to it. My appearing therefore in print, being on purpose to be as useful as I may, I think it necessary to make what I have to say as easy and intelligible to all sorts of readers as I can. And I had much rather the speculative and quick-sighted should complain of my being in some parts tedious, than that any one, not accustomed to abstract speculations, or prepossessed with different notions, should mistake, or not comprehend my meaning.

It will possibly be censured as a great piece of vanity or insolence in me, to pretend to instruct this our knowing age, it amounting to little less, when I own, that I publish this Essay with hopes it may be useful to others. But if it may be permitted to speak freely of those, who with a feigned modesty condemn as useless what they themselves write, methinks it savours much more of vanity or insolence to publish a book for any other end; and he fails very much of that respect he owes the public, who prints, and consequently expects men should read, that wherein he intends not they should meet with any thing of use to themselves or others: and should nothing else be found allowable in this treatise, yet my design will not cease to be so; and the goodness of my intention ought to be some excuse for the worthlessness of my present. It is that chiefly which secures me from the fear of censure, which I expect not to escape more than better writers. Men's principles, notions, and relishes, are so different, that it is hard to find a book which pleases or displeases all men. I acknowledge the age we live in is not the least knowing, and therefore not the most easy to be satisfied. If I have not the good luck to please, yet nobody ought to be offended with me. I plainly tell all my readers, except half-a-dozen, this treatise was not at first intended for them; and therefore they need not be at the trouble to be of that number. But yet if any one thinks fit to be angry, and rail at it, he may do it securely: for I shall find some better way of spending my time, than in such kind of conversation. I shall always have the satisfaction to have aimed sincerely at truth and usefulness, though in one of the meanest ways. The commonwealth of learning, is not at this time without master-builders, whose mighty designs, in advancing the sciences, will leave lasting monuments to the admiration of posterity; but every one must not hope to be a Boyle, or a Sydenham; and in an age that produces such masters, as the great Huygenius, and the incomparable Mr. Newton, with some other of that strain, it is ambition enough to be employed as an under-labourer in clearing the ground a little, and removing some of the rubbish that lies in the way to knowledge; which certainly had

been very much more advanced in the world, if the endeavours of ingenious and industrious men had not been much cumbered with the learned, but frivolous, use of uncouth, affected, or unintelligible terms, introduced into the sciences and there made an art of to that degree; that philosophy, which is nothing but the true knowledge of things, was thought unfit, or incapable, to be brought into well-bred company, and polite conversation. Vague and insignificant forms of speech, and abuse of language, have so long passed for mysteries of science; and hard or misapplied words, with little or no meaning, have, by prescription, such a right to be mistaken for deep learning, and height of speculation, that it will not be easy to persuade, either those who speak, or those who hear them, that they are but the covers of ignorance, and hinderance of true knowledge. To break in upon the sanctuary of vanity and ignorance, will be, I suppose, some service to human understanding: though so few are apt to think they deceive, or are deceived, in the use of words; or that the language of the sect they are of has any faults in it, which ought to be examined or corrected; that I hope I shall be pardoned, if I have in the third book dwelt long on this subject, and endeavoured to make it so plain, that neither the inveterateness of the mischief, nor the prevalency of the fashion, shall be any excuse for those, who will not take care about the meaning of their own words, and will not suffer the significancy of their expressions to be inquired into.

I have been told that a short epitome of this treatise, which was printed in 1688, was by some condemned without reading, because innate ideas were denied in it; they too hastily concluding, that if innate ideas were not supposed, there would be little left, either of the notion or proof of spirits. If any one take the like offence at the entrance of this treatise, I shall desire him to read it through; and then I hope he will be convinced, that the taking away false foundations is not to the prejudice, but advantage, of truth; which is never injured or endangered so much, as when mixed with, or built on, falsehood. In the second edition, I added as followeth:

The bookseller will not forgive me, if I say nothing of this second edition, which he has promised, by the correctness of it, shall make amends for the many faults committed in the former. He desires, too, that it should be known that it has one whole new chapter concerning identity, and many additions and amendments in other places. These I must inform my reader are not all new matter, but most of them either farther confirmation of what I had said, or explication to prevent others being mistaken in the sense of what was formerly printed, and not any variation in me from it; I must only except the alterations I have made in book ii. chap. 21.

What I had there writ concerning liberty and the will, I thought deserved as accurate a review as I was capable of: those subjects having in all ages exercised the learned part of the world, with questions and difficulties that have not a little perplexed morality and divinity; those parts of knowledge that men are most concerned to be clear in. Upon a closer inspection into the working of men's minds, and a stricter examination of those motives and views they are turned by, I have found reason somewhat to alter the thoughts I formerly had concerning that which gives the last determination to the will in all voluntary actions. This I cannot forbear to acknowledge to the world, with as much freedom and readiness as I at first published what then seemed to me to be right, thinking myself more concerned to quit and renounce any opinion of my own, than

oppose that of another, when truth appears against it. For it is truth alone I seek, and that will always be welcome to me, when or from whence soever it comes.

But what forwardness soever I have to resign any opinion I have, or to recede from any thing I have writ, upon the first evidence of any error in it; yet this I must own, that I have not had the good luck to receive any light from those exceptions I have met with in print against any part of my book; nor have, from any thing that has been urged against it, found reason to alter my sense, in any of the points that have been questioned. Whether the subject I have in hand requires often more thought and attention than cursory readers, at least such as are prepossessed, are willing to allow; or whether any obscurity in my expressions casts a cloud over it, and these notions are made difficult to others' apprehensions in my way of treating them; so it is, that my meaning, I find, is often mistaken, and I have not the good luck to be every where rightly understood. There are so many instances of this, that I think it justice to my reader and myself to conclude, that either my book is plainly enough written to be rightly understood by those who peruse it with that attention and indifferency, which every one who will give himself the pains to read ought to employ in reading; or else, that I have writ mine so obscurely, that it is in vain to go about to mend it. Whichever of these be the truth, it is myself only am affected thereby; and therefore I shall be far from troubling my reader with what I think might be said in answer to those several objections I have met with to passages here and there of my book; since I persuade myself that he who thinks them of moment enough to be concerned, whether they are true or false, will be able to see, that what is said, is either not well founded, or else not contrary to my doctrine, when I and my opposer come both to be well understood.

If any, careful that none of their good thoughts should be lost, have published their censures of my Essay, with this honour done to it, that they will not suffer it to be an Essay, I leave it to the public to value the obligation they have to their critical pens, and shall not waste my reader's time in so idle or ill-natured an employment of mine, as to lessen the satisfaction any one has in himself, or gives to others, in so hasty a confutation of what I have written.

The bookseller preparing for the fourth edition of my Essay, gave me notice of it, that I might, if I had leisure, make any additions or alterations I should think fit. Whereupon I thought it convenient to advertise the reader, that besides several corrections I had made here and there, there was one alteration which it was necessary to mention, because it ran through the whole book, and is of consequence to be rightly understood. What I thereupon said, was this:

Clear and distinct ideas are terms which, though familiar and frequent in men's mouths, I have reason to think every one who uses does not perfectly understand. And possibly it is but here and there one who gives himself the trouble to consider them so far as to know what he himself or others precisely mean by them: I have therefore in most places chosen to put determinate or determined, instead of clear and distinct, as more likely to direct men's thoughts to my meaning in this matter. By those denominations, I mean some object in the mind, and consequently determined, i. e. such as it is there seen and perceived to be. This, I think, may fitly be called a determinate or determined idea, when such as it is at any time objectively in the mind, and so determined there, it is annexed, and without variation determined to a name or articulate sound, which is to

be steadily the sign of that very same object of the mind, or determinate idea.

To explain this a little more particularly. By determinate, when applied to a simple idea, I mean that simple appearance which the mind has in its view, or perceives in itself, when that idea is said to be in it: by determinate, when applied to a complex idea, I mean such a one as consists of a determinate number of certain simple or less complex ideas, joined in such a proportion and situation, as the mind has before its view, and sees in itself, when that idea is present in it, or should be present in it, when a man gives a name to it: I say should be; because it is not every one, nor perhaps any one, who is so careful of his language, as to use no word, till he views in his mind the precise determined idea which he resolves to make it the sign of. The want of this, is the cause of no small obscurity and confusion in men's thoughts and discourses.

I know there are not words enough in any language, to answer all the variety of ideas that enter into men's discourses and reasonings. But this hinders not, but that when any one uses any term, he may have in his mind a determined idea, which he makes it the sign of, and to which he should keep it steadily annexed, during that present discourse. Where he does not, or cannot, do this, he in vain pretends to clear or distinct ideas; it is plain his are not so: and therefore there can be expected nothing but obscurity and confusion, where such terms are made use of, which have not such a precise determination.

Upon this ground, I have thought determined ideas a way of speaking less liable to mistake than clear and distinct: and where men have got such determined ideas of all that they reason, inquire, or argue about, they will find a great part of their doubts and disputes at an end. The greatest part of the questions and controversies that perplex mankind, depending on the doubtful and uncertain use of words, or (which is the same) indetermined ideas which they are made to stand for, I have made choice of these terms to signify, 1. Some immediate object of the mind, which it perceives and has before it, distinct from the sound it uses as a sign of it. 2. That this idea, thus determined, i. e. which the mind has in itself, and knows and sees there, be determined without any change to that name, and that name determined to that precise idea. If men had such determined ideas in their inquiries and discourses, they would both discern how far their own inquiries and discourses went, and avoid the greatest part of the disputes and wranglings they have with others.

Besides this, the bookseller will think it necessary I should advertise the reader, that there is an addition of two chapters wholly new; the one of the association of ideas, the other of enthusiasm. These with some other larger additions never before printed, he has engaged to print by themselves after the same manner, and for the same purpose, as was done when this Essay had the second impression.

In this sixth edition, there is very little added or altered; the greatest part of what is new, is contained in the 21st chapter of the second book; which any one, if he thinks it worth while, may, with a very little labour, transcribe into the margin of the former edition.

CONTENTS.

BOOK I.

Chap.	Page
1. An inquiry into the understanding	13
2. No innate speculative principles	20
3. No innate practical principles	32
4. Other considerations concerning innate principles, both speculative and practical.....	46

BOOK II.

1. Of ideas in general.....	60
2. Of simple ideas.....	70
3. Of ideas of one sense	73
4. Of solidity	74
5. Of simple ideas of divers senses	77
6. Of simple ideas of reflection	78
7. Of simple ideas of both sensation and reflection	78
8. Some farther considerations concerning our simple ideas.....	80
9. Of perception	88
10. Of retention.....	92
11. Of discerning, and other operations of the mind.....	96
12. Of complex ideas	102
13. Of simple modes, and, first, of the simple modes of space	104
14. Of duration and its simple modes	114
15. Of duration and expansion, considered together.....	124
16. Of number.....	130
17. Of infinity	133
18. Of other simple modes	143
19. Of the modes of thinking	145
20. Of modes of pleasure and pain	147
21. Of power.....	150
22. Of mixed modes	184
23. Of our complex ideas of substances	189
24. Of collective ideas of substances	208
25. Of relation	209
26. Of cause and effect, and other relations	213
27. Of identity and diversity	215
28. Of other relations	242
29. Of clear and obscure, distinct and confused, ideas.....	251
30. Of real and fantastical ideas	258
31. Of adequate and inadequate ideas.....	260
32. Of true and false ideas	266
33. Of the association of ideas	274

BOOK III.

Chap.	Page
1. Of words and language in general	279
2. Of the signification of words	281
3. Of general terms	284
4. Of the names of simple ideas	295
5. Of the names of mixed modes and relations	301
6. Of the names of substances	308
7. Of particles	330
8. Of abstract and concrete terms	332
9. Of the imperfection of words	333
10. Of the abuse of words	344
11. Of the remedies of the foregoing imperfections and abuses	357

BOOK IV.

1. Of knowledge in general	367
2. Of the degrees of our knowledge	374
3. Of the extent of human knowledge	379
4. Of the reality of knowledge	410
5. Of truth in general	418
6. Of universal propositions, their truth and certainty	422
7. Of maxims	430
8. Of trifling propositions	443
9. Of our knowledge of existence	449
10. Of the knowledge of the existence of a God	450
11. Of the knowledge of the existence of other things	457
12. Of the improvement of our knowledge	464
13. Some other considerations concerning our knowledge	471
14. Of judgment	472
15. Of probability	474
16. Of the degrees of assent	476
17. Of reason	484
18. Of faith and reason, and their distinct provinces	498
19. Of enthusiasm	504
20. Of wrong assent or error	510
21. The division of the sciences	519

THOUGHTS CONCERNING READING AND STUDY FOR A GENTLEMAN	521
OF THE CONDUCT OF THE UNDERSTANDING	529

HUMAN UNDERSTANDING.

BOOK I.—CHAPTER I.

INTRODUCTION.

§ 1. *AN inquiry into the understanding, pleasant and useful.*—SINCE it is the understanding that sets man above the rest of sensible beings, and gives him all the advantage and dominion which he has over them; it is certainly a subject, even from its nobleness, worth our labour to inquire into. The understanding, like the eye, whilst it makes us see, and perceive all other things, takes no notice of itself: and it requires art and pains to set it at a distance, and make it its own object. But whatever be the difficulties that lie in the way of this inquiry, whatever it be that keeps us so much in the dark to ourselves, sure I am, that all the light we can let in upon our own minds, all the acquaintance we can make with our own understandings, will not only be very pleasant, but bring us great advantage, in directing our thoughts in the search of other things.

§ 2. *Design.*—This, therefore, being my purpose, to inquire into the original, certainty, and extent of human knowledge; together with the grounds and degrees of belief, opinion, and assent; I shall not at present meddle with the physical consideration of the mind; or trouble myself to examine wherein its essence consists, or by what motions of our spirits, or alterations of our bodies, we come to have any sensation by our organs, or any ideas in our understandings; and whether those ideas do, in their formation, any, or all of them, depend on matter or no: these are speculations, which, however curious and entertaining, I shall decline, as lying out of my way, in the design I am now upon. It shall suffice to my present purpose, to consider the discerning faculties of a man, as they are employed about the objects which they have to do with: and I shall imagine I have not wholly misemployed myself in the thoughts I shall have on this occasion, if, in this historical plain method, I can give any account of the ways whereby our understandings come to attain those notions of things we have, and can set down any measures of the certainty of our knowledge, or the grounds of those persuasions, which are to be found amongst men, so various, different, and wholly contradictory; and yet asserted somewhere or other with such assurance and confidence, that he that shall take a view of the opinions of mankind, observe their opposition, and at the same time consider the fondness and devotion wherewith they are embraced, the resolution and eagerness wherewith they are maintained, may perhaps have reason to suspect, that either there is no such thing as truth at all; or that mankind hath no sufficient means to attain a certain knowledge of it.

§ 3. *Method.*—It is, therefore, worth while to search out the bounds between opinion and knowledge; and examine by what measures, in things, whereof we have no certain knowledge, we ought to regulate our assent, and moderate our persuasions. In order whereunto, I shall pursue this following method.

First. I shall inquire into the original of those ideas, notions, or whatever else you please to call them, which a man observes, and is conscious to himself he has in his mind; and the ways whereby the understanding comes to be furnished with them.

Secondly. I shall endeavour to shew what knowledge the understanding hath by those ideas; and the certainty, evidence, and extent of it.

Thirdly. I shall make some inquiry into the nature and grounds of faith or opinion; whereby I mean that assent which we give to any proposition as true, of whose truth yet we have no certain knowledge: and here we shall have occasion to examine the reasons and degrees of assent.

§ 4. *Useful to know the extent of our comprehension.*—If by this inquiry into the nature of the understanding, I can discover the powers thereof; how far they reach, to what things they are in any degree proportionate, and where they fail us; I suppose it may be of use to prevail with the busy mind of man to be more cautious in meddling with things exceeding its comprehension; to stop when it is at the utmost extent of its tether; and to sit down in a quiet ignorance of those things, which upon examination, are found to be beyond the reach of our capacities. We should not then, perhaps, be so forward, out of an affectation of a universal knowledge, to raise questions, and perplex ourselves and others with disputes about things to which our understandings are not suited; and of which we cannot frame in our minds any clear or distinct perceptions, or whereof (as it has, perhaps, too often happened) we have not any notions at all. If we can find out how far the understanding can extend its views, how far it has faculties to attain certainty, and in what cases it can only judge and guess; we may learn to content ourselves with what is attainable by us in this state.

§ 5. *Our capacity suited to our state and concerns.*—For though the comprehension of our understandings comes exceeding short of the vast extent of things, yet we shall have cause enough to magnify the bountiful Author of our being, for that proportion and degree of knowledge he has bestowed on us, so far above all the rest of the inhabitants of this our mansion. Men have reason to be well satisfied with what God hath thought fit for them, since he has given them (as St. Peter says) πάντα πρὸς ζωὴν καὶ εὐσέβειαν, whatsoever is necessary for the conveniences of life, and information of virtue; and has put within the reach of their discovery the comfortable provision for this life, and the way that leads to a better. How short soever their knowledge may come of a universal or perfect comprehension of whatsoever is, it yet secures their great concerns, that they have light enough to lead them to the knowledge of their Maker, and the sight of their own duties. Men may find matter sufficient to busy their heads, and employ their hands with variety, delight, and satisfaction; if they will not boldly quarrel with their own constitution, and throw away the blessings their

hands are filled with, because they are not big enough to grasp every thing. We shall not have much reason to complain of the narrowness of our minds, if we will but employ them about what may be of use to us; for of that they are very capable; and it will be an unpardonable, as well as childish peevishness, if we undervalue the advantages of our knowledge, and neglect to improve it to the ends for which it was given us, because there are some things that are set out of the reach of it. It will be no excuse to an idle and untoward servant, who would not attend his business by candle-light, to plead that he had not broad sunshine. The candle that is set up in us, shines bright enough for all our purposes. The discoveries we can make with this, ought to satisfy us; and we shall then use our understanding right, when we entertain all objects in that way and proportion, that they are suited to our faculties; and upon those grounds, they are capable of being proposed to us; and not peremptorily, or intemperately, require demonstration, and demand certainty, where probability only is to be had, and which is sufficient to govern all our concerns. If we will disbelieve every thing, because we cannot certainly know all things, we shall do much-wisely as he who would not use his legs, but sit still and perish, because he had no wings to fly.

§ 6. *Knowledge of our capacity a cure of scepticism and idleness.*—When we know our own strength, we shall the better know what to undertake with hopes of success; and when we have well surveyed the powers of our own minds, and made some estimate what we may expect from them, we shall not be inclined either to sit still, and not set our thoughts on work at all, in despair of knowing any thing; nor, on the other side, question every thing, and disclaim all knowledge, because some things are not to be understood. It is of great use to the sailor to know the length of his line, though he cannot with it fathom all the depths of the ocean. It is well he knows that it is long enough to reach the bottom, at such places as are necessary to direct his voyage, and caution him against running upon shoals that may ruin him. Our business here is not to know all things, but those which concern our conduct. If we can find out those measures whereby a rational creature, put in that state which man is in, in this world, may and ought to govern his opinions and actions depending thereon, we need not be troubled that some other things escape our knowledge.

§ 7. *Occasion of this essay.*—This was that which gave the first rise to this essay concerning the understanding. For I thought that the first step towards satisfying several inquiries, the mind of man was very apt to run into, was to take a survey of our own understanding, examine our own powers, and see to what things they were adapted. Till that was done, I suspected we began at the wrong end, and in vain sought for satisfaction in a quiet and sure possession of truths that most concerned us, whilst we let loose our thoughts into the vast ocean of being; as if all that boundless extent were the natural and unbounded possession of our understandings, wherein there was nothing exempt from its decisions, or that escaped its comprehension. Thus men, extending their inquiries beyond their capacities, and letting their thoughts wander into those depths where they can find no sure footing, it is no wonder

that they raise questions and multiply disputes; which never coming to any clear resolution, are proper only to continue and increase their doubts, and to confirm them at last in perfect scepticism. Whereas, were the capacities of our understandings well considered, the extent of our knowledge once discovered, and the horizon found, which sets the bounds between the enlightened and dark parts of things; between what is, and what is not, comprehensible by us; men would, perhaps, with less scruple, acquiesce in the avowed ignorance of the one, and employ their thoughts and discourse, with more advantage and satisfaction in the other.

§ 8. *What idea stands for.*—Thus much I thought necessary to say concerning the occasion of this Inquiry into Human Understanding. But, before I proceed on to what I have thought on this subject, I must here in the entrance beg pardon of my reader for the frequent use of the word “idea,” which he will find in the following treatise. It being that term which, I think, serves best to stand for whatsoever is the object of the understanding when a man thinks; I have used it to express whatever is meant by phantasm, notion, species, or whatever it is, which the mind can be employed about in thinking; and I could not avoid frequently using it.*

I presume it will be easily granted me, that there are such ideas in men’s minds; every one is conscious of them in himself, and men’s words and actions will satisfy him that they are in others.

Our first inquiry then shall be, how they come into the mind.

* This modest apology of our author could not procure him the free use of the word *idea*: but great offence has been taken at it, and it has been censured as of dangerous consequence: to which you may see what he answers. “The world,”^a saith the Bishop of Worcester, “hath been strangely amused with *ideas* of late; and we have been told, that strange things might be done by the help of *ideas*; and yet these *ideas* at last, come to be only common notions of things, which we must make use of in our reasoning. You (i. e. the author of the Essay concerning Human Understanding) say in that chapter about the existence of God, you thought it most proper to express yourself in the most usual and familiar way, by common words and expressions. I would you had done so quite through your book; for then you had never given that occasion to the enemies of our faith, to take up your new way of *ideas*, as an effectual battery (as they imagined) against the mysteries of the Christian faith. But you might have enjoyed the satisfaction of your *ideas* long enough before I had taken notice of them, unless I had found them employed about doing mischief.”

To which our author^b replies, “It is plain that that which your lordship apprehends in my book may be of dangerous consequence to the article which your lordship has endeavoured to defend, is my introducing new terms; and that which your lordship instances in, is that of *ideas*. And the reason your lordship gives in every of these places why your lordship has such an apprehension of *ideas*, that they may be of dangerous consequence to that article of faith which your lordship has endeavoured to defend, is, because they have been applied to such purposes. And I might (your lordship says) have enjoyed the satisfaction of my *ideas* long enough, before you had taken notice of them, unless your lordship had found them employed in doing mischief. Which at last, as I humbly conceive, amounts to thus much, and no more, viz. that your lordship fears *ideas*, i. e. the term *ideas*, may, some time or other, prove of very dangerous consequence to what your lordship has endeavoured to defend, because they have been made use of in arguing against it. For I am sure your lordship does not mean, that you apprehend the things signified by *ideas*, may be of dangerous consequence to the article of faith your lordship endeavours to defend, because they have been made use of against it: for (besides that your lordship mentions *terms*) that would be to expect that those who oppose that article should oppose it without any thoughts; for the things signified by *ideas*, are nothing but the immediate objects of our minds in thinking; so that unless any one can oppose the article your lordship defends, without thinking on something, he must use the

^a Answer to Mr. Locke’s First Letter.

^b In his Second Letter to the Bishop of Worcester.

things signified by *ideas*; for he that thinks, must have some immediate object of his mind in thinking: i. e. must have *ideas*.

“But whether it be the name or the thing; *ideas* in sound, or *ideas* in signification; that your lordship apprehends may be of dangerous consequence to that article of faith which your lordship endeavours to defend; it seems to me, I will not say a new way of reasoning (for that belongs to me), but were it not your lordship’s, I should think it a very extraordinary way of reasoning, to write against a book, wherein your lordship acknowledges they are not used to bad purposes, nor employed to do mischief; only because you find that *ideas* are, by those who oppose your lordship, employed to do mischief; and so apprehend they may be of dangerous consequence to the article your lordship has engaged in the defence of. For whether *ideas* as terms, or *ideas* as the immediate objects of the mind, signified by those terms, may be, in your lordship’s apprehension, of dangerous consequences to that article; I do not see how your lordship’s writing against the notions of *ideas*, as stated in my book, will at all hinder your opposers from employing them in doing mischief, as before.

“However, be that as it will, so it is, that your lordship apprehends these new terms, these *ideas* with which the world hath, of late, been so strongly amused (though at last they come to be only common notions of things, as your lordship owns), may be of dangerous consequence to that article.

“My lord, if any, in answer to your lordship’s sermons, and in other pamphlets, wherein your lordship complains they have talked so much of *ideas*, have been troublesome to your lordship with that term; it is not strange that your lordship should be tired with that sound; but how natural soever it be to our weak constitutions, to be offended with any sound, wherewith an importunate din hath been made about our ears; yet, my lord, I know your lordship has a better opinion of the articles of our faith, than to think any of them can be overturned, or so much as shaken, with a breath formed into any sound or term whatsoever.

“Names are but the arbitrary marks of conception; and so they be sufficiently appropriated to them in their use. I know no other difference any of them have in particular, but as they are of easy or difficult pronunciation, and of a more or less pleasant sound; and what particular antipathies there may be in men, to some of them upon that account, it is not easy to be foreseen. This I am sure, no term whatsoever, in itself, bears, one more than another, any opposition to the truth of any kind; they are only propositions that do, or can, oppose the truth of any article or doctrine: and thus no term is privileged from being set in opposition to truth.

“There is no word to be found, which may not be brought into a proposition, wherein the most sacred and most evident truths may be opposed; but that is not a fault in the term, but him that uses it. And, therefore, I cannot easily persuade myself (whatever your lordship hath said in the heat of your concern) that you have bestowed so much pains upon my book, because the word *idea* is so much used there. For though upon my saying, in my chapter about the existence of God, ‘that I scarce use the word *idea* in that chapter,’ your lordship wishes that I had done so quite through my book. Yet I must rather look upon that as a compliment to me, wherein your lordship wished, that my book had been all through suited to vulgar readers, not used to that and the like terms, than that your lordship has such an apprehension of the word *idea*; or that there is any such harm in the use of it, instead of the word *notion* (with which your lordship seems to take it to agree in signification) that your lordship would think it worth your while to spend any part of your valuable time and thoughts about my book, for having the word *idea* so often in it; for this would be to make your lordship to write only against an impropriety of speech. I own to your lordship, it is a great condescension in your lordship to have done it, if that word have such a share in what your lordship has writ against my book, as some expressions would persuade one; and I would, for the satisfaction of your lordship, change the term of *idea* for a better, if your lordship, or any one, could help me to it. For, that *notion* will not so well stand for every immediate object of the mind in thinking, as *idea* does, I have (as I guess) somewhere given a reason in my book, by shewing that the term *notion* is more peculiarly appropriated to a certain sort of those objects, which I call mixed modes; and, I think, it would not sound altogether so well, to say, the *notion* of red, and the *notion* of a horse; as the *idea* of red, and the *idea* of a horse. But if any one thinks it will, I contend not: for I have no fondness for, no antipathy to, any particular articulate sounds: nor do I think there is any spell or fascination in any of them.

“But be the word *idea* proper or improper, I do not see how it is the better or the worse, because ill-men have made use of it, or because it has been made use of to bad purposes; for if that be a reason to condemn or lay it by, we must lay by the terms, *scripture*, *reason*, *perception*, *distinct*, *clear*, &c. Nay, the name of God himself will not escape; for I do not think any one of these, or any other term, can be produced, which hath not been made use of by such men, and to such purposes. And, therefore, if the Unitarians, in their late pamphlets, have talked very much of, and strangely amused the world with, *ideas*; I cannot believe your lordship will think that word one jot the worse, or the more dangerous, because they use it; any more than, for their use of them, you will think *reason* or *scripture* terms ill or

dangerous. And, therefore, what your lordship says, in the bottom of this 93d page, that I might have enjoyed the satisfaction of my *ideas* long enough before your lordship had taken notice of them, unless you had found them employed in doing mischief, will, I presume, when your lordship has considered again of this matter, prevail with your lordship to let me enjoy still the satisfaction I take in my *ideas*, i. e. as much satisfaction as I can take in so small a matter, as is the using of a proper term, notwithstanding it should be employed by others in doing mischief.

“For, my lord, if I should leave it wholly out of my book, and substitute the word *notion* every where in the room of it; and every body else should do so too (though your lordship does not, I suppose, suspect that I have the vanity to think they would follow my example), my book would, it seems, be the more to your lordship's liking; but I do not see how this would one jot abate the mischief your lordship complains of. For the Unitarians might as much employ *notions*, as they do now *ideas*, to do mischief; unless they are such fools to think they conjure with this notable word *idea*; and that the force of what they say, lies in the sound, and not in the signification of their terms.

“This I am sure of, that the truths of the Christian religion can be no more battered by one word than another; nor can they be beaten down or endangered by any sound whatsoever. And I am apt to flatter myself, that your lordship is satisfied that there is no harm in the word *ideas*, because you say, you should not have taken any notice of my *ideas*, if the enemies of our faith had not taken up my new way of *ideas*, as an effectual battery against the mysteries of the Christian faith. In which place, by new way of *ideas*, nothing, I think, can be construed to be meant, but my expressing myself by that of *ideas*, and not by other more common words, and of ancient standing in the English language.”

As to the objection of the author's way by *ideas* being a new way, he thus answers: “My new way by *ideas*, or my way by *ideas*, which often occurs in your lordship's letter, is, I confess a very large and doubtful expression; and may, in the full latitude, comprehend my whole essay; because, treating in it of the understanding, which is nothing but the faculty of thinking, I could not well treat of that faculty of the mind which consists in thinking, without considering the immediate objects of the mind in thinking, which I call *ideas*; and, therefore in treating of the understanding, I guess it will not be thought strange, that the greatest part of my book has been taken up in considering what these objects of the mind, in thinking, are; whence they come; what use the mind makes of them, in its several ways of thinking; and what are the outward marks, whereby it signifies them to others, or records them for its own use. And this, in short, is my way by *ideas*, that which your lordship calls my new way by *ideas*; which, my lord, if it be new, it is but a new history of an old thing. For I think it will not be doubted, that men always performed the actions of thinking, reasoning, believing, and knowing, just after the same manner that they do now; though whether the same account has heretofore been given of the way how they performed these actions, or wherein they consisted, I do not know. Were I as well read as your lordship, I should have been safe from that gentle reprimand of your lordship's, for thinking my way of *ideas* new, for want of looking into other men's thoughts, which appear in their books.

“Your lordship's words, as an acknowledgment of your instructions in the case, and as a warning to others, who will be so bold adventurers as to spin any thing barely out of their own thoughts, I shall set down at large; and they run thus: whether you took this way of *ideas* from the modern philosopher mentioned by you, is not at all material; but I intended no reflection upon you in it (for that you mean by my commending you as a scholar of so great a master). I never meant to take from you the honour of your own inventions; and I do believe you, when you say, that you wrote from your own thoughts, and the *ideas* you had there. But many things may seem new to one that converses only with his own thoughts, which really are not so; as he may find, when he looks into the thoughts of other men, which appear in their books. And therefore, although I have a just esteem for the invention of such, who can spin volumes barely out of their own thoughts; yet I am apt to think they would oblige the world more, if, after they had thought so much themselves, they would examine what thoughts others have had before them, concerning the same things; that so those may not be thought their own inventions which are common to themselves and others. If a man should try all the magnetical experiments himself, and publish them as his own thoughts, he might take himself to be the inventor of them. But he that examines them with what Gilbert and others have done before him, will not diminish the praise of his diligence, but may wish he had compared his thoughts with other men's; by which the world would receive greater advantage, although he lost the honour of being an original.

“To alleviate my fault herein, I agree with your lordship, that many things may seem new to one that converses only with his own thoughts, which really are not so; but I must crave leave to suggest to your lordship, that if in the spinning of them out of his own thoughts, they seem new to him, he is certainly the inventor of them; and they may as justly be thought his own invention, as any one's; and he is certainly the inventor of them, as any one who thought on them before him: the distinction of invention, or not invention,

lying not in thinking first, or not first, but in borrowing, or not borrowing, our thoughts from another; and he to whom, spinning them out of his own thoughts, they seem new, could not certainly borrow them from another. So he truly invented printing in Europe, who, without any communication with the Chinese, spun it out of his own thoughts; though it was never so true, that the Chinese had the use of printing, nay of printing in the very same way, among them, many ages before him. So that he that spins any thing out of his own thoughts, that seems new to him, cannot cease to think it his own invention, should he examine ever so far, what thoughts others have had before him, concerning the same thing, and should find by examining, that they had the same thoughts too.

“But what great obligation this would be to the world, or weighty case of turning over and looking into books, I confess I do not see. The great end to me, in conversing with my own or other men’s thoughts, in matters of speculation, is to find truth, without being much concerned whether my own spinning of it out of mine, or their spinning it out of their own thoughts, helps me to it. And how little I affect the honour of an original, may be seen at that place of my book, where, if any where, that itch of vain glory was likeliest to have shewn itself, had I been so over-run with it as to need a cure. It is where I speak of certainty, in these following words, taken notice of by your lordship, in another place: ‘I think I have shewn wherein it is that certainty, real certainty, consists, which, whatever it was to others, was, I confess, to me, heretofore, one of those *desiderata* which I found great want of.’

“Here, my lord, however new this seemed to me, and the more so because possibly I had in vain hunted for it in the books of others; yet I spoke of it as new, only to myself; leaving others in the undisturbed possession of what, either by invention, or reading, was theirs before; without assuming to myself any other honour, but that of my own ignorance, until that time, if others before had shewn wherein certainty lay. And yet, my lord, if I had upon this occasion been forward to assume to myself the honour of an original, I had been pretty safe in it; since I should have had your lordship for my guarantee and vindicator in that point, who are pleased to call it new; and, as such, to write against it.

“And truly, my lord, in this respect, my book has had very unlucky stars, since it hath had the misfortune to displease your lordship, with many things in it for their novelty; as, *new way of reasoning; new hypothesis about reason; new sort of certainty; new terms; new way of ideas; new method of certainty, &c.* And yet, in other places, your lordship seems to think it worthy in me of your lordship’s reflection, for saying but what others have said before; as where I say, ‘In the different make of men’s tempers, and application of their thoughts, some arguments prevail more on one, and some on another, for the confirmation of the same truth;’ your lordship asks, ‘What is this different from what all men of understanding have said?’ Again, I take it, your lordship meant not these words for a commendation of my book, where you say, ‘But if no more be meant by ‘The simple *ideas* that come in by sensation or reflection, and their being the foundation of our knowledge,’ but that our notions of things come in, either from our senses, or the exercise of our minds: as there is nothing extraordinary in the discovery, so your lordship is far enough from opposing that, wherein you think all mankind are agreed.

“And again, but what need all this great noise about *ideas* and *certainty*, true and real *certainty* by *ideas*; if, after all, it comes only to this, that our *ideas* only represent to us such things, from whence we bring arguments to prove the truth of things?

“But the world has been strangely amused with *ideas* of late; and we have been told, that strange things might be done by the help of *ideas*, and yet these *ideas*, at last, come to be only common notions of things, which we must make use of in our reasoning. And to the like purpose in other places.

“Whether, therefore, at last, your lordship will resolve that it is new or no; or more faulty by its being new, must be left to your lordship. This I find by it, that my book cannot avoid being condemned on the one side, or the other; nor do I see a possibility to help it. If there be readers that like only new thoughts; or, on the other side, others that can bear nothing but what can be justified by received authorities in print; I must desire them to make themselves amends in that part which they like, for the displeasure they receive in the other: but if any should be so exact, as to find fault with both, truly I know not what to say to them. The case is a plain case; the book is all over nought, and there is not a sentence in it, that is not, either from its iniquity or novelty, to be condemned; and so there is a short end of it. From your lordship indeed, in particular, I can hope for something better; for your lordship thinks the general design of it so good, that this, I flatter myself, would prevail on your lordship to preserve it from the fire.

“But as to the way your lordship thinks I should have taken to prevent the having it thought my invention, when it was common to me with others, it unluckily so fell out, in subjects of my Essay of Human Understanding, that I could not look into the thoughts of other men to inform myself. For my design being, as well as I could, to copy nature, and to give an account of the operations of the mind in thinking, I could look into nobody’s understanding but my own, to see how it wrought; nor have a prospect into other men’s minds, to view their thoughts there; and observe what steps and motions they took, and

by what gradations, they proceeded in their acquainting themselves with truth, and their advance in knowledge : what we find of their thoughts in books, is but the result of this; and not the progress and working of their minds, in coming to the opinions and conclusions they set down and published.

“All, therefore, that I can say of my book is, that it is a copy of my own mind, in its several ways of operation. And all that I can say for the publishing of it, is, that I think the intellectual faculties are made, and operate alike in most men; and that some that I shewed it to before I published it, liked it so well, that I was confirmed in that opinion. And, therefore, if it should happen that it should not be so, but that some men should have ways of thinking, reasoning, or arriving at certainty, different from others, and above those that I find my mind to use and acquiesce in, I do not see of what use my book can be to them. I can only make it my humble request, in my own name, and in the name of those that are of my size, who find their minds work, reason, and know in the same low way that mine does, that those men of a more happy genius would shew us the way of their nobler flights; and particularly would discover to us their shorter or surer way to certainty, than by *ideas*, and the observing their agreement or disagreement.

“Your lordship adds, ‘But now it seems, nothing is intelligible but what suits with the new ways of *ideas*.’ My lord, the new way of *ideas*, and the old way of speaking intelligibly,^a was always, and ever will be, the same: and if I may take the liberty to declare my sense of it, herein it consists, 1. That a man use no words but such as he makes the sign of certain determined objects of his mind in thinking, which he can make known to another. 2. Next, That he use the same word steadily for the sign of the same immediate object of his mind in thinking. 3. That he join those words together in propositions, according to the grammatical rules of that language he speaks in. 4. That he unite those sentences into a coherent discourse. Thus, and thus only, I humbly conceive any one may preserve himself from the confines and suspicion of jargon, whether he pleases to call those immediate objects of his mind, which his words do, or should stand for, *ideas* or no.”

^a Mr. Locke's Third Letter to the Bishop of Worcester.

CHAP. II.

NO INNATE PRINCIPLES IN THE MIND.

§ 1. *The way shewn how we come by any knowledge, sufficient to prove it not innate.*—It is an established opinion amongst some men, that there are in the understanding certain innate principles; some primary notions. *Κοινὰ ἔννοια*, characters, as it were, stamped upon the mind of man, which the soul receives in its very first being; and brings into the world with it. It would be sufficient to convince unprejudiced readers of the falseness of this supposition, if I should only shew (as I hope I shall in the following parts of this discourse) how men, barely by the use of their natural faculties, may attain to all the knowledge they have, without the help of any innate impressions; and may arrive at certainty, without any such original notions or principles. For I imagine any one will easily grant, that it would be impertinent to suppose, the ideas of colour innate in a creature, to whom God hath given sight and a power to receive them by the eyes of external objects; and no less unreasonable would it be to attribute several truths to the impressions of nature, and innate characters, when we may observe in ourselves faculties fit to attain an easy and certain knowledge of them, as if they were originally imprinted on the mind.

But because a man is not permitted without censure to follow his own thoughts in the search of truth, when they lead him ever so little out of the common road, I shall set down the reasons that made me doubt of the truth of that opinion, as an excuse for my mistake, if I be in one; which I leave to be considered by those who, with me, dispose themselves to embrace truth, wherever they find it.

§ 2. *General assent, the great argument.*—There is nothing more commonly taken for granted, than that there are certain principles, both speculative and practical (for they speak of both), universally agreed upon by all mankind; which, therefore, they argue, must needs be constant impressions, which the souls of men receive in their first beings, and which they bring into the world with them, as necessarily and really as they do any of their inherent faculties.

§ 3. *Universal consent proves nothing innate.*—This argument, drawn from universal consent, has this misfortune in it, that if it were true in matter of fact, that there were certain truths, wherein all mankind agreed, it would not prove them innate, if there can be any other way shewn, how men may come to that universal agreement, in the things they do consent in; which I presume may be done.

§ 4. *“What is, is;” and “it is impossible for the same thing to be, and not to be,” not universally assented to.*—But, which is worse, this argument of universal consent, which is made use of to prove innate principles, seems to me a demonstration that there are none such; because there are none to which all mankind give a universal assent. I shall begin with the speculative, and instance in those magnified principles of demonstration, “whatsoever is, is;” and “it is impossible for the same thing to be, and not to be,” which, of all others, I think have the most allowed title to innate. These have so settled a reputation of maxims universally received, that it will, no doubt, be thought strange if any one should seem to question it. But yet I take liberty to say, that these propositions are so far from having a universal assent, that there are a great part of mankind to whom they are not so much as known.

§ 5. *Not on the mind naturally imprinted, because not known to children, idiots, &c.*—For, first, it is evident, that all children and idiots have not the least apprehension or thought of them: and the want of that is enough to destroy that universal assent, which must needs be the necessary concomitant of all innate truths: it seeming to me near a contradiction, to say, that there are truths imprinted on the soul, which it perceives or understands not: imprinting, if it signifies any thing, being nothing else but the making certain truths to be perceived. For to imprint any thing on the mind, without the mind’s perceiving it, seems to me hardly intelligible. If, therefore, children and idiots have souls, have minds, with those impressions upon them, they must unavoidably perceive them, and necessarily know and assent to these truths; which, since they do not, it is evident that there are no such impressions. For if they are not notions naturally imprinted, how can they be innate? and if they are notions imprinted, how can they be unknown? to say a notion is imprinted on the mind, and yet at the same time to say that the mind is ignorant of it, and never yet took notice of it, is to make this impression nothing. No proposition can be said to be in the mind, which it never yet knew, which it was never yet conscious of. For if any one may, then, by the same reason, all propositions that are true, and the mind is capable ever of assenting to, may be said to be in the mind, and to be imprinted: since, if any one can be said to be in the mind, which it never yet knew, it must be only because it is capable of knowing it, and so the mind is of all truths

it ever shall know. Nay, thus truths may be imprinted on the mind, which it never did, nor ever shall know : for a man may live long, and die at last in ignorance of many truths, which his mind was capable of knowing, and that with certainty. So that, if the capacity of knowing be the natural impression counted for, all the truths a man ever comes to know, will, by this account, be every one of them innate ; and this great point will amount to no more, but only to a very improper way of speaking ; which, whilst it pretends to assert the contrary, says nothing different from those who deny innate principles. For nobody, I think, ever denied that the mind was capable of knowing several truths. The capacity, they say, is innate ; the knowledge, acquired. But then, to what end such contest for certain innate maxims ? if truths can be imprinted on the understanding without being perceived, I can see no difference there can be between any truths the mind is capable of knowing in respect of their original ; they must all be innate, or all adventitious : in vain shall a man go about to distinguish them. He, therefore, that talks of innate notions in the understanding, cannot (if he intend thereby any distinct sort of truths) mean such truths to be in the understanding, as it never perceived, and is yet wholly ignorant of. For if these words (to be in the understanding) have any propriety, they signify to be understood ; so that, to be in the understanding, and not to be understood ; to be in the mind, and never to be perceived, is all one, as to say, any thing is, and is not, in the mind or understanding. If, therefore, these two propositions, “ whatsoever is, is ;” and, “ it is impossible for the same thing to be, and not to be,” are by nature imprinted, children cannot be ignorant of them ; infants, and all that have souls, must necessarily have them in their understandings, know the truth of them, and assent to it.

§ 6. *That men know them when they come to the use of reason, answered.*—To avoid this, it is usually answered, that all men know and assent to them, when they come to the use of reason, and this is enough to prove them innate. I answer,

§ 7. Doubtful expressions, that have scarce any signification, go for clear reasons, to those who, being prepossessed, take not the pains to examine even what they themselves say. For to apply this answer with any tolerable sense to our present purpose, it must signify one of these two things ; either, that as soon as men come to the use of reason, these supposed native inscriptions come to be known, and observed by them : or else, that the use and exercise of men’s reason assists them in the discovery of these principles, and certainly makes them known to them.

§ 8. *If reason discovered them, that would not prove them innate.*—If they mean, that, by the use of reason, men may discover these principles, and that this is sufficient to prove them innate, their way of arguing will stand thus, viz. That whatever truths reason can certainly discover to us, and make us firmly assent to, those are all naturally imprinted on the mind ; since that universal assent which is made the mark of them, amounts to no more but this ; that by the use of reason, we are capable to come to a certain knowledge of, and assent to, them ; and by this means there will be no difference between the maxims of the mathematicians, and theorems they deduce from them ; all must be

equally allowed innate ; they being all discoveries made by the use of reason, and truths that a rational creature may certainly come to know, if he apply his thoughts rightly that way.

§ 9. *It is false that reason discovers them.*—But how can these men think the use of reason necessary to discover principles that are supposed innate, when reason (if we may believe them) is nothing else but the faculty of deducing unknown truths from principles or propositions that are already known ? That certainly can never be thought innate, which we have need of reason to discover, unless, as I have said, we will have all the certain truths that reason ever teaches us, to be innate. We may as well think the use of reason necessary to make our eyes discover visible objects, as that there should be the need of reason, or the exercise thereof, to make the understanding see what is originally engraven in it, and cannot be on the understanding, before it be perceived by it. So that to make reason discover those truths thus imprinted, is to say, that the use of reason discovers to a man what he knew before ; and if men have those innate impressed truths originally, and before the use of reason, and yet are always ignorant of them, till they come to the use of reason, it is in effect to say, that men know, and know them not, at the same time.

§ 10. It will perhaps be said, that mathematical demonstrations, and other truths, that are not innate, are not assented to, as soon as proposed, wherein they are distinguished from these maxims, and other innate truths. I shall have occasion to speak of assent, upon the first proposing, more particularly by and by. I shall here only, and that very readily, allow, that these maxims, and mathematical demonstrations, are in this different ; that the one has need of reason, using of proofs, to make them out, and to gain our assent ; but the other, as soon as understood, are, without any the least reasoning, embraced and assented to. But I withal beg leave to observe, that it lays open the weakness of this subterfuge, which requires the use of reason for the discovery of these general truths : since it must be confessed, that in their discovery, there is no use made of reasoning at all. And I think those who give this answer, will not be forward to affirm, that the knowledge of this maxim, “That it is impossible for the same thing to be, and not to be,” is a deduction of our reason. For this would be to destroy that bounty of nature they seem so fond of, whilst they make the knowledge of those principles to depend on the labour of our thoughts. For all reasoning is search, and casting about, and requires pains and application. And how can it with any tolerable sense be supposed, that what was imprinted by nature, as the foundation and guide of our reason, should need the use of reason to discover it ?

§ 11. Those who will take the pains to reflect with a little attention on the operations of the understanding, will find that this ready assent of the mind to some truths, depends not either on native inscription, or the use of reason ; but on a faculty of the mind quite distinct from both of them, as we shall see hereafter. Reason, therefore, having nothing to do in procuring our assent to these maxims, if by saying, that men know and assent to them, when they come to the use of reason, be meant, that the use of reason assists us in the knowledge of

these maxims, it is utterly false; and were it true would prove them not to be innate.

§ 12. *The coming to the use of reason, not the time we come to know these maxims.*—If by knowing and assenting to them, when we come to the use of reason, be meant, that this is the time when they come to be taken notice of by the mind; and that as soon as children come to the use of reason, they come also to know and assent to these maxims; this also is false and frivolous. *First.* It is false, because it is evident these maxims are not in the mind so early as the use of reason; and, therefore, the coming to the use of reason is falsely assigned as the time of their discovery. How many instances of the use of reason may we observe in children, long time before they have any knowledge of this maxim, “that it is impossible for the same thing to be, and not to be?” And a great part of illiterate people, and savages, pass many years, even of their rational age, without ever thinking on this and the like general propositions. I grant, men come not to the knowledge of these general and more abstract truths, which are thought innate, till they come to the use of reason; and I add, nor then neither. Which is so, because till after they come to the use of reason, those general abstract ideas are not framed in the mind, about which those general maxims are, which are mistaken for innate principles, but are indeed discoveries made, and verities introduced, and brought into the mind by the same way, and discovered by the same steps, as several other propositions, which nobody was ever so extravagant as to suppose innate. This I hope to make plain in the sequel of this discourse. I allow, therefore, a necessity that men should come to the use of reason, before they get the knowledge of those general truths; but deny, that men’s coming to the use of reason, is the time of their discovery.

§ 13. *By this, they are not distinguished from other knowable truths.*—In the mean time it is observable, that this saying, That men know and assent to these maxims, when they come to the use of reason, amounts, in reality of fact, to no more but this, that they are never known nor taken notice of, before the use of reason, but may possibly be assented to some time after, during a man’s life; but when, is uncertain; and so may all other knowable truths, as well as these; which, therefore, have no advantage nor distinction from others, by this note of being known when we come to the use of reason; nor are thereby proved to be innate, but quite the contrary.

§ 14. *If coming to the use of reason were the time of their discovery, it would not prove them innate.*—But, *secondly*, were it true, that the precise time of their being known, and assented to, were, when men come to the use of reason, neither would that prove them innate. This way of arguing is as frivolous, as the supposition itself is false. For by what kind of logic will it appear, that any notion is originally by nature imprinted in the mind in its first constitution, because it comes first to be observed and assented to, when a faculty of the mind, which has quite a distinct province, begins to exert itself? and, therefore, the coming to the use of speech, if it were supposed the time that these maxims are first assented to (which it may be with as much truth, as

the time when men come to the use of reason) would be as good a proof that they were innate, as to say, they are innate, because men assent to them when they come to the use of reason. I agree then with these men of innate principles, that there is no knowledge of these general and self-evident maxims in the mind, till it comes to the exercise of reason: but I deny that the coming to the use of reason, is the precise time when they are first taken notice of; and if that were the precise time, I deny that it would prove them innate. All that can with any truth be meant by this proposition, that men assent to them when they come to the use of reason, is no more but this, that the making of general abstract ideas, and the understanding of general names, being a concomitant of the rational faculty, and growing up with it, children commonly get not those general ideas, nor learn the names that stand for them, till having for a good while exercised their reason about familiar and more particular ideas, they are, by their ordinary discourse and actions with others, acknowledged to be capable of rational conversation. If assenting to these maxims, when men come to the use of reason, can be true in any other sense, I desire it may be shown; or at least, how in this, or any other sense, it proves them innate.

§ 15. *The steps by which the mind attains several truths.*—The senses at first let in particular ideas, and furnish the yet empty cabinet, and the mind by degrees growing familiar with some of them, they are lodged in the memory, and names got to them. Afterwards the mind proceeding farther, abstracts them, and by degrees learns the use of general names. In this manner the mind comes to be furnished with ideas and language, the materials about which to exercise the discursive faculty; and the use of reason becomes daily more visible, as these materials that give it employment, increase. But, though the having of general ideas, and the use of general words and reason, usually grow together, yet I see not how this any way proves them innate. The knowledge of some truths, I confess, is very early in the mind; but in a way that shows them not to be innate. For if we will observe, we shall find it still to be about ideas not innate, but acquired; it being about those first, which are imprinted by external things, with which infants have earliest to do, which make the most frequent impressions on their senses. In ideas thus got, the mind discovers, that some agree, and others differ, probably as soon as it has any use of memory; as soon as it is able to retain and perceive distinct ideas. But whether it be then, or no, this is certain, it does so long before it has the use of words, or comes to that, which we commonly call “the use of reason.” For a child knows as certainly, before it can speak, the difference between the ideas of sweet and bitter (i. e. that sweet is not bitter), as it knows afterwards (when it comes to speak) that wormwood and sugar-plums are not the same thing.

§ 16. A child knows not that three and four are equal to seven, until he comes to be able to count to seven, and has got the name and idea of equality; and then upon explaining those words, he presently assents to, or rather perceives the truth of that proposition. But neither does he then readily assent, because it is an innate truth, nor was his assent wanting till then, because he wanted the use of reason; but the truth

of it appears to him, as soon as he has settled in his mind the clear and distinct ideas that these names stand for; and then he knows the truth of that proposition, upon the same grounds, and by the same means, that he knew before, that a rod and a cherry are not the same thing; and upon the same grounds also, that he may come to know afterwards, "that it is impossible for the same thing to be, and not to be," as shall be more fully shewn hereafter. So that the later it is before any one comes to have those general ideas about which those maxims are; or to know the signification of those general terms that stand for them; or to put together in his mind the ideas they stand for: the later also will it be before he comes to assent to those maxims, whose terms, with the ideas they stand for, being no more innate than those of a cat or a weasel, he must stay till time and observation have acquainted him with them; and then he will be in a capacity to know the truth of these maxims, upon the first occasion that shall make him put together those ideas in his mind, and observe whether they agree or disagree, according as is expressed in those propositions. And, therefore, it is, that a man knows that eighteen and nineteen are equal to thirty-seven, by the same self-evidence that he knows one and two to be equal to three; yet a child knows this not so soon as the other; not for want of the use of reason, but because the ideas the words eighteen, nineteen, and thirty-seven stand for, are not so soon got, as those which are signified by one, two, and three.

§ 17. *Assenting, as soon as proposed and understood, proves them not innate.*—This evasion, therefore, of general assent when men come to the use of reason, failing as it does, and leaving no difference between those supposed innate, and other truths, that are afterwards acquired and learnt, men have endeavoured to secure an universal assent to those they call maxims, by saying, they are generally assented to as soon as proposed, and the terms they are proposed in understood: seeing all men, even children, as soon as they hear and understand the terms, assent to these propositions, they think it is sufficient to prove them innate. For since men never fail, after they have once understood the words, to acknowledge them for undoubted truths, they would infer that certainly these propositions were first lodged in the understanding, which, without any teaching, the mind, at the very first proposal, immediately closes with and assents to, and after that never doubts again.

§ 18. *If such an assent be a mark of innate, then "that one and two are equal to three; that sweetness is not bitterness;" and a thousand the like, must be innate.*—In answer to this, I demand whether "ready assent given to a proposition upon first hearing and understanding the terms, be a certain mark of innate principle?" If it be not, such a general assent is in vain urged as a proof of them: if it be said that it is a mark of innate, they must then allow all such propositions to be innate which are generally assented to as soon as heard, whereby they will find themselves plentifully stored with innate principles. For upon the same ground, viz. of assenting at first hearing and understanding the terms, that men would have those maxims pass for innate, they must also admit several propositions about numbers, to be innate: and thus, that one and two, are equal to three; that two and two are equal

to four; and a multitude of other the like propositions in numbers, that every body assents to at first hearing and understanding the terms, must have a place amongst these innate axioms. Nor is this the prerogative of numbers alone, and propositions made about several of them; but even natural philosophy, and all the other sciences, afford propositions which are sure to meet with assent as soon as they are understood. That two bodies cannot be in the same place, is a truth that nobody any more sticks at, than at these maxims. "That it is impossible for the same thing to be, and not to be; that white is not black; that a square is not a circle; and that yellowness is not sweetness;" these, and a million of such other propositions, as many, at least, as we have distinct ideas of, every man in his wits, at first hearing and knowing what the names stand for, must necessarily assent to. If these men will be true to their own rule, and have assent at first hearing and understanding the terms to be a mark of innate, they must allow not only as many innate propositions as men have distinct ideas, but as many as men can make propositions wherein different ideas are denied one of another. Since every proposition, wherein one different idea is denied of another, will as certainly find assent at first hearing and understanding the terms, as this general one, "it is impossible for the same thing to be and not to be;" or that which is the foundation of it, and is the easier understood of the two, "the same is not different:" by which account they will have legions of innate propositions of this sort, without mentioning any other. But since no proposition can be innate, unless the ideas about which it is, be innate; this will be to suppose all our ideas of colours, sounds, tastes, figure, &c., innate; than which, there cannot be any thing more opposite to reason and experience. Universal and ready assent upon hearing and understanding the terms, is (I grant) a mark of self-evidence; but self-evidence, depending not on innate impressions, but on something else (as we shall shew hereafter), belongs to several propositions, which nobody was yet so extravagant as to pretend to be innate.

§ 19. *Such less general propositions known before these universal maxims.*—Nor let it be said, that those more particular self-evident propositions, which are assented to at first hearing, as, that one and two are equal to three, that green is not red, &c., are received as the consequence of those more universal propositions, which are looked on as innate principles; since any one, who will but take the pains to observe what passes in the understanding, will certainly find that these, and the like less general propositions, are certainly known, and firmly assented to, by those who are utterly ignorant of those more general maxims; and, so being earlier in the mind than those (as they are called) first principles, cannot owe to them the assent wherewith they are received at first hearing.

§ 20. *One and one equal to two, &c. not general nor useful, answered.*—If it be said, that "these propositions, viz. two and two are equal to four; red is not blue, &c. are not general maxims, nor of any great use;" I answer, that makes nothing to the argument of universal assent, upon hearing and understanding. For if that be the certain mark of innate, whatever proposition can be found that receives general

assent as soon as heard and understood, that must be admitted for an innate proposition, as well as this maxim, "that it is impossible for the same thing to be, and not to be," they being, upon this ground, equal. And as to the difference of being more general, that makes this maxim more remote from being innate; those general abstract ideas being more strangers to our first apprehensions, than those of more particular self-evident propositions; and, therefore, it is longer before they are admitted and assented to by the growing and understanding. And as to the usefulness of these magnified maxims, that perhaps will not be found so great as is generally conceived, when it comes in its due place to be more fully considered.

§ 21. *These maxims not being known sometimes until proposed, proves them not innate.*—But we have not yet done with assenting to propositions at first hearing and understanding their terms; it is fit we first take notice, that this, instead of being a mark that they are innate, is a proof of the contrary; since it supposes that several, who understand and know other things, are ignorant of these principles, until they are proposed to them; and that one may be unacquainted with these truths, until he hears them from others. For if they were innate, what need they be proposed, in order to gain assent; when, by being in the understanding, by a natural and original impression (if there were any such), they could not but be known before? Or doth the proposing them, print them clearer in the mind than nature did? If so, then the consequence will be, that a man knows them better after he has been thus taught them, than he did before. Whence it will follow, that these principles may be made more evident to us by others' teaching, than nature has made them by impression; which will ill agree with the opinion of innate principles, and give but little authority to them; but, on the contrary, makes them unfit to be the foundations of all our other knowledge, as they are pretended to be. This cannot be denied, that men grow first acquainted with many of these self-evident truths, upon their being proposed; but it is clear, that whosoever does so, finds in himself that he then begins to know a proposition which he knew not before; and which from thenceforth he never questions; not because it was innate, but because the consideration of the nature of the things contained in those words, would not suffer him to think otherwise, how, or whensoever, he is brought to reflect on them. And if whatever is assented to at first hearing and understanding the terms, must pass for an innate principle, every well-grounded observation, drawn from particulars into a general rule, must be innate. When yet it is certain, that not all, but only sagacious heads, light at first on these observations, and reduce them into general propositions, not innate, but collected from a preceding acquaintance and reflection on particular instances. These when observing men have made them, unobserving men, when they are proposed to them, cannot refuse their assent to.

§ 22. *Implicitly known before proposing, signifies that the mind is capable of understanding them, or else signifies nothing.*—If it be said, "the understanding hath an implicit knowledge of these principles, but not an explicit, before this first hearing," (as they must, who will say, "that they are in the understanding before they are known")

it will be hard to conceive what is meant by a principle imprinted on the understanding implicitly; unless it be this, that the mind is capable of understanding and assenting firmly to such propositions. And thus all mathematical demonstrations, as well as first principles, must be received as native impressions on the mind; which, I fear, they will scarce allow them to be, who find it harder to demonstrate a proposition, than assent to it when demonstrated. And few mathematicians will be forward to believe that all the diagrams they have drawn, were but copies of those innate characters which nature had engraven upon their minds.

§ 23. *The argument of assenting on first hearing, is upon a false supposition of no precedent teaching.*—There is, I fear, this further weakness in the foregoing argument, which would persuade us, that, therefore, those maxims are to be thought innate, which men admit at first hearing, because they assent to propositions which they are not taught, nor do receive from the force of any argument or demonstration but a bare explication or understanding of the terms. Under which, there seems to me to lie this fallacy; that men are supposed not to be taught, nor to learn any thing *de novo*; when in truth, they are taught, and do learn something they were ignorant of before. For, *first*, it is evident that they have learned the terms and their signification: neither of which was born with them. But this is not all the acquired knowledge in the case; the ideas themselves, about which the proposition is, are not born with them, no more than their names, but got afterward. So that in all propositions that are assented to at first hearing, the terms of the proposition, their standing for such ideas, and the ideas themselves that they stand for, being neither of them innate, I would fain know what there is remaining in such propositions that is innate. For I would gladly have any one name that proposition whose terms or ideas were either of them innate. We, by degrees, get ideas and names, and learn their appropriated connexion one with another; and then to propositions made in such terms, whose signification we have learnt, and wherein the agreement or disagreement we can perceive in our ideas, when put together, is expressed, we at first hearing assent; though to other propositions, in themselves as certain and evident, but which are concerning ideas not so soon or easily got, we are at the same time no way capable of assenting. For though a child quickly assents to this proposition, that an “apple is not fire,” when, by familiar acquaintance, he has got the ideas of those two different things distinctly imprinted on his mind, and has learnt that the names apple and fire stand for them, yet it will be some years after, perhaps, before the same child will assent to this proposition, “That it is impossible for the same thing to be, and not to be;” because that, though, perhaps, the words are as easy to be learnt, yet the signification of them being more large, comprehensive, and abstract, than of the names annexed to those sensible things the child hath to do with, it is longer before he learns their precise meaning, and it requires more time plainly to form in his mind those general ideas they stand for. Until that be done, you will in vain endeavour to make any child assent to a proposition made up of such general terms; but as

soon as ever he has got those ideas, and learned their names, he forwardly closes with the one, as well as the other, of the fore-mentioned propositions, and with both for the same reason; viz., because he finds the ideas he has in his mind to agree or disagree, according as the words standing for them are affirmed or denied one of another in the proposition. But if propositions be brought to him in such words, which stand for ideas he has not yet in his mind, to such propositions, however evidently true or false in themselves, he affords neither assent nor dissent, but is ignorant. For words being but empty sounds, any farther than they are signs of our ideas, we cannot but assent to them as they correspond to those ideas we have, but no farther than that. But the shewing by what steps and ways knowledge comes into our minds, and the grounds of several degrees of assent, being the business of the following discourse, it may suffice to have only touched on it here, as one reason that made me doubt of those innate principles.

§ 24. *Not innate, because not universally assented to.*—To conclude this argument of universal consent, I agree with these defenders of innate principles, that if they are innate, they must needs have universal assent. For that a truth should be innate, and yet not assented to, is to me as unintelligible, as for a man to know a truth, and be ignorant of it at the same time. But then, by these men's own confession, they cannot be innate: since they are not assented to by those who understand not the terms, nor by a great part of those who do understand them, but have yet never heard nor thought of those propositions, which, I think, is at least one half of mankind. But were the number far less, it would be enough to destroy universal assent, and thereby shew these propositions not to be innate, if children alone were ignorant of them.

§ 25. *These maxims not the first known.*—But that I may not be accused to argue from the thoughts of infants, which are unknown to us, and to conclude from what passes in their understandings before they express it, I say next, that these two general propositions are not the truths that first possess the minds of children, nor are antecedent to all acquired and adventitious notions, which, if they were innate, they must needs be. Whether we can determine it or no, it matters not, there is certainly a time when children begin to think, and their words and actions do assure us that they do so. When, therefore, they are capable of thought, of knowledge, of assent, can it rationally be supposed they can be ignorant of those notions that nature has imprinted, were there any such? Can it be imagined, with any appearance of reason, that they perceive the impressions from things without, and be, at the same time, ignorant of those characters which are supposed woven into the very principles of their being, and imprinted there in indelible characters, to be the foundation and guide of all their acquired knowledge, and future reasonings? This would be to make nature take pains to no purpose; or, at least, to write very ill, since its characters could not be read by those eyes which saw other things very well; and those are very ill supposed the clearest parts of truth, and the foundations of all our knowledge, which are not first known, and without which, the undoubted knowledge of several other things may be had. The child

certainly knows that the nurse that feeds it, is neither the cat it plays with, nor the blackmoor it is afraid of; that the wormseed or mustard it refuses, is not the apple or sugar it cries for; this it is certainly and undoubtedly assured of; but will any one say, it is by virtue of this principle, "that it is impossible for the same thing to be, and not to be," that it so firmly assents to these, and other parts of its knowledge? Or that the child has any notion or apprehension of that proposition at an age, wherein yet it is plain it knows a great many other truths? He that will say, children join in these abstract speculations with their sucking-bottles and their rattles, may, perhaps, with justice, be thought to have more passion and zeal for his opinion, but less sincerity and truth, than one of that age.

§ 26. *And so not innate.*—Though, therefore, there be several general propositions that meet with constant and ready assent, as soon as proposed to men grown up, who have attained the use of more general and abstracted ideas, and names standing for them; yet they not being to be found in those of tender years, who nevertheless know other things, they cannot pretend to universal assent of intelligent persons, and so by no means can be supposed innate; it being impossible that any truth which is innate (if there were any such) should be unknown, at least to any one who knows any thing else. Since if they are innate truths, there must be innate thoughts; there being nothing a truth in the mind that it has never thought on. Whereby it is evident, if there be any innate truths in the mind, they must necessarily be the first of any thought on; the first that appear there.

§ 27. *Not innate, because they appear least, where what is innate shews itself clearest.*—That the general maxims we are discoursing of, are not known to children, idiots, and a great part of mankind, we have already sufficiently proved; whereby it is evident they have not a universal assent, nor are general impressions. But there is this farther argument in it against their being innate: that these characters, if they were native and original impressions, should appear fairest and clearest in those persons, in whom yet we find no footsteps of them: and it is, in my opinion, a strong presumption that they are not innate, since they are least known to those, in whom, if they were innate, they must needs exert themselves with most force and vigour. For children, idiots, savages, and illiterate people, being of all others the least corrupted by custom, or borrowed opinions, learning and education having not cast their native thoughts into new moulds, nor by superinducing foreign and studied doctrines, confounded those fair characters nature had written there; one might reasonably imagine, that in their minds, these innate notions should lie open fairly to every one's view, as it is certain the thoughts of children do. It might very well be expected that these principles should be perfectly known to naturals, which being stamped immediately on the soul (as these men suppose), can have no dependence on the constitution or organs of the body, the only confessed difference between them and others. One would think, according to these men's principles, that all these native beams of light (were there any such) should, in those who have no reserves, no arts of concealment, shine out in their full lustre, and leave us in no more doubt

of their being there, than we are of their love of pleasure, and abhorrence of pain. But, alas! among children, idiots, savages, and the grossly illiterate, what general maxims are to be found? What universal principles of knowledge? Their notions are few and narrow, borrowed only from those they have had most to do with, and which have made upon their senses the frequentest and strongest impressions. A child knows his nurse and his cradle, and, by degrees, the playthings of a little more advanced age; and a young savage has, perhaps, his head filled with love and hunting, according to the fashion of his tribe. But he that from a child untaught, or a wild inhabitant of the woods, will expect these abstract maxims and reputed principles of sciences, will, I fear, find himself mistaken. Such kind of general propositions are seldom mentioned in the huts of Indians, much less are they to be found in the thoughts of children, or any impressions of them on the minds of naturals. They are the language and business of the schools and academies of learned nations, accustomed to that sort of conversation, or learning, where disputes are frequent; these maxims being suited to artificial argumentation, and useful for conviction, but not much conducing to the discovery of truth, or the advancement of knowledge. But of their small use for the improvement of knowledge I shall have occasion to speak more at large, l. 4. c. 7.

§ 28. *Recapitulation.*—I know not how absurd this may seem to the masters of demonstration; and probably it will hardly down with any body at first hearing. I must, therefore, beg a little truce with prejudice, and the forbearance of censure, until I have been heard out in the sequel of this discourse, being very willing to submit to better judgments. And since I impartially search after truth, I shall not be sorry to be convinced that I have been too fond of my own notions, which, I confess, we are all apt to be, when application and study have warmed our heads with them.

Upon the whole matter, I cannot see any ground to think these two speculative maxims innate, since they are not universally assented to; and the assent they so generally find, is no other than what several propositions, not allowed to be innate, equally partake it with them: and since the assent that is given them is produced another way, and comes not from natural inscription, as I doubt not but to make appear in the following discourse. And if these first principles of knowledge and science are found not to be innate, no other speculative maxims can (I suppose) with better right pretend to be so.

CHAPTER III.

NO INNATE PRACTICAL PRINCIPLES.

§ 1. *No moral principles so clear and so generally received as the forementioned speculative maxims.*—If those speculative maxims, whereof we discoursed in the foregoing chapter, have not an actual universal reception: and I think it will be hard to instance any one moral rule which can pretend to so general and ready an assent as, “what is, is;” or to be so manifest a truth as this, “that it is impossible for the same

thing to be, and not to be." Whereby it is evident, that they are farther removed from a title to be innate; and the doubt of their being native impressions on the mind, is stronger against those moral principles than the other. Not that it brings their truth at all in question; they are equally true, though not equally evident. Those speculative maxims carry their own evidence with them; but moral principles require reasoning and discourse, and some exercise of the mind, to discover the certainty of their truth. They lie not open as natural characters engraven on the mind, which if any such were, they must needs be visible by themselves, and by their own light, be certain and known to every body. But this is no derogation to truth and certainty; no more than it is to the truth or certainty of the three angles of a triangle being equal to two right ones, because it is not so evident as the whole is bigger than a part; nor so apt to be assented to at first hearing. It may suffice, that these moral rules are capable of demonstration; and, therefore, it is our own fault, if we come not to a certain knowledge of them. But the ignorance wherein many men are of them, and the slowness of assent wherewith others receive them, are manifest proofs that they are not innate, and such as offer themselves to their view without searching.

§ 2. *Faith and justice not owned as principles by all men.*—Whether there be any such moral principles, wherein all men agree, I appeal to any who have been but moderately conversant in the history of mankind, and looked abroad beyond the smoke of their own chimneys. Where is that practical truth that is universally received without doubt or question, as it must be, if innate? Justice, and keeping of contracts, is that which most men seem to agree in. This is a principle which is thought to extend itself to the dens of thieves, and the confederacies of the greatest villains; and they who have gone farthest towards the putting off of humanity itself, keep faith and rules of justice one with another. I grant that outlaws themselves do this one amongst another; but it is without receiving these as the innate laws of nature. They practise them as rules of convenience within their own communities: but it is impossible to conceive that he embraces justice as a practical principle who acts fairly with his fellow highwayman, and at the same time plunders or kills the next honest man he meets with. Justice and truth are the common ties of society; and, therefore, even outlaws and robbers, who break with all the world besides, must keep faith and rules of equity among themselves, or else they cannot hold together. But will any one say, that those that live by fraud or rapine, have innate principles of truth and justice which they allow and assent to?

§ 3. *Objection, Though men deny them in their practice, yet they admit them in their thoughts, answered.*—Perhaps it will be urged, that the tacit assent of their minds agrees to what their practice contradicts. I answer, *first*, I have always thought the actions of men the best interpreters of their thoughts. But since it is certain, that most men's practice, and some men's open professions, have either questioned or denied these principles, it is impossible to establish a universal consent (though we should look for it only amongst grown men), without which it is impossible to conclude them innate. *Secondly*, It is very strange and unreasonable to suppose innate practical principles, that terminate only

in contemplation. Practical principles derived from nature, are there for operation, and must produce conformity of action, not barely speculative assent to their truth, or else they are in vain distinguished from speculative maxims. Nature, I confess, has put into man a desire of happiness, and an aversion to misery: these, indeed, are innate practical principles, which (as practical principles ought) do continue constantly to operate and influence all our actions, without ceasing; these may be observed in all persons, and all ages, steady and universal; but these are inclinations of the appetite to good, not impressions of truth on the understanding. I deny not, that there are natural tendencies imprinted on the minds of men; and that from the very first instances of sense and perception, there are some things that are grateful, and others unwelcome to them; some things that they incline to, and others that they fly: but this makes nothing for innate characters on the mind, which are to be the principles of knowledge regulating our practice. Such natural impressions on the understanding are so far from being confirmed hereby, that this is an argument against them; since, if there were certain characters imprinted by nature on the understanding, as the principles of knowledge, we could not but perceive them constantly operate in us, and influence our knowledge, as we do those others on the will and appetite; which never cease to be the constant springs and motives of all our actions, to which we perpetually feel them strongly impelling us.

§ 4. *Moral rules need a proof, ergo, not innate.*—Another reason that makes me doubt of any innate practical principles, is, that I think there cannot any one moral rule be proposed, whereof a man may not justly demand a reason, which would be perfectly ridiculous and absurd if they were innate, or so much as self-evident; which every innate principle must needs be, and not need any proof to ascertain its truth, nor want any reason to gain it approbation. He would be thought void of common sense, who asked on the one side, or on the other side went to give reason, why “it is impossible for the same thing to be, and not to be?” It carries its own light and evidence with it, and needs no other proof; he that understands the terms, assents to it for its own sake, or else nothing will ever be able to prevail with him to do it. But should that most unshaken rule of morality, and foundation of all social virtue, “that one should do as he would be done unto,” be proposed to one who never heard it before, but yet is of capacity to understand its meaning, might he not, without any absurdity, ask a reason why? And were not he that proposed it bound to make out the truth and reasonableness of it to him? Which plainly shews it not to be innate; for if it were, it could neither want nor receive any proof; but must needs (at least as soon as heard and understood) be received and assented to, as an unquestionable truth, which a man can by no means doubt of. So that the truth of all these moral rules plainly depends upon some other antecedent to them, and from which they must be deduced; which could not be, if either they were innate, or so much as self-evident.

§ 5. *Instance in keeping compacts.*—That men should keep their compacts, is certainly a great and undeniable rule in morality; but yet, if a Christian, who has the view of happiness and misery in an-

other life, be asked why a man must keep his word? he will give this as a reason: Because God, who has the power of eternal life and death, requires it of us. But if a Hobbist be asked why, he will answer because the public requires it, and the Leviathan will punish you if you do not. And if one of the old philosophers had been asked, he would have answered because it was dishonest, below the dignity of a man, and opposite to virtue, the highest perfection of human nature, to do otherwise.

§ 6. *Virtue generally approved, not because innate, but because profitable.*—Hence naturally flows the great variety of opinions concerning moral rules, which are to be found among men, according to the different sorts of happiness they have a prospect of, or propose to themselves: which could not be if practical principles were innate, and imprinted in our minds immediately by the hand of God. I grant the existence of God is so many ways manifest, and the obedience we owe him so congruous to the light of reason, that a great part of mankind give testimony to the law of nature; but yet, I think, it must be allowed, that several moral rules may receive from mankind a very general approbation, without either knowing or admitting the true ground of morality; which can only be the will and law of a God, who sees men in the dark, has in his hand rewards and punishments, and power enough to call to account the proudest offender. For God, having, by an inseparable connexion, joined virtue and public happiness together; and made the practice thereof necessary to the preservation of society, and visibly beneficial to all with whom the virtuous man has to do, it is no wonder that every one should not only allow, but recommend and magnify those rules to others, from whose observance of them he is sure to reap advantage to himself. He may, out of interest, as well as conviction, cry up that for sacred, which, if once trampled on, and profaned, he himself cannot be safe nor secure. This, though it takes nothing from the moral and eternal obligation which these rules evidently have, yet it shews that the outward acknowledgment men pay to them in their words, proves not that they are innate principles; nay, it proves not so much as that men assent to them inwardly in their own minds, as the inviolable rules of their own practice, since we find that self-interest, and the conveniencies of this life, make many men own an outward profession and approbation of them, whose actions sufficiently prove, that they very little consider the Lawgiver that prescribed these rules, nor the hell that he has ordained for the punishment of those that transgress them.

§ 7. *Men's actions convince us that the rule of virtue is not their internal principle.*—For, if we will not in civility allow too much sincerity to the professions of most men, but think their actions to be the interpreters of their thoughts, we shall find that they have no such internal veneration for these rules, nor so full a persuasion of their certainty and obligation. The great principle of morality, “To do as one would be done to,” is more commended than practised. But the breach of this rule cannot be a greater vice, than to teach others that it is no moral rule, nor obligatory, would be thought madness, and contrary to that interest men sacrifice to, when they break it themselves,

Perhaps conscience will be urged as checking us for such breaches, and so the internal obligation and establishment of the rule be preserved.

§ 8. *Conscience no proof of any innate moral rule.*—To which I answer, that I doubt not, but without being written on their hearts, many men may, by the same way that they come to the knowledge of other things, come to assent to several moral rules, and be convinced of their obligation. Others also may come to be of the same mind, from their education, company, and customs of their country; which persuasion, however got, will serve to set conscience on work, which is nothing else but our own opinion or judgment of the moral rectitude or pravity of our own actions. And if conscience be a proof of innate principles, contraries may be innate principles; since some men, with the same bent of conscience, prosecute what others avoid.

§ 9. *Instances of enormities practised without remorse.*—But I cannot see how any men should ever transgress those moral rules, with confidence and serenity, were they innate, and stamped upon their minds. View but an army at the sacking of a town, and see what observation or sense of moral principles, or what touch of conscience for all the outrages they do. Robberies, murders, rapes, are the sports of men set at liberty from punishment and censure. Have there not been whole nations, and those of the most civilized people, amongst whom the exposing their children, and leaving them in the fields, to perish by want or wild beasts, has been the practice, as little condemned or scrupled, as the begetting them? Do they not still, in some countries, put them into the same graves with their mothers, if they die in childbirth; or despatch them, if a pretended astrologer declares them to have unhappy stars? And are there not places where, at a certain age, they kill, or expose their parents, without any remorse at all? In a part of Asia, the sick, when their case comes to be thought desperate, are carried out, and laid on the earth, before they are dead; and left there, exposed to wind and weather, to perish without assistance or pity.* It is familiar among the Mingrelians, a people professing Christianity, to bury their children alive without scruple.† There are places where they geld their children.‡ The Caribbees were wont to geld their children, on purpose to fat and eat them.§ And Garcilasso de la Vega tells us of a people in Peru, which were wont to fat and eat the children they got on their female captives, whom they kept as concubines for that purpose; and when they were past breeding, the mothers themselves were killed, too, and eaten.|| The virtues whereby the Tououpinambos believed they merited paradise, were revenge, and eating abundance of their enemies. They have not so much as the name for God,¶ and have no religion, no worship. The saints who are canonized amongst the Turks, lead lives which one cannot with modesty relate. A remarkable passage to this purpose, out of the voyage of Baumgarten, which is a book not every day to be met with, I shall set down at large, in the language it is published in. “Ibi (sc. prope Belbes in Egypto) vidimus sanctum unum Saracenicum inter arenarum

cumulos, ita ut ex utero matris prodiit, nudum sedentem. Mos est, ut didicimus, Mahometistis, ut eos, qui amentes et sine ratione sunt, pro sanctis colant et venerentur. Insuper et eos, qui cum diu vitam egerint inquinatissimam, voluntariam demum pœnitentiam et paupertatem, sanctitate venerandos deputant. Ejusmodi verò genus hominum libertatem quandam effrænem habent, domos quas volunt intrandi, edendi, bibendi, et quod majus est, concumbendi: ex quo concubitu si proles secuta fuerit, sancta similiter habetur. His ergo hominibus, dum vivunt, magnos exhibent honores; mortuis verò vel templa vel monumenta extruunt amplissima, eosque contingere ac sepelire maximæ fortunæ ducunt loco. Audivimus hæc dicta et dicenda per interpretem à Mucrelo nostro. Insuper sanctum illum, quem eo loco vidimus, publicitus apprimè commendari, eum esse hominem sanctum, divinum ac integritate præcipuum; eo quod, nec fœminarum unquam esset, nec puerorum, sed tantummodo assellarum concubitor atque muliarum." *Peregr. Baumgarten*, l. 2. c. 1. p. 73. More of the same kind, concerning these precious saints among the Turks, may be seen in Pietro della Valle, in his letter of the 25th of January, 1616. Where then are those innate principles of justice, piety, gratitude, equity, chastity? Or, where is that universal consent, that assures us there are such inbred rules? Murders in duels, when fashion has made them honourable, are committed without remorse of conscience: nay, in many places, innocence in this case is the greatest ignominy. And if we look abroad, to take a view of men as they are, we shall find that they remorse in one place, for doing or omitting that which others, in another place, think they merit by.

§ 10. *Men have contrary practical principles.*—He that will carefully peruse the history of mankind, and look abroad into the several tribes of men, and with indifference survey their actions, will be able to satisfy himself, that there is scarce that principle of morality to be named, or rule of virtue to be thought on (those only excepted, that are absolutely necessary to hold society together, which commonly, too, are neglected betwixt distinct societies) which is not, somewhere or other, slighted and condemned by the general fashion of whole societies of men governed by practical opinions, and rules of living, quite opposite to others.

§ 11. *Whole nations reject several moral rules.*—Here, perhaps, it will be objected, that it is no argument, that the rule is not known, because it is broken. I grant the objection good, where men, though they transgress, yet disown not the law; where fear of shame, censure, or punishment, carries the mark of some awe it has upon them. But it is impossible to conceive, that a whole nation of men should all publicly reject and renounce, what every one of them certainly and infallibly knew to be a law; for so they must, who have it naturally imprinted on their minds. It is possible men may sometimes own rules of morality, which, in their private thoughts they do not believe to be true, only to keep themselves in reputation, and esteem amongst those who are persuaded of their obligation. But is not to be imagined, that a whole society of men should publicly and professedly disown and cast off a rule, which they could not, in their own minds, but be infallibly

certain was a law; nor be ignorant that all men they should have to do with, knew it to be such: and, therefore, must every one of them apprehend from others all the contempt and abhorrence due to one who professes himself void of humanity; and one who, confounding the known and natural measures of right and wrong, cannot but be looked on as the professed enemy of their peace and happiness. Whatever practical principle, is innate, cannot but be known to every one to be just and good. It is, therefore, little less than a contradiction, to suppose that whole nations of men should, both in their professions and practice, unanimously and universally give the lie to what, by the most invincible evidence, every one of them knew to be true, right, and good. This is enough to satisfy us, that no practical rule, which is any where universally, and with public approbation, or allowance, transgressed, can be supposed innate. But I have something further to add, in answer to this objection.

§ 12. The breaking of a rule, say you, is no argument that it is unknown. I grant it: but the generally allowed breach of it any where, I say, is a proof that it is not innate. For example, let us take any of these rules, which being the most obvious deductions of human reason, and conformable to the natural inclination of the greatest part of men, fewest people have had the impudence to deny, or inconsideration to doubt of. If any can be thought to be naturally imprinted, none I think can have a fairer pretence to be innate than this; "parents, preserve and cherish your children." When, therefore, you say that this is an innate rule, what do you mean? either, that it is an innate principle, which, upon all occasions, excites and directs the actions of all men; or else, that it is a truth which all men have imprinted on their minds, and which therefore, they know and assent to. But in neither of these senses is it innate. *First*, That it is not a principle which influences all men's actions, is what I have proved by the examples before cited: nor need we seek so far as Mingrelia or Peru, to find instances of such as neglect, abuse, nay, and destroy their children; or look on it only as the more than brutality of some savage and barbarous nations, when we remember that it was a familiar and uncondemned practice among the Greeks and Romans, to expose, without pity or remorse, their innocent infants. *Secondly*, That it is an innate truth, known to all men, is also false. For "parents, preserve your children," is so far from an innate truth, that it is no truth at all; it being a command, and not a proposition, and so not capable of truth or falsehood. To make it capable of being assented to as true, it must be reduced to some such proposition as this: "It is the duty of parents to preserve their children." But what duty is, cannot be understood without a law; nor a law be known or supposed, without a law-maker, or without reward and punishment: so that it is impossible that this, or any other practical principle, should be innate; *i. e.* be imprinted on the mind as a duty, without supposing the ideas of God, of law, of obligation, of punishment, of a life after this, innate. For that punishment follows not, in this life, the breach of this rule; and, consequently, that it has not the force of a law in countries where the generally allowed practice runs counter to it, is in itself evident. But these ideas (which must be all of

them innate, if any thing as a duty be so) are so far from being innate, that it is not every studious or thinking man, much less every one that is born, in whom they are to be found clear and distinct; and that one of them, which, of all others, seems most likely to be innate, is not so (I mean the idea of God), I think, in the next chapter, will appear very evident to any considering man.

§ 13. From what has been said, I think we may safely conclude, that whatever practical rule is, in any place, generally, and with allowance, broken, cannot be supposed innate, it being impossible that men should, without shame or fear, confidently and serenely break a rule, which they could not but evidently know that God had set up, and would certainly punish the breach (of which they must, if it were innate), to a degree, to make it a very ill bargain to the transgressor. Without such a knowledge as this, a man can never be certain that any thing is his duty. Ignorance, or doubt of the law, hopes to escape the knowledge or power of the law-maker, or the like, may make men give way to a present appetite: but let any one see the fault, and the rod by it, and with the transgression, a fire ready to punish it; a pleasure tempting, and the hand of the Almighty visibly held up, and prepared to take vengeance (for this must be the case, where any duty is imprinted on the mind), and then tell me, whether it be possible for people, with such a prospect, such a certain knowledge as this, wantonly, and without scruple to offend against a law, which they carry about them in indelible characters, and that stares them in the face whilst they are breaking it? Whether men, at the same time that they feel in themselves the imprinted edicts of an Omnipotent Law-maker, can, with assurance and gaiety, slight and trample under foot, his most sacred injunctions? And lastly, whether it be possible, that whilst a man thus openly bids defiance to this innate law, and supreme Lawgiver, all the by-standers, yea even the governors and rulers of the people, full of the same sense, both of the law and Law-maker, should silently connive, without testifying their dislike, or laying the least blame on it? Principles of actions, indeed, there are lodged in men's appetites, but these are so far from being innate moral principles, that if they were left to their full swing, they would carry men to the overturning of all morality. Moral laws are set as a curb and restraint to these exorbitant desires, which they cannot be but by rewards and punishments, that will overbalance the satisfaction any one shall propose to himself in the breach of the law. If, therefore, any thing be imprinted on the mind of all men as a law, all men must have a certain and unavoidable knowledge, that certain and unavoidable punishment will attend the breach of it. For if men can be ignorant or doubtful of what is innate, innate principles are insisted on and urged to no purpose; truth and certainty (the things pretended) are not at all secured by them; but men are in the same uncertain, floating estate with, as without them. An evident indubitable knowledge of unavoidable punishment, great enough to make the transgression very uneligible, must accompany an innate law; unless, with an innate law, they can suppose an innate gospel too. I would not be here mistaken, as if, because I deny an innate law, I thought there were none but positive laws. There is a great deal of difference between an innate law, and a law

of nature; between something imprinted on our minds in their very original, and something that we, being ignorant of, may attain to the knowledge of, by the use and due application of our natural faculties. And, I think, they equally forsake the truth, who, running into contrary extremes, either affirm an innate law, or deny that there is a law knowable by the light of nature, *i. e.* without the help of positive revelation.

§ 14. *Those who maintain innate practical principles, tell us not what they are.*—The difference there is amongst men in their practical principles, is so evident, that, I think, I need say no more to evince that it will be impossible to find any innate moral rules, by this mark of general assent; and it is enough to make one suspect that the supposition of such innate principles is but an opinion taken up at pleasure; since those who talk so confidently of them, are so sparing to tell us which they are. This might with justice be expected from those men who lay stress upon this opinion and it gives occasion to distrust either their knowledge or charity, who, declaring that God has imprinted on the minds of men the foundations of knowledge, and the rules of living, are yet so little favourable to the information of their neighbours, or the quiet of mankind, as not to point out to them which they are, in the variety men are distracted with. But, in truth, were there any such innate principles, there would be no need to teach them. Did men find such innate propositions stamped on their minds, they would easily be able to distinguish them from other truths, that they afterward learned and deduce from them; and there would be nothing more easy than to know what, and how many, they were. There could be no more doubt about the number, than there is about the number of our fingers; and it is like then every system would be ready to give them us by tale. But since nobody, that I know, has ventured yet to give a catalogue of them, they cannot blame those who doubt of these innate principles; since even they who require men to believe that there are such innate propositions, do not tell us what they are. It is easy to foresee, that if different men of different sects should go about to give us a list of those innate practical principles, they would set down only such as suited their distinct hypotheses, and were fit to support the doctrines of their particular schools or churches: a plain evidence that there are no such innate truths. Nay, a great part of men are so far from finding any such innate moral principles in themselves, that, by denying freedom to mankind, and thereby making men no other than bare machines, they take away not only innate, but all moral rules whatsoever, and leave not a possibility to believe any such, to those who cannot conceive how any thing can be capable of a law, that is not a free agent; and upon that ground, they must necessarily reject all principles of virtue, who cannot put morality and mechanism together, which are not very easy to be reconciled, or made consistent.

§ 15. *Lord Herbert's innate principles examined.*—When I had writ this, being informed that my Lord Herbert had, in his book *De Veritate*, assigned these innate principles, I presently consulted him, hoping to find, in a man of so great parts, something that might satisfy me in this point, and put an end to my inquiry. In his chapter *De Instinctu Naturali*, p. 72, edit. 1656, I met with these six marks of his

Notitiæ Communes: “1. Prioritas. 2. Independentia. 3. Universalitas. 4. Certitudo. 5. Necessitas,” *i. e.* as he explains it, “faciunt ad hominis conservationem. 6. Modus conformationis, *i. e.* Assensus nullâ interpositâ morâ.” And at the latter end of his little treatise, *De Religioni Laici*, he says this of these innate principles: “Adeo ut non uniuscujusvis religionis confinio arcentur que ubique vigent veritates. Sunt enim in ipsâ mente cœlitus descriptæ, nullisque traditionibus, sive scriptis, sive non scriptis, obnoxia,” p. 3; and, “Veritates nostræ Catholicæ, quæ tanquam indubia Dei effata in foro interiori descriptæ.” Thus having given the marks of the innate principles, or common notions, and asserted their being imprinted on the minds of men by the hand of God, he proceeds to set them down, and they are these: “1. Esse aliquod supremum numen. 2. Numen illud coli debere. 3. Virtutem cum pietate conjunctam optimam esse rationem cultûs divini. 4. Resipiscendum esse à peccatis. 5. Dari præmium vel pœnam post hanc vitam transactam.” Though I allow these to be clear truths, and such as, if rightly explained, a rational creature can hardly avoid giving his assent to; yet I think he is far from proving them innate impressions “in foro interiori descriptæ.” For I must take leave to observe,

§ 16. *First*, That these five propositions are either not all, or more than all, those common notions writ on our minds by the finger of God, if it were reasonable to believe any at all to be so written. Since there are other propositions, which, even by his own rules, have as just a pretence to such an original, and may be as well admitted for innate principles, as, at least, some of these five he enumerates, *viz.* “Do as thou wouldst be done unto;” and, perhaps, some hundreds of others, when well considered.

§ 17. *Secondly*, That all his marks are not to be found in each of his five propositions, *viz.* his first, second, and third marks, agree perfectly to neither of them; and the first, second, third, fourth, and sixth marks, agree but ill to his third, fourth, and fifth propositions. For, besides that, we are assured from history, of many men, nay, whole nations, who doubt or disbelieve some or all of them; I cannot see how the third, *viz.* “That virtue joined with piety, is the best worship of God,” can be an innate principle, when the name, or sound, virtue, is so hard to be understood; liable to so much uncertainty in its signification; and the thing it stands for, so much contended about, and difficult to be known. And, therefore, this can be but a very uncertain rule of human practice, and serve but very little to the conduct of our lives, and is, therefore, very unfit to be assigned as an innate practical principle.

§ 18. For let us consider this proposition as to its meaning (for it is the sense, and not sound, that is, and must be, the principle or common notion), *viz.* “Virtue is the best worship of God;” *i. e.* is most acceptable to him; which, if virtue be taken, as most commonly it is, for those actions which, according to the different opinions of several countries, are accounted laudable, will be a proposition so far from being certain, that it will not be true. If virtue be taken for actions conformable to God’s will, or to the rule prescribed by God which is the

true and only measure of virtue, when virtue is used to signify what is in its nature right and good, then this proposition, "That virtue is the best worship of God," will be most true and certain, but of very little use in human life, since it will amount to no more but this, viz. "That God is pleased with the doing of what he commands;" which a man may certainly know to be true, without knowing what it is that God doth command; and so be as far from any rule or principle of his actions, as he was before; and, I think, very few will take a proposition which amounts to no more than this, viz. "That God is pleased with the doing of what he himself commands," for an innate moral principle writ on the minds of all men (however true and certain it may be), since it teaches so little. Whosoever does so, will have reason to think hundreds of propositions innate principles, since there are many, which have as good a title as this, to be received for such, which nobody yet ever put into that rank of innate principles.

§ 19. Nor is the fourth proposition (viz. "Men must repent of their sins,") much more instructive, till what those actions are, that are meant by sins, be set down. For the word peccata, or sins, being put, as it usually is, to signify, in general, ill actions, that will draw punishment upon the doers, what great principle of morality can that be, to tell us we should be sorry, and cease to do that which will bring mischief upon us, without knowing what those particular actions are, that will do so? indeed, this is a very true proposition, and fit to be inculcated on, and received by those, who are supposed to have been taught, what actions, in all kinds, are sins; but neither this, nor the former, can be imagined to be innate principles, nor to be of any use, if they were innate, unless the particular measures and bounds of all virtues and vices, were engraven in men's minds, and were innate principles also, which, I think, is very much to be doubted. And, therefore, I imagine, it will scarcely seem possible, that God should engrave principles in men's minds, in words of uncertain signification, such as virtues and sins, which, amongst different men, stand for different things; nay, it cannot be supposed to be in words at all, which, being in most of these principles very general names, cannot be understood, but by knowing the particulars comprehended under them. And, in the practical instances, the measures must be taken from the knowledge of the actions themselves, and the rules of them abstracted from words, and antecedent to the knowledge of names; which rules a man must know, what language soever he chance to learn, whether English or Japanese; or if he should learn no language at all, or never should understand the use of words, as happens in the case of dumb and deaf men. When it shall be made out, that men, ignorant of words, or untaught by the laws and customs of their country, know that it is part of the worship of God, not to kill another man; not to know more women than one; not to procure abortion; not to expose their children; not to take from another what is his, though we want it ourselves, but, on the contrary, relieve and supply his wants; and whenever we have done the contrary, we ought to repent, be sorry, and resolve to do so no more; when, I say, all men shall be proved actually to know and allow all these and a thousand other such rules, all which come under these two general words made

use of above, viz. "virtutes et peccata," virtues and sins, there will be more reason for admitting these and the like, for common notions, and practical principles; yet, after all, universal consent (were there any in moral principles) to truths, the knowledge whereof may be attained otherwise, would scarce prove them to be innate; which is all I contend for.

§ 20. *Object. Innate principles may be corrupted, answered.*—Nor will it be of much moment here, to offer that very ready, but not very material answer, (viz.) That the innate principles of morality, may, by education and custom, and the general opinion of those amongst whom we converse, be darkened, and, at last, quite worn out of the minds of men. Which assertion of theirs, if true, quite takes away the argument of universal consent, by which this opinion of innate principles is endeavoured to be proved; unless those men will think it reasonable, that their private persuasions, or that of their party, should pass for universal consent; a thing not unfrequently done, when men, presuming themselves to be the only masters of right reason, cast by the votes and opinions of the rest of mankind, as not worthy the reckoning. And then their argument stands thus: "The principles which all mankind allow for true, are innate; those that men of right reason admit, are the principles allowed by all mankind; we, and those of our mind, are men of reason; therefore, we agreeing, our principles are innate;" which is a very pretty way of arguing, and a short cut to infallibility. For otherwise it will be very hard to understand, how there be some principles, which all men do acknowledge and agree in; and yet there are none of those principles, which are not by depraved custom, and ill education, blotted out of the minds of many men; which is to say, that all men admit, but yet many men do deny, and dissent from them. And, indeed, the supposition of such first principles will serve us to very little purpose; and we shall be as much at a loss with, as without them, if they may, by any human power, such as is the will of our teachers, or opinions of our companions, be altered or lost in us; and notwithstanding all this boast of first principles, and innate light, we shall be as much in the dark and uncertainty, as if there were no such thing at all; it being all one, to have no rule, and one that will warp any way; or amongst various and contrary rules, not to know which is the right. But concerning innate principles, I desire these men to say, whether they can, or cannot, by education and custom, be blurred and blotted out; if they cannot, we must find them in all mankind alike, and they must be clear in every body; and if they may suffer variation from adventitious notions, we must then find them clearest and most perspicuous nearest the fountain, in children and illiterate people, who have received least impression from foreign opinions. Let them take which side they please, they will certainly find it inconsistent with visible matter of fact, and daily observation.

§ 21. *Contrary principles in the world.*—I easily grant that there are great numbers of opinions, which, by men of different countries, educations, and tempers, are received and embraced as first and unquestionable principles, many whereof, both for their absurdity, as well as oppositions to one another, it is impossible should be true. But yet all those

propositions, how remote soever from reason, are so sacred somewhere or other, that men, even of good understanding in other matters, will sooner part with their lives, and whatever is dearest to them, than suffer themselves to doubt, or others to question, the truth of them.

§ 22. *How men commonly come by their principles.*—This, however strange it may seem, is that which every day's experience confirms; and will not, perhaps, appear so wonderful, if we consider the ways and steps by which it is brought about; and how really it may come to pass, that doctrines, that have been derived from no better original than the superstition of a nurse, and the authority of an old woman, may, by length of time, and consent of neighbours, grow up to the dignity of principles in religion or morality. For such who are careful (as they call it) to principle children well (and few there be who have not a set of those principles for them, which they believe in), instil into the unwary, and, as yet, unprejudiced understanding (for white paper receives any characters), those doctrines they would have them retain and profess. These being taught them as soon as they have any apprehension; and still as they grow up, confirmed to them, either by the open profession, or tacit consent, of all they have to do with, or, at least, by those of whose wisdom, knowledge, and piety, they have an opinion, who never suffer those propositions to be otherwise mentioned but as the basis and foundation on which they build their religion and manners; come, by these means, to have the reputation of unquestionable, self-evident, and innate truths.

§ 23. To which we may add, that when men, so instructed, are grown up, and reflect on their own minds, they cannot find any thing more ancient there, than those opinions which were taught them before their memory began to keep a register of their actions, or date the time when any new thing appeared to them; and, therefore, make no scruple to conclude, that those propositions, of whose knowledge they can find in themselves no original, were certainly the impress of God and nature upon their minds; and not taught them by any one else. These they eutertain and submit to, as many do to their parents, with veneration; not because it is natural, nor do children do it where they are not so taught, but because, having been always so educated, and having no remembrance of the beginning of this respect, they think it is natural.

§ 24. This will appear very likely, and almost unavoidable to come to pass, if we consider the nature of mankind, and the constitution of human affairs, wherein most men cannot live without employing their time in the daily labours of their calling: nor be at quiet in their minds, without some foundation or principle to rest their thoughts on. There is scarce any one so floating and superficial in his understanding, who hath not some revered propositions, which are to him the principles on which he bottoms his reasonings, and by which he judgeth of truth and falsehood, right and wrong; which some, wanting skill and leisure, and others the inclination, and some being taught that they ought not to examine, there are few to be found who are not exposed by their ignorance, laziness, education, or precipitancy, to take them upon trust.

§ 25. This is evidently the case of all children and young folks, and custom, a greater power than nature, seldom failing to make them worship for divine, what she hath inured them to bow their minds, and submit their understandings to, it is no wonder that grown men, either perplexed in the necessary affairs of life, or hot in the pursuit of pleasures, should not seriously sit down to examine their own tenets, especially when one of their principles is, that principles ought not to be questioned. And had men leisure, parts, and will, who is there almost that dare shake the foundations of all his past thoughts and actions, and endure to bring upon himself the shame of having been a long time wholly in mistake and error? Who is there hardy enough to contend with the reproach which is every where prepared for those who dare venture to dissent from the received opinions of their country or party? And where is the man to be found that can patiently prepare himself to bear the name of whimsical, sceptical, or atheist, which he is sure to meet with, who does in the least scruple any of the common opinions? And he will be much more afraid to question those principles, when he shall think them, as most men do, the standards set up by God in his mind, to be the rule and touchstone of all other opinions. And what can hinder him from thinking them sacred, when he finds them the earliest of all his own thoughts, and the most revered by others?

§ 26. It is easy to imagine how, by these means, it comes to pass, that men worship the idols that have been set up in their minds, grow fond of the notions they have been long acquainted with there, and stamp the characters of divinity upon absurdities and errors; become zealous votaries to bulls and monkeys; and contend too, fight and die, in defence of their opinions: “Dum solos credit habendos esse deos, quos ipse colit.” For since the reasoning faculties of the soul, which are almost constantly, though not always warily nor wisely employed, would not know how to move, for want of a foundation and footing, in most men, who, through laziness or avocation, do not, or for want of time, or true helps, or for other causes, cannot penetrate into the principles of knowledge, and trace truth to its fountain and original, it is natural for them, and almost unavoidable, to take up with some borrowed principles; which being reputed and presumed to be the evident proofs of other things, are thought not to need any other proof themselves. Whoever shall receive any of these into his mind, and entertain them there with the reverence usually paid to principles, never venturing to examine them, but accustoming himself to believe them, because they are to be believed, may take up from his education, and the fashions of his country, any absurdity for innate principles; and by long poring on the same objects, so dim his sight, as to take monsters lodged in his own brain, for the images of the Deity, and the workmanship of his hands.

§ 27. *Principles must be examined.*—By this progress, how many there are who arrive at principles, which they believe innate, may be easily observed, in the variety of opposite principles held and contended for by all sorts and degrees of men. And he that shall deny this to be the method, wherein most men proceed to the assurance they have of the truth and evidence of their principles, will, perhaps, find it a

hard matter, any other way to account for the contrary tenets, which are firmly believed, confidently asserted, and with great numbers, are ready, at any time, to seal with their blood. And, indeed, if it be the privilege of innate principles to be received upon their own authority, without examination, I know not what may not be believed, or how any one's principles can be questioned. If they may, and ought to be examined and tried, I desire to know how first and innate principles can be tried; or, at least, it is reasonable to demand the marks and characters whereby the genuine innate principles may be distinguished from others; that so, amidst the great variety of pretenders, I may be kept from mistakes, in so material a point as this. When this is done, I shall be ready to embrace such welcome and useful propositions; and till then, I may with modesty doubt, since, I fear, universal consent, which is the only one produced, will scarce prove a sufficient mark to direct my choice, and assure me of any innate principles. From what has been said, I think it past doubt, that there are no practical principles wherein all men agree; and, therefore, none innate.

CHAP. IV.

OTHER CONSIDERATIONS CONCERNING INNATE PRINCIPLES, BOTH SPECULATIVE AND PRACTICAL.

§ 1. *Principles not innate, unless their ideas be innate.*—Had those, who would persuade us that there are innate principles, not taken them together in gross, but considered separately the parts out of which those propositions are made, they would not, perhaps, have been so forward to believe they were innate. Since, if the ideas which made up those truths, were not, it was impossible that the propositions made up of them should be innate, or the knowledge of them born with us. For if the ideas be not innate, there was a time when the mind was without those principles, and then they will not be innate, but be derived from some other original. For where the ideas themselves are not, there can be no knowledge, no assent, no mental or verbal propositions about them.

§ 2. *Ideas, especially those belonging to principles, not born with children.*—If we will attentively consider new-born children, we shall have little reason to think that they bring many ideas into the world with them. For bating, perhaps, some faint ideas of hunger, and thirst, and warmth, and some pains which they may have felt in the womb, there is not the least appearance of any settled ideas at all in them; especially of ideas answering the terms which make up those universal propositions that are esteemed innate principles. One may perceive, how, by degrees, afterward, ideas come into their minds; and that they get no more, nor no other, than what experience, and the observation of things that come in their way, furnish them with, which might be enough to satisfy us that they are not original characters stamped on the mind.

§ 3. “It is impossible for the same thing to be, and not to be,” is certainly (if there be any such) an innate principle. But can any one think, or will any one say, that impossibility and identity are two innate

ideas? Are they such as all mankind have, and bring into the world with them? And are they those which are the first in children, and antecedent to all acquired ones? If they are innate, they must needs be so. Hath a child an idea of impossibility and identity, before it has of white or black, sweet or bitter? And is it from the knowledge of this principle, that it concludes, that wormwood rubbed on the nipple, hath not the same taste that it used to receive from thence? Is it the actual knowledge of "*impossibile est idem esse, et non esse,*" that makes a child distinguish between its mother and a stranger? or, that makes it fond of the one, and flee the other? Or does the mind regulate itself, and its assent, by ideas that it never yet had? Or the understanding draw conclusions from principles which it never yet knew or understood? The names impossibility and identity stand for two ideas, so far from being innate, or born with us, that I think it requires great care and attention to form them right in our understanding. They are so far from being brought into the world with us, so remote from the thoughts of infancy and childhood, that I believe, upon examination, it will be found that many grown men want them.

§ 4. *Identity, an idea not innate.*—If identity (to instance in that alone) be a native impression, and consequently so clear and obvious to us, that we must needs know it even from our cradles, I would gladly be resolved by one of seven, or seventy years old, whether a man, being a creature, consisting of soul and body, be the same man when his body is changed? Whether Euphorbus and Pythagoras, having had the same soul, were the same men, though they lived several ages asunder? Nay, whether the cock too, which had the same soul, were not the same with both of them? Whereby, perhaps, it will appear, that our idea of sameness is not so settled and clear as to deserve to be thought innate in us. For if those innate ideas are not clear and distinct, so as to be universally known, and naturally agreed on, they cannot be subjects of universal and undoubted truths; but will be the unavoidable occasion of perpetual uncertainty. For, I suppose, every one's idea of identity will not be the same that Pythagoras and others of his followers have: and which then shall be true? Which innate? Or are there two different ideas of identity, both innate?

§ 5. Nor let any one think that the questions I have here proposed about the identity of man, are bare empty speculations; which if they were, would be enough to shew that there was in the understandings of men no innate idea of identity. He that shall, with a little attention, reflect on the resurrection, and consider that divine justice will bring to judgment at the last day, the very same persons to be happy or miserable in the other, who did well or ill in this life, will find it, perhaps, not easy to resolve with himself, what makes the same man, or wherein identity consists; and will not be forward to think he and every one, even children themselves, have naturally a clear idea of it.

§ 6. *Whole and part, not innate ideas.*—Let us examine that principle of mathematics, viz. "that a whole is bigger than a part." This, I take it, is reckoned amongst innate principles. I am sure it has as good a title as any to be thought so; which, yet, nobody can think it to be, when he considers the ideas it comprehends in it, "whole and

part," are perfectly relative ; but the positive ideas to which they properly and immediately belong, are extension and number, of which alone, whole and part are relations. So that if whole and part are innate ideas, extension and number must be so too, it being impossible to have an idea of a relation, without having any at all of the thing to which it belongs, and in which it is founded. Now, whether the minds of men have naturally imprinted on them the ideas of extension and number, I leave to be considered by those who are the patrons of innate principles.

§ 7. *Ideas of worship not innate.*—"That God is to be worshipped," is, without doubt, as great a truth as any can enter into the mind of man, and deserves the first place amongst all practical principles. But yet it can by no means be thought innate, unless the ideas of God and worship are innate. That the idea the term worship stands for, is not in the understanding of children, and a character stamped on the mind in its first original, I think, will be easily granted by any one that considers how few there be amongst grown men, who have a clear and distinct notion of it. And, I suppose, there cannot be any thing more ridiculous, than to say, that children have this practical principle innate, that God is to be worshipped ; and yet, that they know not what that worship of God is, which is their duty. But to pass by this :

§ 8. *Idea of God not innate.*—If any idea can be imagined innate, the idea of God may, of all others, for many reasons, be thought so ; since it is hard to conceive how there should be innate moral principles, without an innate idea of a Deity : without a notion of a law-maker, it is impossible to have a notion of a law, and an obligation to observe it. Besides the Atheists, taken notice of amongst the ancients, and left branded upon the records of history, hath not navigation discovered, in these latter ages, whole nations at the Bay of Soldania,* in Brazil,† Boranday, ‡ and in the Caribbee Islands, &c. amongst whom there was to be found no notion of a God, no religion. Nicholaus del Techo, in literis ex Paraquaria de Caaiguarum conversione, has these words : § " Reperi eam gentem nullum nomen habere, quod Deum et hominis animam significet, nulla sacra habet, nulla idola." These are instances of nations where uncultivated nature has been left to itself, without the help of letters and discipline, and the improvements of arts and sciences. But there are others to be found, who have enjoyed these in a very great measure, who yet, for want of a due application of their thoughts this way, want the idea and knowledge of God. It will, I doubt not, be a surprise to others, as it was to me, to find the Siamites of this number. But for this, let them consult the King of France's late envoy thither, || who gives no better account of the Chinese themselves. ¶ And if we will not believe La Loubere, the missionaries of China, even the Jesuits themselves, the great encomiasts of the Chinese, do all, to a man, agree, and will convince us, that the sect of the literati, or learned, keeping to the old religion of China, and the ruling party

there, are all of them Atheists. [Vid. Navarette, in the collection of voyages, vol. I. and *Historia Cultus Sinensium.*] And, perhaps, if we should, with attention, mind the lives and discourses of people not so far off, we should have too much reason to fear, that many, in more civilized countries, have no very strong and clear impressions of a Deity upon their minds: and that the complaints of Atheism, made from the pulpit, are not without reason. And though only some profligate wretches own it too barefacedly now; yet, perhaps, we should hear more than we do of it from others, did not the fear of the magistrate's sword, or their neighbour's censure, tie up people's tongues; which, were the apprehensions of punishment or shame taken away, would as openly proclaim their Atheism, as their lives do.*

* On this reasoning of the author against innate ideas, great blame hath been laid, because it seems to invalidate an argument commonly used to prove the being of a God, viz. universal consent. To which our author answers:^a "I think that the universal consent of mankind as to the being of a God, amounts to thus much, that the vastly greater majority of mankind have, in all ages of the world, actually believed a God; that the majority of the remaining part have not actually disbelieved it; and, consequently, those who have actually opposed the belief of a God, have truly been very few. So that comparing those that have actually disbelieved, with those who have actually believed a God, their number is so inconsiderable, that in respect of this incomparably greater majority of those who have owned the belief of a God, it may be said to be the universal consent of mankind.

"This is all the universal consent which truth or matter of fact will allow; and, therefore, all that can be made use of to prove a God. But if any one would extend it farther, and speak deceitfully for God; if this universality should be urged in a strict sense, not for much the majority, but for a general consent of every one, even to a man, in all ages and countries, this would make it either no argument, or a perfectly useless and unnecessary one. For if any one deny a God, such a universality of consent is destroyed; and if nobody does deny a God, what need of arguments to convince Atheists?

"I would crave leave to ask your lordship, were there ever in the world any Atheists or no? If there were not, what need is there of raising a question about the being of a God, when nobody questions it? What need of provisional arguments against a fault, from which mankind are so wholly free; and which, by a universal consent, they may be presumed to be secure from? If you say (as I doubt not but you will) that there have been Atheists in the world, then your lordship's universal consent reduces itself to only a great majority; and then make that majority as great as you will, what I have said in the place quoted by your lordship, leaves it in its full force; and I have not said one word that does in the least invalidate this argument for a God. The argument I was upon there, was to shew, that the idea of God was not innate; and to my purpose it was sufficient, if there were but a less number found in the world, who had no idea of God, than your lordship will allow there have been of professed Atheists; for whatsoever is innate, must be universal in the strictest sense. One exception is a sufficient proof against it. So that all that I said, and which was quite to another purpose, did not at all tend, nor can be made use of, to invalidate the argument for a Deity, grounded on such a universal consent, as your lordship, and all that build on it, must own; which is only a very disproportioned majority: such a universal consent, my argument there neither affirms nor requires to be less than you will be pleased to allow it. Your lordship, therefore, might, without any prejudice to those declarations of good will and favour you have for the Author of the *Essay of Human Understanding*, have spared the mentioning his quoting authors that are in print, for matters of fact to quite another purpose, 'as going about to invalidate the argument for a Deity from the universal consent of mankind,' since he leaves that universal consent as entire and as large as you yourself do, or can own, or suppose it. But here I have no reason to be sorry that your lordship has given me this occasion for the vindication of this passage of my book; if there should be any one besides your lordship, who should so far mistake it, as to think it in the least invalidates the argument for a God, from the universal consent of mankind.

"But because you question the credibility of those authors I have quoted, which you say were very ill chosen, I will crave leave to say, that he whom I relied on for his testimony concerning the Hottentots of Soldania, was no less a man than an ambassador from the King of England to the Great Mogul; of whose relation, M. Thevenot, no ill judge in the case, had so great an esteem, that he was at the pains to translate it into French, and publish it

^a In his Third Letter to the Bishop of Worcester.

§ 9. But had all mankind, every where a notion of a God (whereof yet history tells us the contrary), it would not from thence follow, that the idea of Him was innate. For though no nation were to be found without a name, and some few dark notions of Him, yet that would not prove them to be natural impressions on the mind, any more than the names of fire, or the sun, heat, or number, do prove the ideas they stand for to be innate, because the names of those things, and the ideas of them, are so universally received and known amongst mankind. Nor, on the contrary, is the want of such a name, or the absence of such a notion, out of men's minds, any argument against the being of God, any more than it would be a proof that there was no loadstone in the world, because a great part of mankind had neither a notion of any such thing, nor a name for it; or be any show of argument to prove, that there are no distinct and various species of angels, or intelligent beings above us, because we have no ideas of such distinct species, or names for them; for men being furnished with words by the common language of their own countries, can scarce avoid having some kind of ideas of those things, whose names those they converse with, have occasion frequently to mention to them. And if they carry with it the notion of excellency, greatness, or something extraordinary; if apprehension and concernment accompany it; if the fear of absolute and irresistible power set it on upon the mind, the idea is likely to sink the deeper, and spread the farther, especially if it be such an idea as is agreeable to the common light of reason, and naturally deducible from every part of our know-

in his (which is counted no injudicious) Collection of Travels. But to intercede with your lordship for a little more favourable allowance of credit to Sir Thomas Roe's relation, Coore, an inhabitant of the country, who could speak English, assured Mr. Terry,^a that they of Soldania had no God. But if he, too, have the ill luck to find no credit with you, I hope you will be a little more favourable to a divine of the church of England, now living, and admit of his testimony in confirmation of Sir Thomas Roe's. This worthy gentleman, in the relation of his voyage to Surat, printed but two years since, speaking of the same people, has these words:^b 'They are sunk even below idolatry, are destitute of both priest and temple, and saving a little show of rejoicing which is made at the full and new moon, have lost all kind of religious devotion. Nature has so richly provided for their convenience in this life, that they have drowned all sense of the God of it, and are grown quite careless of the next.'

"But to provide against the clearest evidence of Atheism in these people, you say, 'That the account given of them makes them not fit to be a standard for the sense of mankind.' This, I think, may pass for nothing, till somebody be found, that makes them to be a standard for the sense of mankind. All the use I made of them, was to shew that there were men in the world that had no innate idea of God. But to keep something like an argument going, (for what will not that do?) you go near denying those Cafers to be men. What else do these words signify? 'A people so strangely bereft of common sense, that they can hardly be reckoned among mankind, as appears by the best accounts of the Cafers of Soldania,' &c. I hope if any of them were called Peter, James, or John, it would be past scruple that they were men: however, Courwee, Wewena, and Cowsheda, and those others who had names, that had no places in your nomenclator, would hardly pass muster with your lordship.

"My lord, I should not mention this, but that what you yourself say here, may be a motive to you to consider, that what you have laid such stress on concerning the general nature of man, as a real being, and the subject of properties, amounts to nothing for the distinguishing of species; since you yourself own, that there may be individuals, wherein there is a common nature with a particular subsistence proper to each of them; whereby you are so little able to know of which of the ranks or sorts they are, into which you say God has ordered beings, and which he hath distinguished by essential properties, that you are in doubt whether they ought to be reckoned among mankind or no."

^a Terry's Voyage, p. 17. 23.

^b Mr. Ovington, p. 489.

ledge, as that of a God is. For the visible marks of extraordinary wisdom and power appear so plainly in all the works of the creation, that a rational creature, who will but seriously reflect on them, cannot miss the discovery of a Deity; and the influence that the discovery of such a being must necessarily have on the minds of all that have but once heard of it, is so great, and carries such a weight of thought and communication with it, that it seems stranger to me, that a whole nation of men should be any where found so brutish as to want the notion of a God, than that they should be without any notion of numbers or fire.

§ 10. The name of God being once mentioned in any part of the world, to express a superior, powerful, wise, invisible being, the suitability of such a notion to the principles of common reason, and the interest men will always have to mention it often, must necessarily spread it far and wide, and continue it down to all generations; though yet the general reception of this name, and some imperfect and unsteady notions conveyed thereby to the unthinking part of mankind, prove not the idea to be innate; but only that they who made the discovery, had made a right use of their reason, thought maturely of the causes of things, and traced them to their original; from whom, other less considering people having once received so important a notion, it could not easily be lost again.

§ 11. This is all could be inferred from the notion of a God, were it to be found universally in all the tribes of mankind, and generally acknowledged by men grown to maturity in all countries. For the generality of the acknowledging of a God, as I imagine, is extended no farther than that; which, if it be sufficient to prove the idea of God innate, will as well prove the idea of fire innate: since, I think, it may be truly said, that there is not a person in the world who has a notion of a God, who has not also the idea of fire. I doubt not, but if a colony of young children should be placed in an island where no fire was, they would certainly have neither any notion of such a thing, nor name for it, how generally soever it were received and known in all the world besides; and, perhaps, too, their apprehensions would be as far removed from any name, or notion of a God, until some one amongst them had employed his thoughts, to inquire into the constitution and causes of things, which would easily lead him to the notion of a God; which having once taught to others, reason, and the natural propensity of their own thoughts, would afterward propagate and continue amongst them.

§ 12. *Suitable to God's goodness, that all men should have an idea of him, therefore naturally imprinted by him, answered.*—Indeed it is urged, that it is suitable to the goodness of God, to imprint upon the minds of men, characters and notions of himself, and not to leave them in the dark, and doubt, in so grand a concernment; and also by that means, to secure to himself the homage and veneration due from so intelligent a creature as man; and, therefore, he has done it.

This argument, if it be of any force, will prove much more than those, who use it in this case, expect from it. For if we may conclude, that God hath done for men all that men shall judge is best for them, because it is suitable to his goodness so to do, it will prove not only that

God has imprinted on the minds of men an idea of himself, but that he hath plainly stamped there, in fair characters, all that men ought to know or believe of him, all that they ought to do in obedience to his will; and that he hath given them a will and affections conformable to it. This, no doubt, every one will think better for men, than that they should, in the dark, grope after knowledge, as St. Paul tells us all nations did after God, Acts xvii. 27, than that their wills should clash with their understandings, and their appetites cross their duty. The Romanists say, it is best for men, and so suitable to the goodness of God, that there should be an infallible judge of controversies on earth; and, therefore, there is one; and I, by the same reason say, it is better for men, that every man himself should be infallible. I leave them to consider, whether, by the force of this argument, they shall think that every man is so. I think it a very good argument, to say, the infinitely wise God hath made it so; and, therefore, it is best. But it seems to me a little too much confidence of our own wisdom to say, "I think it best, and, therefore, God hath made it so;" and in the matter in hand, it will be in vain to argue from such a topic, that God hath done so, when certain experience shews us that he hath not. But the goodness of God hath not been wanting to men, without such original impressions of knowledge, or ideas, stamped on the mind; since he hath furnished men with those faculties which will serve for the sufficient discovery of all things requisite to the end of such a being; and I doubt not but to shew, that a man, by the right use of his natural abilities, may, without any innate principles, attain a knowledge of a God and other things that concern him. God having endued man with those faculties of knowing which he hath, was no more obliged, by his goodness, to plant those innate motions in his mind, than that, having given him reason, hands, and materials, he should build him bridges, or houses, which some people in the world, however of good parts, do either totally want, or are but ill provided of, as well as others are wholly without ideas of God, and principles of morality; or at least, have but very ill ones. The reason in both cases being, that they never employed their parts, faculties, and powers industriously that way, but contented themselves with the opinions, fashions, and things of their country, as they found them, without looking any farther. Had you or I been born at the Bay of Soldania, possibly our thoughts and notions had not exceeded those brutish ones of the Hottentots that inhabit there: and had the Virginia King Apochancana, been educated in England, he had been, perhaps, as knowing a divine, and as good a mathematician, as any in it. The difference between him, and a more improved Englishman, lying barely in this, that the exercise of his faculties was bounded within the ways, modes, and notions of his own country, and never directed to any other, or farther inquiries: and if he had not any idea of a God, it was only because he pursued not those thoughts that would have led him to it.

§ 13. *Ideas of God various in different men.*—I grant, that if there were any idea to be found imprinted on the minds of men, we have reason to expect it should be the notion of his Maker, as a mark God set on his own workmanship, to mind man of his dependence and duty; and that herein should appear the first instances of human knowledge.

But how late is it before any such notion is discoverable in children? and when we find it there, how much more does it resemble the opinion and notion of the teacher, than represent the true God? he that shall observe in children the progress whereby their minds attain the knowledge they have, will think that the objects they do first and most familiarly converse with, are those that make the first impressions on their understandings; nor will he find the least footsteps of any other. It is easy to take notice how their thoughts enlarge themselves, only as they come to be acquainted with a greater variety of sensible objects, to retain the ideas of them in their memories; and to get the skill to compound and enlarge them, and several ways put them together. How by these means they come to frame in their minds an idea men have of a Deity, I shall hereafter shew.

§ 14. Can it be thought that the ideas men have of God, are the characters and marks of Himself, engraven on their minds by His own finger, when we see, that in the same country, under one and the same name, men have far different, nay, often contrary and inconsistent ideas, and conceptions of Him? their agreeing in a name, or sound, will scarce prove an innate notion of Him.

§ 15. What true or tolerable notion of a Deity could they have, who acknowledged and worshipped hundreds? every Deity that they owned above one, was an infallible evidence of their ignorance of him, and a proof that they had no true notion of God, where unity, infinity, and eternity, were excluded. To which, if we add their gross conceptions of corporeity, expressed in their images, and representations of their deities; the amours, marriages, copulations, lusts, quarrels, and other mean qualities attributed by them to their gods; we shall have little reason to think that the heathen world, *i. e.* the greatest part of mankind, had such ideas of God in their minds, as He himself, out of care that they should not be mistaken about Him, was author of; and this universality of consent, so much argued, if it prove any native impressions, it will be only this, that God imprinted on the minds of all men, speaking the same language, a name for Himself, but not any idea: since those people, who agreed in the name, at the same time, had far different apprehensions about the thing signified. If they say, that the variety of deities worshipped by the heathen world, were but figurative ways of expressing the several attributes of that incomprehensible Being, or several parts of his providence; I answer, what they might be in their original, I will not here inquire; but that they were so in the thoughts of the vulgar, I think nobody will affirm: and he that will consult the voyage of the Bishop of Beryte, c. 13 (not to mention other testimonies), will find, that the theology of the Siamites professedly owns a plurality of gods; or as the Abbé de Choisy more judiciously remarks, in his *Journal du Voyage de Siam*, 1707, it consists properly in acknowledging no God at all.

If it be said, that wise men of all nations came to have true conceptions of the unity and infinity of the Deity, I grant it. But then this,

First, Excludes universality of consent in any thing but the name; for those wise men being vrey few, perhaps one of a thousand, this universality is very narrow.

Secondly, It seems to me plainly to prove, that the truest and best notions men had of God, were not imprinted, but acquired by thought and meditation, and a right use of their faculties; since the wise and considerate men of the world, by a right and careful employment of their thoughts and reason, attained true notions in this as well as other things; whilst the lazy and inconsiderate part of men, making far the greater number, took up their notions, by chance, from common tradition, and vulgar conceptions, without much beating their heads about them. And if it be a reason to think the notion of God innate, because all wise men had it, virtue, too, must be innate, for that also wise men have always had.

§ 16. This was evidently the case of all Gentilism; nor hath even amongst Jews, Christians, and Mahometans, who acknowledge but one God, this doctrine, and the care taken in those nations to teach men to have true notions of a God, prevailed so far, as to make men to have the same and the true ideas of Him. How many, even amongst us, will be found, upon inquiry, to fancy him in the shape of a man sitting in Heaven; and to have many other absurd and unfit conceptions of him? Christians, as well as Turks, have had whole sects owning and contending earnestly for it, and that the Deity was corporeal, and of human shape: and though we find few among us, who profess themselves Anthropomorphites (though some I have met with, that own it), yet, I believe, he that will make it his business, may find amongst the ignorant and uninstructed Christians, many of that opinion. Talk but with country-people, of almost any age; or young people, of almost any condition, and you shall find, that though the name of God be frequently in their mouths, yet the notions they apply this name to, are so odd, low, and pitiful, that nobody can imagine they were taught by a rational man; much less, that they were characters written by the finger of God himself. Nor do I see how it derogates more from the goodness of God, that he has given us minds unfurnished with these ideas of himself, than that he hath sent us into the world with bodies unclodded; and that there is no art or skill born with us. For being fitted with faculties to attain these, it is want of industry and consideration in us, and not of bounty in Him, if we have them not. It is as certain that there is a God, as that the opposite angles, made by the intersection of two straight lines, are equal. There was never any rational creature that set himself sincerely to examine the truth of these propositions, that could fail to assent to them; though yet it be past doubt, that there are many men, who having not applied their thoughts that way, are ignorant both of the one and the other. If any one think fit to call this (which is the utmost of its extent) universal consent, such a one I easily allow: but such a universal consent as this, proves not the idea of God, any more than it does the idea of such angles, innate.

§ 17. *If the idea of God be not innate, no other can be supposed innate.*—Since, then, though the knowledge of a God be the most natural discovery of human reason, yet the idea of Him is not innate, as, I think, is evident from what has been said; I imagine there will scarcely be another idea found, that can pretend to it: since, if God

hath set any impression, any character, on the understanding of man, it is most reasonable to expect it should have been some clear and uniform idea of Himself, as far as our weak capacities were capable to receive so incomprehensible and infinite an object. But our minds being, at first, void of that idea, which we are most concerned to have, it is a strong presumption against all other innate characters. I must own, as far as I can observe, I can find none, and would be glad to be informed by any other.

§ 18. *Idea of substance not innate.*—I confess, there is another idea which would be of general use for mankind to have, as it is of general talk, as if they had it; and that is the idea of substance, which we neither have, nor can have, by sensation or reflection. If nature took care to provide us any ideas, we might well expect they should be such, as by our own faculties, we cannot procure to ourselves: but we see, on the contrary, that since by those ways whereby our ideas are brought into our minds, this is not, we have no such clear idea at all, and, therefore, signify nothing by the word substance, but only an uncertain supposition of we know not what, *i. e.* of something whereof we have no particular distinct positive idea, which we take to be the substratum, or support of those ideas we know.

§ 19. *No propositions can be innate, since no ideas are innate.*—Whatever then we talk of innate, either speculative or practical, principles, it may, with as much probability, be said, that a man hath 100*l.* sterling in his pocket, and yet denied that he hath either penny, shilling, crown, or any other coin, out of which the sum is to be made up; as to think, that certain propositions are innate, when the ideas about which they are, can by no means be supposed to be so. The general reception and assent that is given, doth not at all prove that the ideas expressed in them are innate: for in many cases, however the ideas came there, the assent to words expressing the agreement or disagreement of such ideas, will necessarily follow. Every one that hath a true idea of God, and worship, will assent to this proposition, “that God is to be worshipped,” when expressed in a language he understands; and every rational man, that hath not thought on it to-day, may be ready to assent to this proposition to-morrow; and yet millions of men may be well supposed to want one, or both those ideas to-day. For if we will allow savages, and most country people, to have ideas of God and worship (which conversation with them will not make one forward to believe), yet, I think, few children can be supposed to have those ideas, which, therefore, they must begin to have some time or other; and then, they will begin to assent to that proposition, and make very little question of it ever after. But such an assent upon hearing, no more proves the ideas to be innate, than it does, that one born blind (with cataracts which will be couched to-morrow) had the innate ideas of the sun, or light, or saffron, or yellow; because, when his sight is cleared, he will certainly assent to this proposition, “that the sun is lucid, or that saffron is yellow:” and, therefore, if such an assent upon hearing cannot prove the ideas innate, it can much less the propositions made up of those ideas. If they have any innate ideas, I would be glad to be told what, and how many, they are.

§ 20. *No innate ideas in the memory.*—To which let me add: if there be any innate ideas, any ideas in the mind, which the mind does not actually think on; they must be lodged in the memory, and from thence must be brought into view by remembrance; *i. e.* must be known, when they are remembered, to have been perceptions in the mind before, unless remembrance can be without remembrance. For to remember, is to perceive any thing with memory, or with a consciousness that it was known or perceived before; without this whatever idea comes into the mind, is new, and not remembered: this consciousness of its having been in the mind before, being that which distinguishes remembering from all other ways of thinking. Whatever idea was never perceived by the mind, was never in the mind. Whatever idea is in the mind, is either an actual perception, or else having been an actual perception, is so in the mind, that by the memory, it can be made an actual perception again. Whenever there is the actual perception of an idea without memory, the idea appears perfectly new and unknown before to the understanding. Whenever the memory brings any idea into actual view, it is with a consciousness that it had been there before, and was not wholly a stranger to the mind. Whether this be not so, I appeal to every one's observation: and then I desire an instance of an idea, pretended to be innate, which (before any impression of it, by ways hereafter to be mentioned) any one could revive and remember as an idea he had formerly known; without which consciousness of a former perception, there is no remembrance; and whatever idea comes into the mind without that consciousness, is not remembered, or comes not out of the memory, nor can be said to be in the mind before that appearance. For what is not either actually in view, or in the memory, is in the mind no way at all, and is all one as if it had never been there. Suppose a child had the use of his eyes, till he knows and distinguishes colours; but then cataracts shut the windows, and he is forty or fifty years perfectly in the dark; and in that time perfectly loses all memory of the ideas of colours he once had. This was the case of a blind man I once talked with, who lost his sight by the small-pox, when he was a child, and had no more notion of colours, than one born blind. I ask, whether any one can say this man had then any ideas of colours in his mind, any more than one born blind? and, I think, nobody will say, that either of them had in his mind any idea of colours at all. His cataracts are couched, and then he has the ideas (which he remembers not) of colours, *de novo*, by his restored sight, conveyed to his mind, and that without any consciousness of a former acquaintance. And these now he can revive, and call to mind in the dark. In this case, all these ideas of colours, which, when out of view, can be revived with a consciousness of a former acquaintance, being thus in the memory, are said to be in the mind. The use I make of this is, that whatever idea being not actually in view, is in the mind, is there only by being in the memory; and if it be not in the memory, it is not in the mind; and if it be in the memory, it cannot by the memory be brought into actual view, without a perception that it comes out of the memory, which is this, that it had been known before, and is now remembered. If, therefore,

there be any innate ideas, they must be in the memory, or else no where in the mind; and if they be in the memory, they can be revived without any impression from without, and whenever they are brought into the mind, they are remembered, *i. e.* they bring with them a perception of their not being wholly new to it. This being a constant and distinguishing difference between what is, and what is not, in the memory, or in the mind; that what is not in the memory, whenever it appears there, appears perfectly new, and unknown before: and what is in the memory, or in the mind, whenever it is suggested by the memory, appears not to be new, but the mind finds it in itself, and knows it was there before. By this it may be tried, whether there be any innate ideas in the mind, before impression from sensation or reflection. I would fain meet with the man, who, when he came to the use of reason, or at any other time, remembered any one of them: and to whom, after he was born, they were never new. If any one will say, there are ideas in the mind, that are not in the memory, I desire him to explain himself, and make what he says intelligible.

§ 21. *Principles not innate, because of little use, or little certainty.*—Besides what I have already said, there is another reason why I doubt that neither these, nor any other principles, are innate. I that am fully persuaded, that the infinitely wise God made all things in perfect wisdom, cannot satisfy myself, why he should be supposed to print upon the minds of men some universal principles; whereof those that are pretended innate, and concern speculation, are of no great use; and those that concern practice, not self-evident; and neither of them distinguishable from some other truths, not allowed to be innate. For to what purpose should characters be graven on the mind, by the finger of God, which are not clearer there than those which are afterward introduced, or cannot be distinguished from them? If any one thinks there are such innate ideas and propositions, which, by their clearness and usefulness, are distinguishable from all that is adventitious in the mind, and acquired, it will not be a hard matter for him to tell us which they are; and then every one will be a fit judge whether they be so or no. Since, if there be such innate ideas and impressions, plainly different from all other perceptions and knowledge, every one will find it true in himself. Of the evidence of these supposed innate maxims, I have spoken already; of their usefulness, I shall have occasion to speak more hereafter.

§ 22. *Difference of men's discoveries depends upon the different application of their faculties.*—To conclude: some ideas forwardly offer themselves to all men's understandings; some sorts of truth result from any ideas, as soon as the mind puts them into propositions: other truths require a train of ideas placed in order, a due comparing of them, and deductions made with attention, before they can be discovered and assented to. Some of the first sort, because of their general and easy reception, have been mistaken for innate; but the truth is, ideas and notions are no more born with us than arts and sciences, though, some of them, indeed, offer themselves to our faculties more readily than others; and, therefore, are more generally received; though that, too, be according as the organs of our bodies, and powers

of our minds, happen to be employed ; God having fitted men with faculties and means to discover, receive, and retain truths, according as they are employed. The great difference that is to be found in the notions of mankind, is from the different use they put their faculties to ; whilst some (and those the most) taking things upon trust, misemploy their power of assent, by lazily enslaving their minds to the dictates and dominion of others, in doctrines which it is their duty carefully to examine ; and not blindly, with an implicit faith, to swallow : others, employing their thoughts only about some few things, grow acquainted sufficiently with them, attain great degrees of knowledge in them, and are ignorant of all other, having never let their thoughts loose in the search of other inquiries. Thus, “ that the three angles of a triangle are equal to two right ones,” is a truth as certain as any thing can be ; and I think more evident than many of those propositions that go for principles ; and yet there are millions, however expert in other things, who know not this at all, because they never set their thoughts on work about such angles ; and he that certainly knows this proposition, may yet be utterly ignorant of the truth of other propositions in mathematics itself, which are as clear and evident as this ; because in his search of those mathematical truths, he stopped his thoughts short, and went not so far. The same may happen concerning the notions we have of the being of a Deity ; for though there be no truth which a man may more evidently make out to himself, than the existence of a God, yet he that shall content himself with things as he finds them in this world, as they minister to his pleasures and passions, and not make inquiry a little farther into the causes, ends, and admirable contrivances, and pursue the thoughts thereof with diligence and attention, may live long without any notion of such a being. And if any person hath, by talk, put such a notion into his head, he may, perhaps, believe it ; but if he hath never examined it, his knowledge of it will be no perfecter than his, who having been told, that the three angles of a triangle are equal to two right ones, takes it upon trust, without examining the demonstration ; and may yield his assent as a probable opinion, but hath no knowledge of the truth of it ; which yet his faculties, if carefully employed, were able to make clear and evident to him. But this only by the by, to shew how much our knowledge depends upon the right use of those powers nature hath bestowed upon us, and how little upon such innate principles, as are in vain supposed to be in all mankind for their direction ; which all men could not but know, if they were there, or else they would be there to no purpose ; and which, since all men do not know, nor can distinguish from other adventitious truths, we may well conclude there are no such.

§ 23. *Men must think and know for themselves.*—What censure, doubting thus of innate principles, may deserve from men, who will be apt to call it pulling up the old foundations of knowledge and certainty, I cannot tell ; I persuade myself, at least, that the way I have pursued, being conformable to truth, lays those foundations surer. This, I am certain, I have not made it my business either to quit or follow any authority in the ensuing discourse ; truth has been my only aim ; and wherever that has appeared to lead, my thoughts have impartially fol-

lowed, without minding whether the footsteps of any other lay that way or no. Not that I want a due respect to other men's opinions; but, after all, the greatest reverence is due to truth; and I hope it will not be thought arrogance to say, that, perhaps, we should make greater progress in the discovery of rational and contemplative knowledge, if we sought it in the fountain, in the consideration of things themselves; and made use rather of our own thoughts, than other men's, to find it. For, I think, we may as rationally hope to see with other men's eyes, as to know by other men's understandings. So much as we ourselves consider and comprehend of truth and reason, so much we possess of real and true knowledge. The floating of other men's opinions in our brains, makes us not one jot the more knowing, though they happen to be true. What in them was science, is in us but opiniatrety; whilst we give up our assent only to reverend names, and do not, as they did, employ our own reason to understand those truths which gave them reputation. Aristotle was certainly a knowing man, but nobody ever thought him so, because he blindly embraced, and confidently vented, the opinions of another. And if the taking up of another's principles, without examining them, made not him a philosopher, I suppose it will hardly make any body else so. In the sciences, every one has so much as he really knows and comprehends; what he believes only, and takes upon trust, are but shreds; which, however well in the whole piece, makes no considerable addition to his stock who gathers them. Such borrowed wealth, like fairy money, though it were gold in the hand from which he received it, will be but leaves and dust when it comes to use.

§ 24. *Whence the opinion of innate principles.*—When men have found some general propositions that could not be doubted of as soon as understood, it was, I know, a short and easy way to conclude them innate. This being once received, it eased the lazy from the pains of search, and stopped the inquiry of the doubtful, concerning all that was once stiled innate; and it was of no small advantage to those who affected to be masters and teachers, to make this the principle of principles, “that principles must not be questioned;” for having once established this tenet, that there are innate principles, it put their followers upon a necessity of receiving some doctrines as such; which was to take them off from the use of their own reason and judgment, and put them upon believing and taking them upon trust, without farther examination: in which posture of blind credulity, they might be more easily governed by, and made useful to, some sort of men, who had the skill and office to principle and guide them. Nor is it a small power he gives one man over another, to have the authority to be the dictator of principles, and teacher of unquestionable truths; and to make a man swallow that for an innate principle, which may serve to his purpose who teacheth them. Whereas, had they examined the ways whereby men came by the knowledge of many universal truths, they would have found them to result in the minds of men, from the being of things themselves, when duly considered; and that they were discovered by the application of those faculties that were fitted by nature to receive and judge of them, when duly employed about them.

§ 25. *Conclusion.*—To shew how the understanding proceeds herein, is the design of the following discourse; which I shall proceed to when I have first premised, that hitherto, to clear my way to those foundations, which I conceive are the only true ones whereon to establish those notions we can have of our own knowledge, it hath been necessary for me to give an account of the reasons I had to doubt of innate principles: and since the arguments which are against them, do some of them rise from common received opinions, I have been forced to take several things for granted, which is hardly avoidable to any one, whose task is to shew the falsehood or improbability of any tenet; it happening in controversial discourses, as it does it assaulting of towns, where if the ground be but firm whereon the batteries are erected, there is no farther inquiry of whom it is borrowed, nor whom it belongs to, so it affords but a fit rise for the present purpose. But in the future part of this discourse, designing to raise an edifice uniform and consistent with itself, as far as my own experience and observations will assist me, I hope to erect it on such a basis, that I shall not need to shore it up with props and buttresses, learning on borrowed or begged foundations; or at least, if mine prove a castle in the air, I will endeavour it shall be all of a piece, and hang together. Wherein I warn the reader not to expect undeniable cogent demonstrations, unless I may be allowed the privilege, not seldom assumed by others, to take my principles for granted; and then, I doubt not, but I can demonstrate too. All that I shall say for the principles I proceed on, is, that I can only appeal to men's own unprejudiced experience and observation, whether they be true or no; and this is enough for a man who professes no more than to lay down candidly and freely his own conjectures concerning a subject lying somewhat in the dark, without any other design than an unbiassed inquiry after truth.

BOOK II.—CHAPTER I.

OF IDEAS IN GENERAL, AND THEIR ORIGINAL.

§ 1. *IDEA is the object of thinking.*—EVERY man being conscious to himself that he thinks, and that which his mind is applied about whilst thinking, being the ideas that are there, it is past doubt, that men have in their mind several ideas, such as are those expressed by the words, whiteness, hardness, sweetness, thinking, motion, man, elephant, army, drunkenness, and others: it is in the first place then to be inquired, how he comes by them? I know it is a received doctrine, that men have native ideas, and original characters, stamped upon their minds in their very first being. This opinion I have at large examined already; and, I suppose, what I have said in the foregoing book, will be much more easily admitted, when I have shewn whence the understanding may get all the ideas it has, and by what ways and degrees they may come into the mind, for which I shall appeal to every one's own observation and experience.

§ 2. *All ideas come from sensation or reflection.*—Let us then suppose the mind to be, as we say, white paper, void of all characters, without any ideas; how comes it to be furnished? Whence comes it by that vast store which the busy and boundless fancy of man has painted on it, with an almost endless variety? Whence has it all the materials of reason and knowledge? To this I answer in one word, from experience; in that all our knowledge is founded; and from that it ultimately derives itself. Our observation employed either about external sensible objects, or about the internal operations of our minds, perceived and reflected on by ourselves, is that which supplies our understandings with all the materials of thinking. These two are the fountains of knowledge, from whence all the ideas we have, or can naturally have, do spring.

§ 3. *The objects of sensation one source of ideas.*—First, Our senses, conversant about particular sensible objects, do convey into the mind several distinct perceptions of things according to those various ways wherein those objects do affect them: and thus we come by those ideas we have, of yellow, white, heat, cold, soft, hard, bitter, sweet, and all those which we call sensible qualities, which, when I say, the senses convey into the mind, I mean, they, from external objects, convey into the mind what produces there those perceptions. This great source of most of the ideas we have, depending wholly upon our senses, and derived by them to the understanding, I call SENSATION.

§ 4. *The operations of our minds the other source of them.*—Secondly, The other fountain, from which experience furnisheth the understanding with ideas, is the perception of the operations of our own mind within us, as it is employed about the ideas it has got; which operations, when the soul comes to reflect on, and consider, do furnish the understanding with another set of ideas, which could not be had from things without; and such are, perception, thin king, doubting, believing reasoning, knowing, willing, and all the different actings of our own minds; which we being conscious of, and observing in ourselves, do from these receive into our understandings as distinct ideas, as we do from bodies affecting our senses. This source of ideas, every man has wholly in himself: and though it be not sense, as having nothing to do with external objects, yet it is very like it, and might properly enough be called internal sense. But as I call the other sensation, so I call this REFLECTION, the ideas it affords being such only, as the mind gets by reflecting on its own operations, within itself. By reflection, then, in the following part of this discourse, I would be understood to mean that notice which the mind takes of its own operations, and the manner of them, by reason whereof, there come to be ideas of these operations in the understanding. These two, I say, viz. external material things, as the objects of sensation, and the operations of our minds within, as the objects of reflection, are to me the only originals from whence all our ideas take their beginnings. The term operations here I use in a large sense, as comprehending not barely the actions of the mind about its ideas, but some sort of passions arising sometimes from them, such as is the satisfaction or uneasiness arising from any thought.

§ 5. *All our ideas are of the one or the other of these.*—The under-

standing seems to me not to have the least glimmering of any ideas which it doth not receive from one of these two. External objects furnish the mind with the ideas of sensible qualities, which are all those different perceptions they produce in us : and the mind furnishes the understanding with ideas of its own operations.

These, when we have taken a full survey of them and their several modes, combinations, and relations, we shall find to contain all our whole stock of ideas : and that we have nothing in our minds which did not come in one of these two ways. Let any one examine his own thoughts, and thoroughly search into his understanding, and then let him tell me, whether all the original ideas he has there, are any other than of the objects of his senses, or of the operations of his mind, considered as objects of his reflection ; and how great a mass of knowledge soever he imagines to be lodged there, he will, upon taking a strict view, see that he has not any idea in his mind, but what one of these two have imprinted ; though, perhaps, with infinite variety compounded and enlarged by the understanding, as we shall see hereafter.

§ 6. *Observable in children.*—He that attentively considers the state of a child at his first coming into the world, will have little reason to think him stored with plenty of ideas, that are to be the matter of his future knowledge. It is by degrees he comes to be furnished with them : and though the ideas of obvious and familiar qualities imprint themselves before the memory begins to keep a register of time or order, yet it is often so late before some unusual qualities come in the way, that there are few men that cannot recollect the beginning of their acquaintance with them ; and if it were worth while, no doubt a child might be so ordered, as to have but a very few, even of the ordinary ideas, till he were grown up to a man. But all that are born into the world, being surrounded with bodies that perpetually and diversely affect them ; variety of ideas, whether care be taken of it or no, are imprinted on the minds of children. Light and colours are busy at hand every where, when the eye is but open ; sounds, and some tangible qualities, fail not to solicit their proper senses, and force an entrance to the mind ; but yet, I think, it will be granted easily, that if a child were kept in a place where he never saw any other but black and white, till he were a man, he would have no more ideas of scarlet and green, than he that from his childhood never tasted an oyster, or a pineapple, has of those particular relishes.

§ 7. *Men are differently furnished with these, according to the different objects they converse with.*—Men then come to be furnished with fewer or more simple ideas from without, according as the objects they converse with afford greater or less variety ; and from the operations of their minds within, according as they more or less reflect on them. For though he that contemplates the operations of his mind, cannot but have plain and clear ideas of them ; yet, unless he turns his thoughts that way, and considers them attentively, he will no more have clear and distinct ideas of all the operations of his mind, and all that may be observed therein, than he will have all the particular ideas of any landscape, or of the parts and motions of a clock, who will not turn his eyes to it, and with attention heed all the parts of it. The picture,

or clock, may be so placed, that they may come in his way every day ; but yet he will have but a confused idea of all the parts they are made up of, till he applies himself with attention, to consider them each in particular.

§ 8. *Ideas of reflection later, because they need attention.*—And hence we see the reason, why it is pretty late before most children get ideas of the operations of their own minds ; and some have not any very clear or perfect ideas of the greatest part of them all their lives. Because, though they pass there continually, yet, like floating visions, they make not deep impressions enough to leave in the mind clear, distinct, lasting ideas, till the understanding turns inward upon itself, reflects on its own operations, and makes them the objects of its own contemplation. Children, when they come first into it, are surrounded with a world of new things, which, by a constant solicitation of their senses, draw the mind constantly to them, forward to take notice of new, and apt to be delighted with the variety of changing objects. Thus the first years are usually employed and diverted in looking abroad. Men's business in them is to acquaint themselves with what is to be found without ; and so growing up in a constant attention to outward sensation, seldom make any considerable reflection on what passes within them, till they come to be of riper years ; and some scarce ever at all.

§ 9. *The soul begins to have ideas, when it begins to perceive.*—To ask at what time a man has first any ideas? is to ask when he begins to perceive? having ideas, and perception, being the same thing. I know it is an opinion that the soul always thinks, and that it has the actual perception of ideas in itself constantly, as long as it exists ; and that actual thinking is as inseparable from the soul, as actual extension is from the body ; which, if true, to inquire after the beginning of a man's ideas, is the same, as to inquire after the beginning of his soul. For, by this account, soul and its ideas, as body and its extension, will begin to exist both at the same time.

§ 10. *The soul thinks not always; for this wants proofs.*—But whether the soul be supposed to exist antecedent to, or coeval with, or some time after, the first rudiments of organization, or the beginnings of life in the body, I leave to be disputed by those who have better thought of that matter. I confess myself to have one of those dull souls, that doth not perceive itself always to contemplate ideas, nor can conceive it any more necessary for the soul always to think, than for the body always to move ; the perception of ideas being (as I conceive) to the soul, what motion is to the body, not its essence, but one of its operations ; and, therefore, though thinking be supposed ever so much the proper action of the soul, yet it is not necessary to suppose, that it should be always thinking, always in action. That, perhaps, is the privilege of the infinite Author and Preserver of things, who never slumbers nor sleeps ; but is not competent to any finite being, at least not to the soul of man. We know certainly, by experience, that we sometimes think and thence draw this infallible consequence, that there is something in us that has a power to think ; but whether that substance perpetually thinks or no, we can be no farther assured, than experience

informs us. For to say, that actual thinking is essential to the soul, and inseparable from it, is to beg what is in question, and not to prove it by reason; which is necessary to be done, if it be not a self-evident proposition. But whether this, "that the soul always thinks," be a self-evident proposition, that every body assents to at first hearing, I appeal to mankind. It is doubted whether I thought at all last night, or no; the question being about a matter of fact, it is begging it to bring, as a proof for it, an hypothesis, which is the very thing in dispute; by which way one may prove any thing, and it is but supposing that all watches, whilst the balance beats, think, and it is sufficiently proved, and past doubt, that my watch thought all last night. But he that would not deceive himself, ought to build his hypothesis on matter of fact, and make it out by sensible experience, and not presume on matter of fact, because of his hypothesis, that is, because he supposes it to be so; which way of proving amounts to this, that I must necessarily think all last night, because another supposes I always think, though I myself cannot perceive that I always do so.

But men in love with their opinions, may not only suppose what is in question, but allege wrong matter of fact. How else could any one make it an inference of mine, "that a thing is not, because we are not sensible of it in our sleep?" I did not say there is no soul in a man, because he is not sensible of it in his sleep; but I do say, he cannot think at any time, waking or sleeping, without being sensible of it. Our being sensible of it, is not necessary to any thing, but to our thoughts; and to them it is, and to them it will always be necessary, till we can think without being conscious of it.

§ 11. *It is not always conscious of it.*—I grant that the soul in a waking man is never without thought, because it is the condition of being awake: but whether sleeping, without dreaming, be not an affection of the whole man, mind as well as body, may be worth a waking man's consideration; it being hard to conceive that any thing should think, and not be conscious of it. If the soul doth think in a sleeping man, without being conscious of it, I ask, whether, during such thinking, it has any pleasure or pain, or be capable of happiness or misery? I am sure the man is not, any more than the bed or earth he lies on. For to be happy or miserable, without being conscious of it, seems to me utterly inconsistent and impossible; or if it be possible that the soul can, whilst the body is sleeping, have its thinking, enjoyments, and concerns, its pleasure or pain apart, which the man is not conscious of, nor partakes in. It is certain that Socrates asleep, and Socrates awake, is not the same person: but his soul when he sleeps, and Socrates the man, consisting of body and soul when he is waking, are two persons; since waking Socrates has no knowledge of, or concernment for that happiness or misery of his soul, which it enjoys alone by itself, whilst he sleeps, without perceiving any thing of it, any more than he has for the happiness or misery of a man in the Indies, whom he knows not. For if we take wholly away all consciousness of our actions and sensations, especially, of pleasure and pain, and the concernment that accompanies it, it will be hard to know wherein to place personal identity.

§ 12. *If a sleeping man thinks without knowing it, the sleeping and waking man are two persons.*—The soul, during sound sleep, thinks, say these men. Whilst it thinks and perceives, it is capable certainly of those of delight or trouble, as well as any other perceptions; and it must necessarily be conscious of its own perceptions. But it has all this apart. The sleeping man, it is plain, is conscious of nothing of all this. Let us suppose, then, that the soul of Castor, while he is sleeping, retired from his body, which is no impossible supposition for the men I have here to do with, who so liberally allow life, without a thinking soul, to all other animals. These men cannot then judge it impossible, or a contradiction, that the body should live without the soul; nor that the soul should subsist and think, or have perception, even perception of happiness or misery, without the body. Let us then, as I say, suppose the soul of Castor separated, during his sleep, from his body, to think apart. Let us suppose, too, that it chooses for its scene of thinking, the body of another man, v. g. Pollux, who is sleeping without a soul; for if Castor's soul can think whilst Castor is asleep, what Castor is never conscious of, it is no matter what place it chooses to think in. We have here, then, the bodies of two men, with only one soul between them, which we will suppose to sleep and wake by turns; and the soul still thinking in the waking man, whereof the sleeping man is never conscious, has never the least perception. I ask, then, whether Castor and Pollux, thus, with only one soul between them, which thinks and perceives in one, what the other is never conscious of, nor is concerned for, are not two as distinct persons as Castor and Hercules, or as Socrates and Plato were? And whether one of them might not be very happy, and the other very miserable? Just by the same reason, they make the soul and the man two persons, who make the soul think apart, what the man is not conscious of. For, I suppose, nobody will make identity of person to consist in the soul's being united to the very same numerical particles of matter; for if that be necessary to identity, it will be impossible, in that constant flux of the particles of our bodies, that any man should be the same person two days, or two moments, together.

§ 13. *Impossible to convince those that sleep without dreaming, that they think.*—Thus, methinks, every drowsy nod shakes their doctrine, who teach, that the soul is always thinking. Those, at least, who do at any time sleep without dreaming, can never be convinced, that their thoughts are sometimes for four hours busy without their knowing of it; and if they are taken in the very act, waked in the middle of that sleeping contemplation, can give no manner of account of it.

§ 14. *That men dream without remembering it, in vain urged.*—It will, perhaps, be said, “that the soul thinks, even in the soundest sleep, but the memory retains it not.” That the soul in a sleeping man should be this moment busy thinking, and the next moment in a waking man, not remember, nor be able to recollect one jot of all those thoughts, is very hard to be conceived, and would need some better proof than bare assertion, to make it be believed. For who can, without any more ado, but being barely told so, imagine, that the greatest part of men do, during all their lives, for several hours every day, think of some-

thing, which, if they were asked, even in the middle of these thoughts, they could remember nothing at all of? Most men, I think, pass a great part of their sleep without dreaming. I once knew a man that was bred a scholar, and had no bad memory, who told me he had never dreamed in his life till he had that fever he was then newly recovered of, which was about the five or six and twentieth year of his age. I suppose the world affords more such instances: at least every one's acquaintance will furnish him with examples enough of such as pass most of their nights without dreaming.

§ 15. *Upon this hypothesis, the thoughts of a sleeping man ought to be most rational.*—To think often, and never to retain it so much as one moment, is a very useless sort of thinking: and the soul, in such a state of thinking, does very little, if at all, excel that of a looking-glass, which constantly receives variety of images, or ideas, but retains none; they disappear and vanish, and there remain no footsteps of them: the looking-glass is never the better for such ideas, nor the soul for such thoughts. Perhaps it will be said, "that in a waking man, the materials of the body are employed and made use of in thinking; and that the memory of thoughts is retained by the impressions that are made on the brain, and the traces there left after such thinking: but that in the thinking of the soul, which is not perceived in a sleeping man, there the soul thinks apart, and making no use of the organs of the body, leaves no impressions on it, and consequently no memory of such thoughts." Not to mention again the absurdity of two distinct persons, which follows from this supposition, I answer farther, that whatever ideas the mind can receive, and contemplate without the help of the body, it is reasonable to conclude, it can retain without the help of the body too, or else the soul, or any separate spirit, will have but little advantage by thinking. If it has no memory of its own thoughts; if it cannot lay them up for its own use, and be able to recal them upon occasion; if it cannot reflect upon what is past, and make use of its former experiences, reasonings, and contemplations, to what purpose does it think? They, who make the soul a thinking thing, at this rate, will not make it a much more noble being, than those do, whom they condemn, for allowing it to be nothing but the subtlest parts of matter. Characters drawn on dust, that the first breath of wind effaces; or impressions made on a heap of atoms, or animal spirits, are altogether as useful, and render the subject as noble, as the thoughts of a soul that perish in thinking; that once out of sight, are gone for ever, and leave no memory of themselves behind them. Nature never makes excellent things for mean or no uses: and it is hardly to be conceived, that our infinite wise Creator should make so admirable a faculty as the power of thinking, that faculty which comes nearest the excellency of His own incomprehensible being, to be so idly and uselessly employed, at least a fourth part of its time here, as to think constantly, without remembering any of those thoughts, without doing any good to itself or others, or being any way useful to any other part of the creation. If we will examine it, we shall not find, I suppose, the motion of dull and senseless matter, any where in the universe, made so little use of, and so wholly thrown away.

§ 16. *On this hypothesis the soul must have ideas not derived from sensation or reflection, of which there is no appearance.*—It is true, we have sometimes instances of perception, whilst we are asleep, and retain the memory of those thoughts: but how extravagant and incoherent for the most part they are, how little conformable to the perfection and order of a rational being, those who are acquainted with dreams, need not be told. This I would willingly be satisfied in, whether the soul, when it thinks thus apart, and as it were separate from body, acts less rationally than when conjointly with it or no: if its separate thoughts be less rational, then these men must say, that the soul owes the perfection of rational thinking to the body: if it does not, it is a wonder that our dreams should be, for the most part, so frivolous and irrational; and that the soul should retain none of its more rational soliloquies and meditations.

§ 17. *If I think when I know it not, nobody else can know it.*—Those who so confidently tell us, that “the soul always actually thinks,” I would they would also tell us, what those ideas are that are in the soul of a child, before, or just at the union with the body, before it hath received any by sensation. The dreams of sleeping men are, as I take it, all made up of the waking man’s ideas, though, for the most part, oddly put together. It is strange if the soul has ideas of its own, that it derived not from sensation or reflection (as it must have, if it thought before it received any impressions from the body), that it should never, in its private thinking (so private that the man himself perceives it not), retain any of them, the very moment it wakes out of them, and then make the man glad with new discoveries. Who can find it reasonable that the soul should, in its retirement, during sleep, have so many hours’ thoughts, and yet never light on any of those ideas it borrowed not from sensation or reflection; or, at least, preserve the memory of none but such, which being occasioned from the body must needs be less natural to a spirit? It is strange the soul should never once in a man’s whole life, recal over any of its pure native thoughts, and those ideas it had before it borrowed any thing from the body; never bring into the waking man’s view, any other ideas but what have a tang of the cask, and manifestly derive their original from that union. If it always thinks, and so had ideas before it was united, or before it received any from the body, it is not to be supposed, but that, during sleep, it recollects its native ideas, and during that retirement from communicating with the body, whilst it thinks by itself, the ideas it is busied about, should be, sometimes at least, those more natural and congenial ones which it had in itself, underived from the body, or its own operations about them: which, since the waking man never remembers, we must, from this hypothesis, conclude, either that the soul remembers something that the man does not, or else that memory belongs only to such ideas as are derived from the body, or the mind’s operations about them.

§ 18. *How knows any one that the soul always thinks? For if it be not a self-evident proposition, it needs proof.*—I would be glad also to learn from these men, who so confidently pronounce, that the human soul, or which is all one, that a man always thinks, how they come to

know it? nay, "how they come to know that they themselves think, when they themselves do not perceive it?" This, I am afraid, is to be sure without proofs; and to know, without perceiving: it is, I suspect, a confused notion, taken up to serve an hypothesis; and none of those clear truths, that either their own evidence forces us to admit, or common experience makes it impudence to deny. For the most that can be said of it is, that it is possible the soul may always think, but not always retain it in memory: and I say, it is as possible, that the soul may not always think, and much more probable, that it should sometimes not think, than that it should often think, and that a long while together, and not be conscious to itself the next moment after, that it had thought.

§ 19. *That a man should be busy in thinking, and yet not retain the next moment, very improbable.*—To suppose the soul to think, and the man not to perceive it, is, as has been said, to make two persons in one man: and if one considers well these men's way of speaking, one should be led into a suspicion, that they do so. For they who tell us, that the soul always thinks, do never, that I remember, say, that a man always thinks. Can the soul think, and not the man? or a man think, and not be conscious of it? This, perhaps, would be suspected of jargon in others. If they say, the man thinks always, but is not always conscious of it; they may as well say, his body is extended without having parts. For it is altogether as intelligible to say, that a body is extended without parts, as that any thing thinks without being conscious of it, or perceiving that it does so. They who talk thus, may, with as much reason, if it be necessary to their hypothesis, say, that a man is always hungry, but that he does not always feel it: whereas, hunger consists in that very sensation, as thinking consists in being conscious that one thinks. If they say, that a man is always conscious to himself of thinking; I ask, how they know it? Consciousness is the perception of what passes in a man's own mind. Can another man perceive that I am conscious of any thing, when I perceive it not myself? No man's knowledge here, can go beyond his experience. Wake a man out of a sound sleep, and ask him, what he was that moment thinking of? If he himself be conscious of nothing he then thought on, he must be a notable diviner of thoughts, that can assure him that he was thinking: may he not with more reason assure him he was not asleep? This is something beyond philosophy; and it cannot be less than revelation, that discovers to another, thoughts in my mind, when I can find none there myself: and they must needs have a penetrating sight, who can certainly see that I think, when I cannot perceive it myself, and when I declare that I do not; and yet can see that dogs or elephants do not think, when they give all the demonstration of it imaginable, except only telling us that they do so. This some may suspect to be a step beyond the Rosicrucians; it seeming easier to make one's self invisible to others, than to make another's thoughts visible to me, which are not visible to himself. But it is but defining the soul to be a substance that always thinks, and the business is done. If such a definition be of any authority, I know not what it can serve for, but to make many men suspect that they have no souls at all, since they find a good part of their lives pass away without thinking. For

no definitions that I know, no suppositions of any sect, are of force enough to destroy constant experience; and perhaps it is the affectation of knowing beyond what we perceive, that makes so much useless dispute and noise in the world.

§ 20. *No ideas but from sensation or reflection, evident, if we observe children.*—I see no reason, therefore, to believe that the soul thinks before the senses have furnished it with ideas to think on; and as those are increased and retained, so it comes by exercise, to improve its faculty of thinking in the several parts of it, as well as afterward, by compounding those ideas, and reflecting on its own operations; it increases its stock, as well as facility, in remembering, imagining, reasoning, and other modes of thinking.

§ 21. He that will suffer himself to be informed by observation and experience, and not make his own hypothesis the rule of nature, will find few signs of a soul accustomed to much thinking in a new-born child, and much fewer of any reasoning at all. And yet it is hard to imagine, that the rational soul should think so much and not reason at all. And he that will consider, that infants, newly come into the world, spend the greatest part of their time in sleep, and are seldom awake, but when either hunger calls for the teat, or some pain (the most importunate of all sensations), or some other violent impression on the body, forces the mind to perceive and attend to it. He, I say, who considers this, will, perhaps, find reason to imagine, that a foetus in the mother's womb, differs not much from the state of a vegetable; but passes the greatest part of its time without perception or thought, doing very little in a place where it needs not seek for food, and is surrounded with liquor, always equally soft, and near of the same temper; where the eyes have no light, and the ears, so shut up, are not very susceptible of sounds; and where there is little or no variety or change of objects to move the senses.

§ 22. Follow a child from its birth, and observe the alterations that time makes, and you shall find, as the mind by the senses comes more and more to be furnished with ideas, it comes to be more and more awake; thinks more, the more it has matter to think on. After some time, it begins to know the objects, which being most familiar with it, have made lasting impressions. Thus it comes, by degrees, to know the persons it daily converses with, and distinguish them from strangers; which are instances and effects of its coming to retain and distinguish the ideas the senses convey to it: and so we may observe, how the mind, by degrees, improves in these, and advances to the exercise of those other faculties of enlarging, compounding, and abstracting its ideas, and of reasoning about them, and reflecting upon all these, of which I shall have occasion to speak more hereafter.

§ 23. If it shall be demanded then, when a man begins to have any ideas? I think the true answer is, when he first has any sensation. For since there appear not to be any ideas in the mind, before the senses have conveyed any in, I conceive that ideas in the understanding are coeval with sensation: which is such an impression or motion, made in some part of the body, as produces some perception in the understanding. It is about these impressions made on our senses by

outward objects, that the mind seems first to employ itself in such operations as we call perception, remembering, consideration, reasoning, &c.

§ 24. *The original of all our knowledge.*—In time, the mind comes to reflect on its own operations, about the ideas got by sensation, and thereby stores itself with a new set of ideas, which I call ideas of reflection. These are the impressions that are made on our senses by outward objects, that are extrinsic to the mind; and its own operations, proceeding from powers intrinsic and proper to itself, which when reflected on by itself, becoming also objects of its contemplation, are, as I have said, the original of all knowledge. Thus the first capacity of human intellect is, that the mind is fitted to receive the impressions made on it, either through the senses, by outward objects, or by its own operations, when it reflects on them. This is the first step a man makes towards the discovery of any thing, and the ground-work whereon to build all those notions which ever he shall have naturally in this world. All those sublime thoughts which tower above the clouds, and reach as high as Heaven itself, take their rise and footing here: in all that good extent wherein the mind wanders, in those remote speculations, it may seem to be elevated with, it stirs not one jot beyond those ideas which sense or reflection have offered for its contemplation.

§ 25. *In the reception of simple ideas, the understanding is for the most part passive.*—In this part, the understanding is merely passive; and whether or no it will have these beginnings, and as it were materials of knowledge, is not in its own power. For the objects of our senses do, many of them, obtrude their particular ideas upon our minds, whether we will or no: and the operations of our minds will not let us be without, at least, some obscure notions of them. No man can be wholly ignorant of what he does when he thinks. These simple ideas, when offered to the mind, the understanding can no more refuse to have, nor alter, when they are imprinted, nor blot them out and make new ones itself, than a mirror can refuse, alter, or obliterate the images or ideas which the objects set before it do therein produce. As the bodies that surround us do diversely affect our organs, the mind is forced to receive the impressions, and cannot avoid the perception of those ideas that are annexed to them.

CHAP. II.

OF SIMPLE IDEAS.

§ 1. *Uncompounded appearances.*—The better to understand the nature, manner, and extent of our knowledge, one thing is carefully to be observed concerning the ideas we have; and that is, that some of them are simple, and some complex.

Though the qualities that affect our senses, are, in the things themselves, so united and blended, that there is no separation, no distance between them; yet, it is plain, the ideas they produce in the mind, enter by the senses, simple and unmixed. For though the sight and touch often take in from the same object, at the same time, different

ideas; as a man sees at once motion and colour; the hand feels softness and warmth in the same piece of wax; yet the simple ideas thus united in the same subject, are as perfectly distinct as those that come in by different senses: the coldness and hardness which a man feels in a piece of ice, being as distinct ideas in the mind, as the smell and whiteness of the lily, or as the taste of sugar, and smell of a rose. And there is nothing can be plainer to a man, than the clear and distinct perceptions he has of those simple ideas; which being each in itself uncompounded, contains in it nothing but one uniform appearance or conception in the mind, and is not distinguishable into different ideas.

§ 2. *The mind can neither make nor destroy them.*—The simple ideas, the materials of all our knowledge, are suggested and furnished to the mind, only by those two ways above-mentioned, viz. sensation and reflection.* When the understanding is once stored with these

* Against this, that the materials of all our knowledge are suggested and furnished to the mind only by sensation and reflection, the Bishop of Worcester makes use of the idea of substance in these words: “If the idea of substance be grounded upon plain and evident reason, then we must allow an idea of substance, which comes not in by sensation or reflection; and so we may be certain of something which we have not by these ideas.”

To which our author^a answers: “These words of your lordship contain nothing, as I see, in them, against me; for I never said that the general idea of substance comes in by sensation and reflection; or that it is a simple idea of sensation or reflection, though it be ultimately founded in them; for it is a complex idea, made up of the general idea of something, or being, with the relation of a support to accidents. For general ideas come not into the mind by sensation or reflection, but are the creatures or inventions of the understanding, as, I think, I have shewn;^b and also how the mind makes them from ideas which it has got by sensation and reflection; and as to the ideas of relation, how the mind forms them, and how they are derived from, and ultimately terminate in, ideas of sensation and reflection, I have likewise shewn.

“But that I may not be mistaken what I mean, when I speak of ideas of sensation and reflection, as the materials of all our knowledge; give me leave, my lord, to set down here a place or two, out of my book, to explain myself; as I thus speak of ideas of sensation and reflection:

“That these, when we have taken a full survey of them, and their several modes, and the compositions made out of them, we shall find to contain all our whole stock of ideas, and we have nothing in our minds which did not come in one of these two ways.^c This thought, in another place, I express thus:

“These are the most considerable of those simple ideas which the mind has, and out of which is made all its other knowledge; all which it receives by the two forementioned ways of sensation and reflection.”^d And,

“Thus I have in a short draught given a view of our original ideas, from whence all the rest are derived, and of which they are made up.”^e

“This, and the like, said in other places, is what I have thought concerning ideas of sensation and reflection, as the foundation and materials of all our ideas, and consequently of all our knowledge: I have set down these particulars out of my book, that the reader, having a full view of my opinion herein, may the better see what in it is liable to your lordship’s reprehension. For that your lordship is not very well satisfied with it, appears not only by the words under consideration, but by these also: ‘But we are still told, that our understanding can have no other ideas, but either from sensation or reflection.’

“Your lordship’s argument, in the passage we are upon stands thus: ‘If the general idea of substance be grounded upon plain and evident reason, then we must allow an idea of substance, which comes not in by sensation or reflection.’ This is a consequence which, with submission, I think, will not hold, because it is founded upon a supposition which I think will not hold, viz. ‘That reason and ideas are inconsistent;’ for if that supposition be not true, then the general idea of substance may be grounded on plain and evident reason; and yet it will not follow from thence, that it is not ultimately grounded on and derived

simple ideas, it has the power to repeat, compare, and unite them, even to an almost infinite variety, and so can make at pleasure new complex ideas. But it is not in the power of the most exalted wit, or enlarged understanding, by any quickness or variety of thought, to invent or frame one new simple idea in the mind, not taken in by the ways before mentioned: nor can any force of the understanding destroy those that are there. The dominion of man, in this little world of his own understanding, being much-what the same as it is in the great world of visible things; wherein his power, however managed by art and skill, reaches no farther than to compound and divide the materials that are made to his hand; but can do nothing towards the making the least particle of new matter, or destroying one atom of what is already in being. The same inability will every one find in himself, who shall go about to fashion in his understanding any simple idea not received in by his senses from external objects; or by reflection from the operations of his own mind about them. I would have any one try to fancy any taste, which had never affected his palate; or frame the idea of a scent he had never smelt: and when he can do this, I will also con-

from ideas which come in by sensation or reflection, and so cannot be said to come in by sensation or reflection.

“To explain myself, and clear my meaning in this matter, all the ideas of all the sensible qualities of a cherry, come into my mind by sensation; the ideas of perceiving, thinking, reasoning, knowing, &c. come into my mind by reflection. The ideas of these qualities and actions, or powers, are perceived by the mind, to be by themselves inconsistent with existence; or, as your lordship well expresses it, ‘we find that we can have no true conception of any modes or accidents, but we must conceive a substratum, or subject, wherein they are, i. e. that they cannot exist or subsist of themselves.’ Hence the mind perceives their necessary connexion with inference, or being supported, which being a relative idea, superadded to the red colour in a cherry, or to thinking in a man, the mind frames the correlative idea of a support. For I never denied, that the mind could frame to itself ideas of relation, but have shewed the quite contrary in my chapters about relation. But because a relation cannot be founded in nothing, or be the relation of nothing, and the thing here related as a supporter, or a support, is not represented to the mind by any clear and distinct idea; therefore, the obscure and indistinct vague idea of thing, or something, is all that is left to be the positive idea, which has the relation of a support, or substratum, to modes or accidents; and that general indetermined idea of something, is, by the abstraction of the mind, derived also from the simple ideas of sensation and reflection; and thus the mind, from the positive simple ideas got by sensation and reflection, comes to the general relative idea of substance, which, without these positive simple ideas, it would never have.

“This your lordship (without giving by detail all the particular steps of the mind in this business) has well expressed in this more familiar way: ‘We find we can have no true conception of any modes or accidents, but we must conceive a substratum, or subject, wherein they are; since it is a repugnancy to our conceptions of things, that modes or accidents should subsist by themselves.’

“Hence your lordship calls it the rational idea of substance. And says, ‘I grant, that by sensation and reflection we come to know the powers and properties of things; but our reason is satisfied that there must be something beyond these, because it is impossible that they should subsist by themselves;’ so that if this be what your lordship means by rational idea of substances, I see nothing there is in it against what I have said, that it is founded on simple ideas of sensation or reflection, and that it is a very obscure idea.

“Your lordship’s conclusion from your foregoing words, is, ‘And so we may be certain of some things which we have not by those ideas;’ which is a proposition, whose precise meaning your lordship will forgive me, if I profess, as it stands there, I do not understand. For it is uncertain to me, whether your lordship means, we may certainly know the existence of something, which we have not by those ideas; or certainly know the distinct properties of something, which we have not by those ideas; or certainly know the truth of some proposition, which we have not by those ideas; for to be certain of something, may signify either of these: but in which soever of these it be meant, I do not see how I am concerned in it.”

clude, that a blind man hath ideas of colours, and a deaf man true distinct notions of sounds.

§ 3. This is the reason why, though we cannot believe it impossible to God to make a creature with other organs, and more ways to convey into the understanding the notice of corporeal things than those five, as they are usually counted, which he has given to man: yet I think it is not possible for any one to imagine any other qualities in bodies, howsoever constituted, whereby they can be taken notice of, besides sounds, tastes, smells, visible and tangible qualities. And had mankind been made but with four senses, the qualities then, which are the object of the fifth sense, had been as far from our notice, imagination, and conception, as now any belonging to a sixth, seventh, or eighth sense, can possibly be: which, whether yet some other creatures, in some other parts of this vast and stupendous universe, may not have, will be a great presumption to deny. He that will not set himself proudly at the top of all things, but will consider the immensity of this fabric, and the great variety that is to be found in this little and inconsiderable part of it, which he has to do with, may be apt to think, that in other mansions of it, there may be other and different intelligent beings, of whose faculties he has as little knowledge or apprehension, as a worm shut up in one drawer of a cabinet hath of the senses or understanding of a man; such variety and excellency being suitable to the wisdom and power of the Maker. I have here followed the common opinion of man's having but five senses, though, perhaps, there may be justly counted more; but either supposition serves equally to my present purpose.

CHAP. III.

OF IDEAS OF ONE SENSE.

§ 1. *Division of simple ideas.*—The better to conceive the ideas we receive from sensation, it may not be amiss for us to consider them, in reference to the different ways whereby they make their approaches to our minds, and make themselves perceivable by us.

First, Then, there are some which come into our minds by one sense only.

Secondly, There are others, that convey themselves into the mind by more senses than one.

Thirdly, Others that are had from reflection only.

Fourthly, There are some that make themselves way, and are suggested to the mind by all the ways of sensation and reflection.

We shall consider them apart, under these several heads.

First, There are some ideas which have admittance only through one sense, which is peculiarly adapted to receive them. Thus light and colours, as white, red, yellow, blue, with their several degrees or shades, and mixtures, as green, scarlet, purple, sea-green, and the rest, come in only by the eyes: all kind of noises, sounds, and tones, only by the ears: and the several tastes and smells, by the nose and palate. And if these organs, or the nerves which are the conduits to convey them from without to their audience in the brain, the mind's presence-room (as I may so call it), are any of them so disordered, as not to perform

their functions, they have no postern to be admitted by ; no other way to bring themselves into view, and be perceived by the understanding.

The most considerable of those belonging to the touch, are heat, and cold, and solidity ; all the rest, consisting almost wholly in the sensible configuration, as smooth and rough ; or else more or less firm adhesion of the parts, as hard and soft, rough and brittle, are obvious enough.

§ 2. I think it will be needless to enumerate all the particular simple ideas belonging to each sense ; nor indeed is it possible, if we would, there being a great many more of them belonging to most of the senses than we have names for. The variety of smells, which are as many almost, if not more, than species of bodies in the world, do most of them want names. Sweet and stinking, commonly serve our turn for these ideas ; which, in effect, is little more than to call them pleasing or displeasing ; though the smell of a rose and violet, both sweet, are certainly very distinct ideas. Nor are the different tastes, that by our palates we receive ideas of, much better provided with names. Sweet, bitter, sour, harsh, and salt, are almost all the epithets we have to denominate that numberless variety of relishes, which are to be found distinct, not only in almost every sort of creatures, but in the different parts of the same plant, fruit, or animal. The same may be said of colours and sounds. I shall, therefore, in the account of simple ideas I am here giving, content myself to set down only such as are most material to our present purpose, or are in themselves less apt to be taken notice of, though they are very frequently the ingredients of our complex ideas, amongst which, I think, I may well account solidity : which, therefore, I shall treat of in the next chapter.

CHAP. IV.

OF SOLIDITY.

§ 1. *We receive this idea from touch.*—The idea of solidity we receive by our touch : and it arises from the resistance which we find in body, to the entrance of any other body into the place it possesses, till it has left it. There is no idea which we receive more constantly from sensation than solidity. Whether we move, or rest, in what posture soever we are, we always feel something under us, that supports us, and hinders our farther sinking downwards ; and the bodies which we daily handle, make us perceive, that whilst they remain between them they do, by an unsurmountable force, hinder the approach of the parts of our hands that press them. That which thus hinders the approach of two bodies, when they are moved one towards another, I call solidity. I will not dispute, whether this acceptation of the word solid be nearer to its original signification, than that which mathematicians use it in : it suffices that I think the common notion of solidity will allow, if not justify, this use of it ; but if any one think it better to call it “ impenetrability,” he has my consent : only I have thought the term solidity the more proper to express this idea, not only because of its vulgar use in that sense, but also because it carries something more of positive in it than impenetrability, which is negative, and is, perhaps, more a consequence of solidity, than solidity itself. This, of all others,

seems the idea most intimately connected with, and essential to, body, so as no where else to be found or imagined but only in matter. And though our senses take no notice of it, but in masses of matter, of a bulk sufficient to cause a sensation in us: yet the mind, having once got this idea from such grosser sensible bodies, traces it farther, and considers it, as well as figure, in the minutest particle of matter that can exist; and finds it inseparably inherent in body, wherever, or however modified.

§ 2. *Solidity fills space.*—This is the idea which belongs to body, whereby we conceive it to fill space. The idea of which filling of space is, that where we imagine any space taken up by a solid substance, we conceive it so to possess it, that it excludes all other solid substances: and will for ever hinder any two other bodies, that move towards one another in a straight line, from coming to touch one another, unless it removes from between them in a line not parallel to that which they move in. This idea of it, the bodies which we ordinarily handle, sufficiently furnish us with.

§ 3. *Distinct from space.*—This resistance, whereby it keeps other bodies out of the space which it possesses, is so great, that no force, how great soever, can surmount it. All the bodies in the world, pressing a drop of water on all sides, will never be able to overcome the resistance which it will make, soft as it is, to their approaching one another, till it be removed out of their way: whereby our idea of solidity is distinguished both from pure space, which is capable neither of resistance nor motion; and from the ordinary idea of hardness. For a man may conceive two bodies at a distance, so as they may approach one another, without touching or displacing any solid thing, till their superficies come to meet: whereby I think, we have the clear idea of space without solidity. For (not to go so far as annihilation of any particular body) I ask, whether a man cannot have the idea of the motion of one single body alone, without any other succeeding immediately into its place? I think it is evident he can: the idea of motion in one body, no more including the idea of motion in another, than the idea of a square figure in one body, includes the idea of a square figure in another. I do not ask whether bodies do so exist, that the motion of one body cannot really be without the motion of another. To determine this either way is to beg the question for or against a vacuum. But my question is, whether one cannot have the idea of one body moved, whilst others are at rest? And, I think, this no one will deny; if so, then the place it deserted gives us the idea of pure space, without solidity, whereinto any other body may enter, without either resistance or protrusion of any thing. When the sucker in a pump is drawn, the space it filled in the tube is certainly the same, whether any body follows the motion of the sucker or no; nor does it imply a contradiction, that upon the motion of one body, another, that is only contiguous to it, should not follow it. The necessity of such a motion is built only on the supposition, that the world is full; but not on the distinct ideas of space and solidity; which are as different as resistance and not resistance, and protrusion and not protrusion. And that men have ideas of space without a body, their very disputes about a vacuum plainly demonstrate, as is shewed in another place.

§ 4. *From hardness.*—Solidity is hereby also differenced from hardness, in, that solidity consists in repletion, and so an utter exclusion of other bodies out of the space it possesses ; but hardness, in a firm cohesion of the parts of matter, making up masses of a sensible bulk ; so that the whole does not easily change its figure. And, indeed, hard and soft are names that we give to things, only in relation to the constitutions of our own bodies ; that being generally called hard by us, which will put us to pain, sooner than change figure by the pressure of any part of our bodies ; and that, on the contrary, soft, which changes the situation of its parts upon an easy and unpainful touch.

But this difficulty of changing the situation of the sensible parts amongst themselves or of the figure of the whole, gives no more solidity to the hardest body in the world, than to the softest ; nor is an adamant one jot more solid than water. For though the two flat sides of two pieces of marble, will more easily approach each other, between which there is nothing but water or air, than if there be a diamond between them ; yet it is not, that the parts of the diamond are more solid than those of water, or resist more ; but because the parts of water being more easily separable from each other, they will, by a side motion, be more easily removed, and give way to the approach of the two pieces of marble : but if they could be kept from making place by that side motion, they would eternally hinder the approach of these two pieces of marble, as much as the diamond ; and it would be as impossible, by any force, to surmount their resistance, as to surmount the resistance of the parts of a diamond. The softest body in the world will as invincibly resist the coming together of any other two bodies, if it be not put out of the way, but remain between them, as the hardest that can be found or imagined. He that shall fill a yielding soft body well with air or water, will quickly find its resistance ; and he that thinks that nothing but bodies that are hard can keep his hands from approaching one another, may be pleased to make a trial with the air inclosed in a foot-ball. The experiment, I have been told, was made at Florence, with a hollow globe of gold filled with water, and exactly closed, which farther shews the solidity of so soft a body as water ; for the golden globe thus filled, being put into a press, which was driven by the extreme force of screws, the water made itself way through the pores of that very close metal, and finding no room for a nearer approach of its particles within, got to the outside, where it rose like a dew, and so fell in drops, before the sides of the globe could be made to yield to the violent compression of the engine that squeezed it.

§ 5. *On solidity depend impulse, resistance, and protrusion.*—By this idea of solidity, is the extension of body distinguished from the extension of space. The extension of body being nothing but the cohesion or continuity of solid, separable, moveable parts ; and the extension of space, the continuity of unsolid, inseparable, and immoveable parts. Upon the solidity of bodies also depends their mutual impulse, resistance, and protrusion. Of pure space then, and solidity, there are several (amongst which I confess myself one) who persuade themselves they have clear and distinct ideas : and that they can think on space without any thing in it that resists, or is protruded by body. This is the idea of

pure space, which they think they have as clear as any idea they can have of the extension of body; the idea of the distance between the opposite parts of a concave superficies being equally as clear without, as with the idea of any solid parts between; and on the other side, they persuade themselves, that they have, distinct from that of pure space, the idea of something that fills space, that can be protruded by the impulse of other bodies, or resist their motion. If there be others that have not these two ideas distinct, but confound them, and make but one of them, I know not how men, who have the same idea, under different names, or different ideas under the same name, can, in that case, talk with one another; any more than a man, who, not being blind or deaf, has distinct ideas of the colour of scarlet, and the sound of a trumpet, could discourse concerning scarlet colour with the blind man I mention in another place, who fancied that the idea of scarlet was like the sound of a trumpet.

§ 6. *What it is.*—If any one asks me what this solidity is? I send him to his senses to inform him: let him put a flint or a foot-ball between his hands, and then endeavour to join them, and he will know. If he thinks this not a sufficient explication of solidity, what it is, and wherein it consists, I promise to tell him what it is, and wherein it consists, when he tells me what thinking is, or wherein it consists, or explains to me what extension or motion is, which, perhaps, seems much easier. The simple ideas we have, are such as experience teaches them us; but if, beyond that, we endeavour, by words, to make them clearer in the mind, we shall succeed no better than if we went about to clear up the darkness of a blind man's mind by talking, and to discourse into him the ideas of light and colours. The reason of this I shall shew in another place.

CHAP. V.

OF SIMPLE IDEAS OF DIVERS SENSES.

THE ideas we get by more than one sense, are of space or extension, figure, rest, and motion; for these make perceivable impressions both on the eyes and touch; and we can receive and convey into our minds the ideas of the extension, figure, motion, and rest of bodies, both by seeing and feeling. But having occasion to speak more at large of these in another place, I here only enumerate them.

CHAP. VI.

OF SIMPLE IDEAS OF REFLECTION.

§ 1. *Simple ideas are the operations of the mind about its other ideas.*—The mind receiving the ideas, mentioned in the foregoing chapters, from without, when it turns its views inward upon itself, and observes its own actions about those ideas it has, takes from thence other ideas, which are as capable to be the objects of its contemplation, as any of those it received from foreign things.

§ 2. *The idea of perception, and idea of willing, we have from reflection.*—The two great and principal actions of the mind, which are

most frequently considered, and which are so frequent, that every one that pleases, may take notice of them in himself, are these two : perception, or thinking ; and volition, or willing. The power of thinking is called the understanding, and the power of volition is called the will : and these two powers or abilities in the mind, are denominated faculties. Of some of the modes of these simple ideas of reflection, such as are remembrance, discerning, reasoning, judging, knowledge, faith, &c., I shall have occasion to speak hereafter.

CHAP. VII.

OF SIMPLE IDEAS OF BOTH SENSATION AND REFLECTION.

§ 1. *Pleasure and pain.*—There be other simple ideas which convey themselves into the mind, by all the ways of sensation and reflection, viz. pleasure or delight ; and its opposite, pain or uneasiness ; power ; existence ; unity.

§ 2. Delight, or uneasiness, one or other of them join themselves to almost all our ideas, both of sensation and reflection ; and there is scarce any affection of our senses from without, any retired thought of our mind within, which is not able to produce in us pleasure or pain. By pleasure and pain, I would be understood to signify whatsoever delights or molests us most, whether it arises from the thoughts of our minds, or any thing operating on our bodies. For whether we call it satisfaction, delight, pleasure, happiness, &c. on the one side ; or uneasiness, trouble, pain, torment, anguish, misery, &c. on the other, they are still but different degrees of the same thing, and belong to the ideas of pleasure and pain, delight or uneasiness ; which are the names I shall most commonly use for those two sorts of ideas.

§ 3. The infinitely wise Author of our being, having given us the power over several parts of our bodies, to move or keep them at rest, as we think fit ; and also, by the motion of them, to move ourselves and our contiguous bodies, in which consists all the actions of our body ; having also given a power to our minds, in several instances, to choose, amongst its ideas, which it will think on, and to pursue the inquiry of this or that subject, with consideration and attention, to excite us to these actions of thinking and motion, that we are capable of, has been pleased to join to several thoughts, and several sensations, a perception of delight. If this were wholly separated from all our outward sensations, and inward thoughts, we should have no reason to prefer one thought or action to another ; negligence to attention, or motion to rest. And so we should neither stir our bodies, nor employ our minds ; but let our thoughts (if I may so call it) run adrift, without any direction or design ; and suffer the ideas of our minds, like unregarded shadows, to make their appearances there, as it happened, without attending to them. In which state, man, however furnished with the faculties of understanding and will, would be a very idle inactive creature, and pass his time only in a lazy lethargic dream. It has, therefore, pleased our wise Creator, to annex to several objects, and the ideas which we receive from them, as also to several of our thoughts, a concomitant pleasure, and that in several objects, to several degrees : that those

faculties which he had endowed us with, might not remain wholly idle and unemployed by us.

§ 4. Pain has the same efficacy and use to set us on work, that pleasure has, we being as ready to employ our faculties to avoid that, as to pursue this; only this is worth our consideration, "that pain is often produced by the same objects and ideas that produce pleasure in us." This, their near conjunction, which makes us often feel pain in the sensations where we expected pleasure, gives us new occasion of admiring the wisdom and goodness of our Maker, who, designing the preservation of our being, has annexed pain to the application of many things to our bodies, to warn us of the harm that they will do, and as advices to withdraw from them. But He, not designing our preservation barely, but the preservation of every part and organ in its perfection, hath, in many cases, annexed pain to those very ideas which delight us. Thus, heat, that is very agreeable to us in one degree, by a little greater increase of it, proves no ordinary torment; and the most pleasant of all sensible objects, light itself, if there be too much of it, if increased beyond a due proportion to our eyes, causes a very painful sensation; which is wisely and favourably so ordered by nature, that when any object does, by the vehemency of its operation, disorder the instruments of sensation, whose structures cannot but be very nice and delicate, we might, by the pain, be warned to withdraw, before the organ be quite put out of order, and so be unfitted for its proper function for the future. The consideration of those objects that produce it, may well persuade us, that this is the end or use of pain. For though great light be insufferable to our eyes, yet the highest degree of darkness does not at all disease them; because that causing no disorderly motion in it, leaves that curious organ unharmed, in its natural state. But yet excess of cold, as well as heat, pains us; because it is equally destructive to that temper, which is necessary to the preservation of life, and the exercise of the several functions of the body, and which consists in a moderate degree of warmth, or, if you please, a motion of the insensible parts of our bodies, confined within certain bounds.

§ 5. Beyond all this, we may find another reason why God hath scattered up and down several degrees of pleasure and pain in all the things that environ and affect us, and blended them together in almost all that our thoughts and senses have to do with; that we finding imperfection, dissatisfaction, and want of complete happiness, in all the enjoyments which the creatures can afford us, might be led to seek it in the enjoyment of Him, "with whom there is fulness of joy, and at whose right hand are pleasures for evermore."

§ 6. *Pleasure and pain.*—Though what I have here said may not, perhaps, make the ideas of pleasure and pain clearer to us than our own experience does, which is the only way that we are capable of having them; yet the consideration of the reason why they are annexed to so many other ideas, serving to give us due sentiments of the wisdom and goodness of the Sovereign Disposer of all things, may not be unsuitable to the main end of these inquiries; the knowledge and veneration of Him, being the chief end of all our thoughts, and the proper business of all understandings.

§ 7. *Existence and unity.*—Existence and unity are two other ideas, that are suggested to the understanding by every object without, and every idea within. When ideas are in our minds, we consider them as being actually there, as well as we consider things to be actually without us; which is, that they exist, or have existence; and whatever we can consider as one thing, whether a real being, or idea, suggests to the understanding the idea of unity.

§ 8. *Power.*—Power also is another of those simple ideas which we receive from sensation and reflection. For observing in ourselves, that we can, at pleasure, move several parts of our bodies which were at rest; the effects, also, that natural bodies are able to produce in one another, occurring every moment to our senses, we both these ways get the idea of power.

§ 9. *Succession.*—Besides these, there is another idea, which though suggested by our senses, yet is more constantly offered to us by what passes in our minds; and that is the idea of succession. For if we look immediately into ourselves, and reflect on what is observable there, we shall find our ideas always whilst we are awake, or have any thought, passing in train, one going, and another coming, without intermission.

§ 10. *Simple ideas the materials of all our knowledge.*—These, if they are not all, are, at least (as I think), the most considerable of those simple ideas which the mind has, and out of which is made all its other knowledge; all which it receives only by the two fore-mentioned ways of sensation and reflection.

Nor let any one think these too narrow bounds for the capacious mind of man to expatiate in, which takes its flight farther than the stars, and cannot be confined by the limits of the world; that extends its thoughts often, even beyond the utmost expansion of matter; and makes excursions into that incomprehensible inane. I grant all this, but desire any one to assign any simple idea, which is not received from one of those inlets before-mentioned, or any complex idea not made out of those simple ones. Nor will it be so strange to think these few simple ideas sufficient to employ the quickest thought, or largest capacity; and to furnish the materials of all that various knowledge, and more various fancies and opinions of all mankind, if we consider how many words may be made out of the various composition of twenty-four letters; or if, going one step farther, we will but reflect on the variety of combinations that may be made with barely one of the above-mentioned ideas, viz. number, whose stock is inexhaustible, and truly infinite: and what a large and immense field doth extension alone afford the mathematicians?

CHAP. VIII.

SOME FARTHER CONSIDERATIONS CONCERNING OUR SIMPLE IDEAS.

§ 1. *Positive ideas from privative causes.*—Concerning the simple idea of sensation, it is to be considered, that whatsoever is so constituted in nature, as to be able, by affecting our senses, to cause any

perception in the mind, doth hereby produce in the understanding a simple idea; which, whatever be the external cause of it, when it comes to be taken notice of by our discerning faculty, it is by the mind looked on and considered there, to be a real positive idea in the understanding, as much as any other whatsoever; though, perhaps, the cause of it be but a privation of the subject.

§ 2. Thus the ideas of heat and cold, light and darkness, white and black, motion and rest, are equally clear and positive ideas in the mind; though, perhaps, some of the causes which produce them, are barely privations in those subjects from whence our senses derive those ideas. These the understanding, in its view of them, considers all as distinct positive ideas, without taking notice of the causes that produce them; which is an inquiry not belonging to the idea, as it is in the understanding, but to the nature of the things existing without us. These are two very different things, and carefully to be distinguished; it being one thing to perceive and know the idea of white or black; and quite another to examine what kind of particles they must be, and how ranged in the superficies, to make any object appear white or black.

§ 3. A painter, or dyer, who never inquired into their causes, hath the ideas of white and black, and other colours, as clearly, perfectly, and distinctly in his understanding, and, perhaps, more distinctly, than the philosopher, who had busied himself in considering their natures, and thinks he knows how far either of them is in its cause positive, or privative; and the idea of black is no less positive in his mind, than that of white, however the cause of that colour, in the external object, may be only a privation.

§ 4. If it were the design of my present undertaking to inquire into the natural causes and manner of perception, I should offer this as a reason, why a privative cause might, in some cases at least, produce a positive idea; viz., that all sensation being produced in us, only by different degrees and modes of motion in our animal spirits, variously agitated by external objects, the abatement of any former motion must necessarily produce a new sensation, as the variation or increase of it; and so introduce a new idea, which depends only on a different notion of the animal spirits in that organ.

§ 5. But whether this be so, or no, I will not here determine, but appeal to every one's own experience, whether the shadow of a man, though it consists of nothing but the absence of light (and the more the absence of light is, the more discernible is the shadow), does not, when a man looks on it, cause as clear and positive idea in his mind, as a man himself, though covered over with a clear sun-shine? and the picture of a shadow is a positive thing. Indeed, we have negative names, which stand not directly for positive ideas, but for their absence, such as insipid, silence, nihil, &c., which words denote positive ideas; as taste, sound, being, with a signification of their absence.

§ 6. *Positive ideas from privative causes.*—And thus one may truly be said to see darkness. For supposing a hole, perfectly dark, from whence no light is reflected, it is certain one may see the figure of it, or may be painted: or whether the ink I write with makes any other idea, is a question. The privative causes I have here assigned of posi-

tive ideas, are according to the common opinion; but, in truth, it will be hard to determine, whether there be really any ideas from a privative cause? till it be determined, “whether rest be any more a privation than motion?”

§ 7. *Ideas in the mind, qualities in bodies.*—To discover the nature of our ideas the better, and to discourse of them intelligibly, it will be convenient to distinguish them, as they are ideas or perceptions in our minds; and as they are modifications of matter in the bodies that cause such perceptions in us; that so we may not think (as perhaps usually is done) that they are exactly the images and resemblances of something inherent in the subject; most of those of sensation being in the mind no more the likeness of something existing without us, than the names that stand for them are the likeness of our ideas, which yet, upon hearing, they are apt to excite in us.

§ 8. Whatsoever the mind perceives in itself, or is the immediate object of perception, thought, or understanding, that I call idea; and the power to produce any idea in our mind, I call quality of the subject wherein that power is. Thus a snow-ball having the power to produce in us the idea of white, cold, and round, the powers to produce those ideas in us, as they are in the snow-ball, I call qualities; and as they are sensations or perceptions in our understandings, I call them ideas; which ideas, if I speak of them sometimes, as in the things themselves, I would be understood to mean those qualities in the objects which produce them in us.

§ 9. *Primary qualities.*—Qualities thus considered in bodies, are, *First*, such as are utterly inseparable from the body, in what estate soever it be; such as, in all the alterations and changes it suffers, all the force can be used upon it, it constantly keeps; and such as sense constantly finds in every particle of matter, which has bulk enough to be perceived, and the mind finds inseparable from every particle of matter, though less than to make itself singly be perceived by our senses, v. g. take a grain of wheat, divide it into two parts, each part has still solidity, extension, figure, and mobility; divide it again, and it retains still the same qualities; and so divide it on, till the parts become insensible, they must retain still each of them all those qualities. For division (which is all that a mill, or pestle, or any other body, does upon another, in reducing it to insensible parts) can never take away either solidity, extension, figure, or mobility, from any body, but only makes two or more distinct, separate masses of matter, of that which was but one before; all which distinct masses, reckoned as so many distinct bodies, after division, make a certain number. These I call original or primary qualities of body, which, I think, we may observe to produce simple ideas in us, viz. solidity, extension, figure, motion or rest, and number.

§ 10. *Secondary qualities.*—*Secondly*, Such qualities, which, in truth, are nothing in the objects themselves, but powers to produce various sensations in us by their primary qualities, i. e. by the bulk, figure, texture, and motion of their insensible parts, as colours, sound, tastes, &c., these I call secondary qualities. To these might be added a third sort, which are allowed to be barely powers, though

they are as much real qualities in the subject, as those which I, to comply with the common way of speaking, call qualities, but for distinction, secondary qualities. For the power in fire to produce a new colour or consistency in wax, or clay, by its primary qualities, is as much a quality in fire, as the power it has to produce in me a new idea or sensation of warmth or burning, which I felt not before, by the same primary qualities, viz. the bulk, texture, and motion of its insensible parts.

§ 11. *How primary qualities produce their ideas.*—The next thing to be considered is, how bodies produce ideas in us; and that is manifestly by impulse, the only way which we can conceive bodies to operate in.

§ 12. If then external objects be not united to our minds, when they produce ideas therein, and yet we perceive these original qualities in such of them as singly fall under our senses, it is evident that some motion must be thence continued by our nerves or animal spirits, by some parts of our bodies, to the brain, or the seat of sensation, there to produce in our minds the particular ideas we have of them. And since the extension, figure, number, and motion of bodies of an observable bigness, may be perceived at a distance by the sight, it is evident some singly imperceptible bodies must come from them to the eyes, and thereby convey to the brain some motion, which produces these ideas which we have of them in us.

§ 13. *How secondary.*—After the same manner that the ideas of these original qualities are produced in us, we may conceive that the ideas of secondary qualities, are also produced, viz. by the operation of insensible particles on our senses. For it being manifest that there are bodies, and good store of bodies, each whereof are so small, that we cannot, by any of our senses, discover either their bulk, figure, or motion, as is evident in the particles of the air and water, and others extremely smaller than those, perhaps as much smaller than the particles of air and water, as the particles of air and water are smaller than peas or hail-stones. Let us suppose at present, that the different motions, and figures, bulk and number, of such particles, affecting the several organs of our senses, produce in us those different sensations, which we have from the colours and smells of bodies, v. g. that a violet by the impulse of such insensible particles of matter of peculiar figures and bulks, and in different degrees and modifications of their motions, causes the ideas of the blue colour, and sweet scent, of that flower, to be produced in our minds; it being no more impossible to conceive that God should annex such ideas to such motions, with which they have no similitude, than that he should annex the idea of pain to the motion of a piece of steel dividing our flesh, with which that idea hath no resemblance.

§ 14. What I have said concerning colours and smells, may be understood also of tastes and sounds, and other the like sensible qualities; which, whatever reality we, by mistake, attribute to them, are, in truth, nothing in the objects themselves, but powers to produce various sensations in us, and depend on those primary qualities, viz. bulk, figure, texture, and motion of parts; as I have said.

§ 15. *Ideas of primary qualities are resemblances; of secondary, not.*—From whence I think it is easy to draw this observation, that the ideas of primary qualities of bodies, are resemblances of them, and their patterns do really exist in the bodies themselves; but the ideas produced in us by these secondary qualities, have no resemblance of them at all. There is nothing like our ideas existing in the bodies themselves. They are in the bodies we denominate from them, only a power to produce those sensations in us: and what is sweet, blue, or warm, in idea, is but the certain bulk, figure, and motion of the insensible parts in the bodies themselves, which we call so.

§ 16. Flame is denominated hot and light; snow, white and cold; and manna, white and sweet, from the ideas they produce in us; which qualities are commonly thought to be the same in those bodies, that those ideas are in us, the one the perfect resemblance of the other, as they are in a mirror; and it would by most men be judged very extravagant, if one should say otherwise. And yet he that will consider, that the same fire, that at one distance produces in us the sensation of warmth, does, at a nearer approach, produce in us the far different sensation of pain, ought to bethink himself, what reason he has to say, that his idea of warmth, which was produced in him by the fire, is actually in the fire; and his idea of pain, which the same fire produced in him the same way, is not in the fire. Why are whiteness and coldness in snow, and pain not, when it produces the one and the other idea in us; and can do neither, but by the bulk, figure, number, and motion of its solid parts?

§ 17. The particular bulk, number, figure, and motion of the parts of fire, or snow, are really in them, whether any one's senses perceive them or no; and therefore, they may be called real qualities, because they really exist in those bodies. But light, heat, whiteness, or coldness, are no more really in them, than sickness or pain is in manna. Take away the sensation of them; let not the eyes see light or colours, nor the ears hear sounds; let the palate not taste, nor the nose smell; and all colours, tastes, odours, and sounds, as they are such particular ideas, vanish and cease, and are reduced to their causes, i. e. bulk, figure, and motion of parts.

§ 18. A piece of manna of a sensible bulk, is able to produce in us the idea of a round or square figure: and by being removed from one place to another, the idea of motion. This idea of motion represents it, as it really is, in the manna moving: a circle or square are the same, whether in idea or existence, in the mind, or in the manna: and this, both motion and figure, are really in the manna, whether we take notice of them, or no: this every body is ready to agree to. Besides, manna, by the bulk, figure, texture, and motion of its parts, has a power to produce the sensations of sickness and sometimes of acute pains or gripings in us. That these ideas of sickness and pain, are not in the manna, but effects of its operations on us, and are nowhere when we feel them not: this also every one readily agrees to. And yet men are hardly to be brought to think, that sweetness and whiteness are not really in manna; which are but the effects of the operations of manna by the motion, size, and figure of its particles on the eyes and palate.

as the pain and sickness caused by manna, are confessedly nothing but the effects of its operations on the stomach and guts, by the size, motion, and figure of its insensible parts; (for by nothing else can a body operate, as has been proved) as if it could not operate on the eyes and palate, and thereby produce in the mind particular distinct ideas, which in itself it has not, as well as we allow it can operate on the guts and stomach, and thereby produce distinct ideas, which in itself it has not. These ideas being all effects of the operations of manna, on several parts of our bodies, by the size, figure, number, and motion of its parts, why those produced by the eyes and palate, should rather be thought to be really in the manna, than those produced by the stomach and guts; or why the pain and sickness, ideas that are the effects of manna, should be thought to be nowhere, when they are not felt; and yet the sweetness and whiteness, effects of the same manna, on other parts of the body, by ways equally as unknown, should be thought to exist in the manna, when they are not seen nor tasted, would need some reason to explain.

§ 19. *Ideas of primary qualities, are resemblances; of secondary, not.*—Let us consider the red and white colours in porphyry: hinder light but from striking on it, and its colours vanish; it no longer produces any such ideas in us. Upon the return of light, it produces these appearances on us again. Can any one think any real alterations are made in the porphyry, by the presence or absence of light; and that those ideas of whiteness and redness, are really in porphyry in the light, when it is plain it has no colour in the dark? It has, indeed, such a configuration of particles, both night and day, as are apt, by the rays of light rebounding from some parts of that hard stone, to produce in us the idea of redness, and from others, the idea of whiteness: but whiteness or redness are not in it at any time, but such a texture that hath the power to produce such a sensation in us.

§ 20. Pound an almond, and the clear white colour will be altered into a dirty one, and the sweet taste, into an oily one. What real alteration can the beating of the pestle make in any body, but an alteration of the texture of it?

§ 21. Ideas being thus distinguished and understood, we may be able to give an account how the same water, at the same time, may produce the idea of cold by one hand, and of heat by the other: whereas it is impossible, that the same water, if those ideas were really in it, should, at the same time, be both hot and cold. For if we imagine warmth, as it is in our hands, to be nothing but a certain sort and degree of motion in the minute particles of our nerves, or animal spirits, we may understand how it is possible, that the same water may, at the same time, produce the sensations of heat in one hand, and cold in the other; which yet figure never does, that never producing the idea of a square by one hand, which has produced the idea of a globe by another. But if the sensation of heat and cold be nothing but the increase or diminution of the motion of the minute parts of our bodies, caused by the corpuscles of any other body, it is easy to be understood, that if that notion be greater in one hand than in the other; if a body be applied to the two hands, which has in its minute particles a greater motion than those of one of the hands, and a less than in those of the other, it will

increase the motion of the one hand, and lessen it in the other, and so cause the different sensations of heat and cold that depend thereon.

§ 22. I have, in what just goes before, been engaged in physical inquiries a little farther than perhaps I intended. But it being necessary to make the nature of sensation a little understood, and to make the difference between the qualities in bodies, and the ideas produced by them in the mind, to be distinctly conceived, without which it were impossible to discourse intelligibly of them; I hope I shall be pardoned this little excursion into natural philosophy, it being necessary in our present inquiry, to distinguish the primary and real qualities of bodies which are always in them, (viz. solidity, extension, figure, number, and motion or rest; and are sometimes perceived by us, viz. when the bodies they are in, are big enough singly to be discerned from those secondary and imputed qualities, which are but the powers of several combinations of those primary ones, when they operate without being distinctly discerned) whereby we also may come to know what ideas are, and what are not resemblances of something really existing in the bodies we denominate from them.

§ 23. *Three sorts of qualities in bodies.*—The qualities, then, that are in bodies, rightly considered, are of three sorts.

First, The bulk, figure, number, situation, and motion or rest of their solid parts; those are in them, whether we perceive them or no; and when they are of that size, that we can discover them, we have by these an idea of the thing, as it is in itself; as is plain in artificial things. These I call primary qualities.

Secondly, The power that is in any body, by reason of its insensible primary qualities, to operate after a peculiar manner on any of our senses, and thereby produce in us the different ideas of several colours, sounds, smells, tastes, &c. These are usually called sensible qualities.

Thirdly, The power that is in any body by reason of the particular constitution of its primary qualities, to make such a change in the bulk figure, texture, and motion of another body, as to make it operate on our senses, differently from what it did before. Thus the sun has a power to make wax white; and fire, to make lead fluid. These are usually called powers.

The first of these, as has been said, I think, may be properly called real, original, or primary qualities, because they are in the things themselves, whether they are perceived or no; and upon their different modifications it is that the secondary qualities depend.

The other two are only powers to act differently upon other things, which powers result from the different modifications of those primary qualities.

§ 24. *The first are resemblances. The second thought resemblances, but are not. The third neither are, nor are thought so.*—But though the two latter sorts of qualities are powers barely, and nothing but powers relating to several other bodies, and resulting from the different modifications of the original qualities; yet they are generally otherwise thought of. For the second sort, viz. the powers to produce several ideas in us by our senses, are looked upon as real qualities in the things thus affecting us: but the third sort are called and esteemed barely powers.

v. g. the idea of heat or light, which we receive by our eyes, or touch, from the sun, are commonly thought real qualities, existing in the sun, and something more than mere powers in it. But when we consider the sun, in reference to wax, which it melts or blanches, we look upon the whiteness and softness produced in the wax, not as qualities in the sun, but effects produced by powers in it: whereas, if rightly considered, these qualities of light and warmth, which are perceptions in me when I am warmed or enlightened by the sun, are no otherwise in the sun, than the changes made in the wax, when it is blanched or melted, are in the sun: they are all of them equally powers in the sun, depending on its primary qualities; whereby it is able, in the one case, so to alter the bulk, figure, texture, or motion of some of the insensible parts of my eyes or hands, as thereby to produce in me the idea of light or heat; and in the other, it is able so to alter the bulk, figure, texture, or motion of the insensible parts of the wax, as to make them fit to produce in me the distinct ideas of white and fluid.

§ 25. The reason, “why the one are ordinarily taken for real qualities, and the other only for bare powers,” seems to be, because the ideas we have of distinct colours, sounds, &c. containing nothing at all in them of bulk, figure, or motion, we are not apt to think them the effects of these primary qualities, which appear not to our senses, to operate in their production; and with which they have not any apparent congruity, or conceivable connexion. Hence it is, that we are so forward to imagine, that those ideas are the resemblances of something really existing in the objects themselves: since sensation discovers nothing of bulk, figure, or motion of parts in their production; nor can reason shew how bodies, by their bulk, figure, and motion, should produce in the mind the ideas of blue or yellow, &c. But in the other case, in the operations of bodies changing the qualities one of another, we plainly discover that the quality produced hath commonly no resemblance with any thing in the thing producing it; wherefore we look on it as a bare effect of power. For though receiving the idea of heat or light from the sun, we are apt to think it is a perception and resemblance of such a quality in the sun; yet when we see wax or a fair face, receive change of colour from the sun, we cannot imagine that to be the reception or resemblance of any thing in the sun, because we find not those different colours in the sun itself. For our senses being able to observe a likeness or unlikeness of sensible qualities in two different external objects, we forwardly enough conclude the production of any sensible quality in any subject, to be an effect of bare power, and not the communication of any quality which was really in the efficient, when we find no such sensible quality in the thing that produced it. But our senses not being able to discover any unlikeness between the idea produced in us and the quality of the object producing it, we are apt to imagine that our ideas are resemblances of something in the objects, and not the effects of certain powers, placed in the modification of their primary qualities, with which primary qualities the ideas produced in us have no resemblance.

§ 26. *Secondary qualities two-fold; first, immediately perceivable;*

secondly, mediately perceivable.—To conclude: beside those before-mentioned primary qualities in bodies, viz. bulk, figure, extension, number, and motion of their solid parts; all the rest, whereby we take notice of bodies, and distinguish them from one another, are nothing else but several powers in them, depending on those primary qualities; whereby they are fitted, either by immediately operating on our bodies, to produce several different ideas in us; or else by operating on other bodies, so to change their primary qualities, as to render them capable of producing ideas in us, different from what before they did. The former of these, I think, may be called secondary qualities, immediately perceivable: the latter, secondary qualities, mediately perceivable.

CHAP. IX.

OF PERCEPTION.

§ 1. *It is the first simple idea of reflection.*—Perception, as it is the first faculty of the mind, exercised about our ideas; so it is the first and simplest idea we have from reflection, and it is by some called thinking in general. Though thinking, in the propriety of the English tongue, signifies that sort of operation in the mind about its ideas, wherein the mind is active; where it, with some degree of voluntary attention, considers any thing. For in bare naked perception, the mind is, for the most part, only passive; and what it perceives, it cannot avoid perceiving.

§ 2. *Perception is only when the mind receives the impression.*—What perception is, every one will know better by reflecting on what he does himself, what he sees, hears, feels, &c., or thinks, than by any discourse of mine. Whoever reflects on what passes in his own mind, cannot miss it: and if he does not reflect, all the words in the world cannot make him have any notion of it.

§ 3. This is certain, that whatever alterations are made in the body, if they reach not the mind; whatever impressions are made on the outward parts, if they are not taken notice of within, there is no perception. Fire may burn our bodies with no other effect than it does a billet, unless the motion be continued to the brain, and there the sense of heat, or idea of pain, be produced in the mind, wherein consists actual perception.

§ 4. How often may a man observe in himself, that whilst his mind is intently employed in the contemplation of some objects, and curiously surveying some ideas that are there, it takes no notice of impressions of sounding bodies, made upon the organ of hearing, with the same alteration that uses to be for the producing the idea of sound? A sufficient impulse there may be on the organ; but it not reaching the observation of the mind, there follows no perception: and though the motion that uses to produce the idea of sound, be made in the ear, yet no sound is heard. Want of sensation, in this case, is not through any defect in the organ, or that the man's ears are less affected than at other times, when he does hear: but that which uses to produce the idea, though conveyed in by the usual organ, not being taken notice

of in the understanding, and so imprinting no idea in the mind, there follows no sensation. So that wherever there is sense, or perception, there some idea is actually produced, and present, in the understanding.

§ 5. *Children, though they have ideas in the womb, have none innate.*—Therefore, I doubt not but children, by the exercise of their senses about objects that affect them in the womb, receive some few ideas before they are born, as the unavoidable effects either of the bodies that environ them, or else of those wants or diseases they suffer, amongst which (if one may conjecture concerning things not very capable of examination) I think the ideas of hunger and warmth, are two; which probably, are some of the first that children have, and which they scarce ever part with again.

§ 6. But though it be reasonable to imagine that children receive some ideas before they come into the world, yet those simple ideas are far from those innate principles which some contend for, and we, above, have rejected. These, here mentioned, being the effects of sensation, are only from some affections of the body, which happen to them there, and so depend on something exterior to the mind; no otherwise differing in their manner of production from other ideas derived from sense, but only in the precedency of time; whereas, those innate principles are supposed to be quite of another nature; not coming into the mind by any accidental alterations in, or operations on, the body; but, as it were, original characters impressed upon it in the very first moment of its being and constitution.

§ 7. *Which ideas first, is not evident.*—As there are some ideas, which we may reasonably suppose may be introduced into the minds of children in the womb, subservient to the necessities of their life and being there; so, after they are born, those ideas are the earliest imprinted which happen to be the sensible qualities which first occur to them; amongst which, light is not the least considerable, nor of the weakest efficacy. And how covetous the mind is, to be furnished with all such ideas as have no pain accompanying them, may be a little guessed, by what is observable in children new born, who always turn their eyes to that part from whence the light comes, lay them how you please. But the ideas that are most familiar at first, being various, according to the divers circumstances of children's first entertainment in the world, the order wherein the several ideas come at first into the mind, is very various, and uncertain also; neither is it much material to know it.

§ 8. *Ideas of sensation often changed by the judgment.*—We are farther to consider concerning perception, that the ideas we receive by sensation are often, in grown people, altered by the judgment, without our taking notice of it. When we set before our eyes a round globe of any uniform colour, v. g., gold, alabaster, or jet, it is certain that the idea thereby imprinted in our mind, is of a flat circle, variously shadowed with several degrees of light and brightness coming to our eyes. But we having, by use, been accustomed to perceive what kind of appearance convex bodies are wont to make in us; what alterations are made in the reflections of light, by the difference of the sensible figures of bodies, the judgment presently, by an habitual custom, alters the appear-

ances into their causes ; so that from that, which is truly variety of shadow or colour, collecting the figure, it makes it pass for a mark or figure, and frames to itself the perception of a convex figure, and a uniform colour ; when the idea we receive from thence, is only a plane, variously coloured ; as is evident in painting. To which purpose I shall here insert a problem of that very ingenious and studious promoter of real knowledge, the learned and worthy Mr. Molineux, which he was pleased to send me in a letter some months since ; and it is this : “ Suppose a man born blind, and now adult, and taught by his touch to distinguish between a cube and a sphere of the same metal, and nighly of the same bigness, so as to tell, when he felt one and the other, which is the cube, which the sphere. Suppose then the cube and sphere placed on a table, and the blind made to see ; query, Whether by his sight, before he touched them, he could now distinguish, and tell, which is the globe, which the cube ? ” To which the acute and judicious proposer answers : “ Not. For though he has obtained the experience of, how a globe, how a cube, affects his touch ; yet he has not yet attained the experience, that what affects his touch so or so, must affect his sight so or so ; or that a protuberant angle in the cube, that pressed his hand unequally, shall appear to his eye as it does in the cube.” I agree with this thinking gentleman, whom I am proud to call my friend, in his answer to this his problem ; and am of opinion, that the blind man, at first sight, would not be able, with certainty, to say which was the globe, which the cube, whilst he only saw them ; though he could, unerringly, name them by his touch, and certainly distinguish them by the difference of their figures felt. This I have set down, and leave with my reader, as an occasion for him to consider, how much he may be beholden to experience, improvement, and acquired notions, where he thinks he had not the least use of, or help from, them : and the rather, because this observing gentleman farther adds, that having, upon the occasion of my book, proposed this to divers very ingenious men, he hardly ever met with one, than at first gave the answer to it, which he thinks true, till, by hearing his reasons, they were convinced.

§ 9. But this is not, I think, usual in any of our ideas, but those received by sight ; because sight, the most comprehensive of all our senses, conveying to our minds the ideas of light and colours, which are peculiar only to that sense ; and also the far different ideas of space, figure, or motion, the several varieties whereof change the appearances of its proper object, viz., light and colours ; we bring ourselves, by use, to judge of the one by the other. This, in many cases, by a settled habit in things whereof we have frequent experience, is performed so constantly, and so quick, that we take that for the perception of our sensation, which is an idea formed by our judgment ; so that one, viz., that of sensation, serves only to excite the other, and is scarce taken notice of itself : as a man who reads or hears with attention and understanding, takes little notice of the characters or sounds, but of the ideas, that are excited in him by them.

§ 10. Nor need we wonder that this is done with so little notice, if we consider how very quick the actions of the mind are performed ; for as itself is thought to take up no space, to have no extension ; so

its actions seem to require no time, but many of them seem to be crowded into an instant. I speak this in comparison to the actions of the body. Any one may easily observe this in his own thoughts, who will take the pains to reflect on them. How, as it were in an instant, do our minds, with one glance, see all the parts of a demonstration, which may very well be called a long one, if we consider the time it will require to put it into words, and step by step shew it another? *Secondly*, we shall not be so much surprised that this is done in us with so little notice, if we consider how the facility which we get of doing things, by a custom of doing, makes them often pass in us without our notice. Habits, especially such as are begun very early, come, at last, to produce actions in us, which often escape our observation. How frequently do we, in a day, cover our eyes with our eye-lids, without perceiving that we are at all in the dark? Men, that by custom have got the use of a by-word, do almost in every sentence, pronounce sounds, which though taken notice of by others, they themselves neither hear nor observe. And, therefore, it is not so strange that our mind should often change the idea of its sensation into that of its judgment, and make one serve only to excite the other, without our taking notice of it.

§ 11. *Perception puts the difference between animals and inferior beings.*—This faculty of perception seems to me to be that which puts the distinction betwixt the animal kingdom, and the inferior parts of nature. For however vegetables have, many of them, some degrees of motion, and upon the different application of other bodies to them, do very briskly alter their figures and motions, and so have obtained the name of sensitive plants, from a motion, which has some resemblance to that which in animals follows upon sensation; yet, I suppose, it is all bare mechanism: and no otherwise produced than the turning of a wild oat beard, by the insinuation of the particles of moisture; or the shortening of a rope, by the affusion of water. All which is done without any sensation in the subject, or the having or receiving any ideas.

§ 12. Perception, I believe, is, in some degree, in all sorts of animals; though in some, possibly, the avenues provided by nature for the reception of sensations, are so few, and the perception they are received with, so obscure and dull, that it comes extremely short of the quickness and variety of sensation which are in other animals; but yet it is sufficient for, and wisely adapted to, the state and condition of that sort of animals who are thus made: so that the wisdom and goodness of the Maker plainly appears in all the parts of this stupendous fabric, and all the several degrees and ranks of creatures in it.

§ 13. We may, I think, from the make of an oyster or cockle, reasonably conclude that it has not so many, nor so quick, senses as a man, or several other animals; nor, if it had, would it, in that state of incapacity of transferring itself from one place to another, be bettered by them. What good would sight and hearing do to a creature, that cannot move itself to or from the objects, wherein, at a distance, it perceives good or evil? And would not quickness of sensation be an inconvenience to an animal that must lie still where chance has once

placed it ; and there receive the afflux of colder or warmer, clean or foul, water, as it happens to come to it.

§ 14. But yet I cannot but think, there is some small dull perception, whereby they are distinguished from perfect insensibility. And that this may be so, we have plain instances, even in mankind itself. Take one in whom decrepit old age has blotted out the memory of his past knowledge, and clearly wiped out the ideas his mind was formerly stored with ; and has, by destroying his sight, hearing, and smell quite, and his taste to a great degree, stopped up almost all the passages for new ones to enter ; or, if there be some of the inlets yet half open, the impressions made are scarce perceived, or not at all retained. How far such a one (notwithstanding all that is boasted of innate principles) is in his knowledge and intellectual faculties, above the condition of a cockle, or an oyster, I leave to be considered. And if a man passed sixty years in such a state, as it is possible he might, as well as three days, I wonder what difference there would have been in any intellectual perfections, between him and the lowest degree of animals.

§ 15. *Perception the inlet of knowledge.*—Perception then being the first step and degree towards knowledge, and the inlet of all the materials of it, the fewer senses any man, as well as any other creature, hath ; and the fewer, and duller the impressions are, that are made by them, and the duller faculties are, that are employed about them, the more remote are they from that knowledge which is to be found in some men. But this being in great variety of degrees (as may be perceived amongst men), cannot certainly be discovered in the several species of animals, much less in their particular individuals. It suffices me only to have remarked here, that perception is the first operation of all our intellectual faculties, and the inlet of all knowledge in our minds. And I am apt too, to imagine, that it is perception, in the lowest degree of it, which puts the boundaries between animals and the inferior ranks of creatures. But this I mention only as my conjecture, by the by, it being indifferent to the matter in hand, which way the learned shall determine of it.

CHAP. X.

OF RETENTION.

§ 1. *Contemplation.*—The next faculty of the mind, whereby it makes a farther progress towards knowledge, is that which I call retention, or the keeping of those simple ideas, which, from sensation or reflection, it hath received. This is done two ways : first, by keeping the idea, which is brought into it, for some time actually in view, which is called contemplation.

§ 2. *Memory.*—The other way of retention, is the power to revive again in our minds those ideas, which, after imprinting, have disappeared, or have been, as it were, laid aside out of sight ; and that we do, when we conceive heat or light, yellow or sweet, the object being removed. This is memory, which is, as it were, the storehouse of our ideas. For the narrow mind of man, not being capable of having many

ideas under view and consideration at once, it was necessary to have a repository, to lay up those ideas, which, at another time, it might have use of. But our ideas being nothing but actual perceptions in the mind, which cease to be any thing, when there is no perception of them, this laying up of our ideas in the repository of the memory, signifies no more than this, that the mind has a power, in many cases, to revive perceptions which it has once had, with this additional perception annexed to them, that it has had them before. And in this sense it is, that our ideas are said to be in our memories, when, indeed, they are actually no where, but only there is an ability in the mind, when it will, to revive them again, and, as it were, paint them anew on itself, though some with more, some with less difficulty; some more lively, and others more obscurely. And thus it is, by the assistance of this faculty, that we are to have all those ideas in our understandings, which though we do not actually contemplate, yet we can bring in sight, and make appear again, and be the objects of our thoughts, without the help of those sensible qualities which first imprinted them there.

§ 3. *Attention, repetition, pleasure, and pain, fix ideas.*—Attention and repetition help much to the fixing any ideas in the memory; but those which naturally at first make the deepest and most lasting impressions, are those which are accompanied with pleasure or pain. The great business of the senses being to make us take notice of what hurts or advantages the body, it is wisely ordered by nature (as has been shewn) that pain should accompany the reception of several ideas; which, supplying the place of consideration and reasoning in children, and acting quicker than consideration in grown men, makes both the young and old avoid painful objects with that haste which is necessary for their preservation; and, in both, settles in the memory, a caution for the future.

§ 4. *Ideas fade in the memory.*—Concerning the several degrees of lasting, wherewith ideas are imprinted on the memory, we may observe, that some of them have been produced in the understanding, by an object affecting the senses once only, and no more than once; others, that have more than once offered themselves to the senses, have yet been little taken notice of; the mind, either heedless as in children, or otherwise employed, as in men, intent only on one thing, not setting the stamp deep into itself. And in some, where they are set on with care and repeated impressions, either through the temper of the body, or some other fault, the memory is very weak; in all these cases, ideas in the mind quickly fade, and often vanish quite out of the understanding, leaving no more footsteps, or remaining characters of themselves, than shadows do flying over fields of corn; and the mind is as void of them, as if they had never been there.

§ 5. Thus, many of those ideas which were produced in the minds of children, in the beginning of their sensation (some of which, perhaps, as of some pleasures and pains, were before they were born, and others in their infancy), if, in the future course of their lives, they are not repeated again, are quite lost, without the least glimpse remaining of them. This may be observed in those, who, by some mischance, have lost their sight when they were very young, in whom the ideas of

colours, having been but slightly taken notice of, and ceasing to be repeated, do quite wear out; so that some years after, there is no more notion nor memory of colours left in their minds, than in those of people born blind. The memory of some men, it is true, is very tenacious, even to a miracle; but yet there seems to be a constant decay of all our ideas, even of those which are struck deepest, and in minds the most retentive; so that if they be not sometimes renewed by repeated exercise of the senses, or reflection on those kind of objects which, at first, occasioned them, the print wears out, and, at last, there remains nothing to be seen. Thus the ideas, as well as children of our youth, often die before us: and our minds represent to us those tombs to which we are approaching; where, though the brass and marble remain, yet the inscriptions are effaced by time, and the imagery moulders away. The pictures drawn in our minds are laid in fading colours; and if not sometimes refreshed, vanish and disappear. How much the constitution of our bodies, and the make of our animal spirits, are concerned in this, and whether the temper of the brain make this difference, that in some it retains the characters drawn on it like marble; in others like freestone; and in others, little better than sand, I shall not here inquire: though it may seem probable, that the constitution of the body does sometimes influence the memory; since we oftentimes find a disease quite strip the mind of all its ideas, and the flames of a fever, in a few days, calcine all those images to dust and confusion, which seemed to be as lasting, as if graved in marble.

§ 6. *Constantly repeated ideas can scarce be lost.*—But concerning the ideas themselves, it is easy to remark, that those that are oftenest refreshed (amongst which are those that are conveyed into the mind by more ways than one) by a frequent return of the objects or actions that produced them, fix themselves best in the memory, and remain clearest and longest there; and, therefore, those which are of the original qualities of bodies, viz., solidity, extension, figure, motion, and rest; and those that almost constantly affect our bodies, as heat and cold; and those which are the affections of all kinds of beings, as existence, duration, and number, which almost every object that affects our senses, every thought which employs our minds, bring along with them; these, I say, and the like ideas, are seldom quite lost, while the mind retains any ideas at all.

§ 7. *In remembering, the mind is often active.*—In this secondary perception, as I may so call it, or viewing again the ideas that are lodged in the memory, the mind is oftentimes more than barely passive, the appearance of those dormant pictures depending sometimes on the will. The mind very often sets itself on work in search of some hidden idea, and turns, as it were, the eye of the soul upon it; though sometimes too they start up in our minds of their own accord, and offer themselves to the understanding; and very often are roused and tumbled out of their dark cells, into open day-light, by turbulent and tempestuous passion; our affections bringing ideas to our memory, which had otherwise lain quiet and unregarded. This farther is to be observed, concerning ideas lodged in the memory, and upon occasion revived by the mind, that they are not only (as the word revive imports) none of

them new ones ; but also that the mind takes notice of them, as of a former impression, and renews its acquaintance with them, as with ideas it had known before. So that though ideas formerly imprinted, are not all constantly in view, yet in remembrance they are constantly known to be such as have been formerly imprinted, i. e. in view, and taken notice of before by the understanding.

§ 8. *Two defects in the memory, oblivion and slowness.*—Memory, in an intellectual creature, is necessary in the next degree to perception. It is of so great moment, that where it is wanting, all the rest of our faculties are in a great measure useless ; and we, in our thoughts, reasonings, and knowledge, could not proceed beyond present objects, were it not for the assistance of our memories, wherein there may be two defects.

First, That it loses the idea quite, and so far it produces perfect ignorance. For since we can know nothing farther than we have the idea of it, when that is gone we are in perfect ignorance.

Secondly, That it moves slowly, and retrieves not the ideas that it has, and are laid up in store, quick enough to serve the mind upon occasion. This, if it be to a great degree, is stupidity : and he, who through this default in his memory, has not the ideas that are really preserved there ready at hand, when need and occasion calls for them, were almost as good be without them quite, since they serve him to little purpose. The dull man, who loses the opportunity, while he is seeking in his mind for those ideas that should serve his turn, is not much more happy in his knowledge than one that is perfectly ignorant. It is the business, therefore, of the memory to furnish the mind with those dormant ideas which it has present occasion for ; in the having them ready at hand, on all occasions, consists that which we call invention, fancy, and quickness of parts.

§ 9. These are defects we may observe in the memory of one man compared with another. There is another defect which we may conceive to be in the memory of man in general, compared with some superior created intellectual beings, which in this faculty may so far excel man, that they may have constantly in view the whole scene of all their former actions, wherein no one of the thoughts they have ever had, may slip out of their sight. The Omniscience of God, who knows all things, past, present, and to come, and to whom the thoughts of men's hearts always lie open, may satisfy us of the possibility of this. For who can doubt, but God may communicate to those glorious spirits, his immediate attendants, any of his perfections, in what proportion he pleases, as far as created finite beings can be capable ? It is reported of that prodigy of parts, Monsieur Pascal, that till the decay of his health had impaired his memory, he forgot nothing of what he had done, read, or thought, in any part of his rational age. This is a privilege so little known to most men, that it seems almost incredible to those, who, after the ordinary way, measure all others by themselves : but yet, when considered, may help us to enlarge our thoughts towards greater perfection of it in superior ranks of spirits. For this of M. Pascal, was still with the narrowness that human minds are confined to here, of having great variety of ideas only by succession, not all at once :

whereas the several degrees of angels may probably have larger views, and some of them be endowed with capacities able to retain together, and constantly set before them, as in one picture, all their past knowledge at once. This, we may conceive, would be no small advantage to the knowledge of a thinking man; if all his past thoughts and reasonings could be always present to him. And, therefore, we may suppose it one of those ways, wherein the knowledge of separate spirits may exceedingly surpass ours.

§ 10. *Brutes have memory.*—This faculty of laying up and retaining the ideas that are brought into the mind, several other animals seem to have to a great degree, as well as man. For to pass by other instances, birds learning of tunes, and the endeavours one may observe in them, to hit the notes right, put it past doubt with me, that they have perception, and retain ideas in their memories, and use them for patterns. For it seems to me impossible, that they should endeavour to conform their voices to notes (as it is plain they do) of which they had no ideas. For though I should grant, sound may mechanically cause a certain motion of the animal spirits in the brains of those birds, whilst the tune is actually playing; and that motion may be continued on to the muscles of the wings, and so the bird mechanically be driven away by certain noises, because this may tend to the bird's preservation; yet that can never be supposed a reason, why it should cause mechanically, either whilst the tune is playing, much less after it has ceased, such a motion in the organs of the bird's voice, as should conform it to the notes of a foreign sound, which intimation can be of no use to the bird's preservation: but, which is more, it cannot with any appearance of reason be supposed (much less proved) that birds, without sense and memory, can approach their notes, nearer and nearer by degrees, to a tune played yesterday; which, if they have no idea of in their memory, is no where, nor can be a pattern for them to imitate, or which any repeated essays can bring them nearer to. Since there is no reason why the sound of a pipe should leave traces in their brains, which, not at first, but by their after-endeavours, should produce the like sounds; and why the sounds they make themselves, should not make traces which they should follow, as well as those of the pipe, is impossible to conceive.

CHAP. XI.

OF DISCERNING, AND OTHER OPERATIONS OF THE MIND.

§ 1. *No knowledge without discernment.*—Another faculty we may take notice of in our minds, is that of discerning and distinguishing between the several ideas it has. It is not enough to have a confused perception of something in general: unless the mind had a distinct perception of different objects, and their qualities, it would be capable of very little knowledge; though the bodies that affect us, were as busy about us as they are now, and the mind were continually employed in thinking. On this faculty of distinguishing one thing from another, depends the evidence and certainty of several, even very general propo-

sitions which have passed for innate truths; because men overlooking the true cause, why those propositions find universal assent, impute it wholly to native uniform impressions; whereas it, in truth, depends upon this clear discerning faculty of the mind, whereby it perceives two ideas to be the same, or different. But of this, more hereafter.

§ 2. *The difference of wit and judgment.*—How much the imperfection of accurately discriminating ideas one from another lies, either in the dulness, or faults of the organs of sense; or want of acuteness, exercise, or attention in the understanding; or hastiness and precipitancy, natural to some tempers, I will not here examine: it suffices to take notice, that this is one of the operations that the mind may reflect on, and observe in itself. It is of that consequence to its other knowledge, that so far as this faculty is in itself dull, or not rightly made use of, for the distinguishing one thing from another, so far our notions are confused, and our reason and judgment disturbed or misled. If in having our ideas in the memory ready at hand, consists quickness of parts; in this of having them unconfused, and being able nicely to distinguish one thing from another, where there is but the least difference, consists, in a great measure, the exactness of judgment, and clearness of reason, which is to be observed in one man above another. And hence, perhaps, may be given some reason of that common observation, that men who have a great deal of wit, and prompt memories, have not always the clearest judgment, or deepest reason. For wit lying most in the assemblage of ideas, and putting those together with quickness and variety, wherein can be found any resemblance or congruity, thereby to make up pleasant pictures, and agreeable visions, in the fancy: judgment, on the contrary, lies quite on the other side, in separating carefully, one from another, ideas wherein can be found the least difference, thereby to avoid being misled by similitude, and, by affinity, to take one thing for another. This is a way of proceeding quite contrary to metaphor and allusion, wherein, for the most part, lies that entertainment and pleasantry of wit, which strikes so lively on the fancy, and, therefore, is so acceptable to all people; because its beauty appears at first sight, and there is required no labour of thought to examine what truth or reason there is in it. The mind, without looking any farther, rests satisfied with the agreeableness of the picture, and the gaiety of the fancy: and it is a kind of an affront to go about to examine it by the severe rules of truth and good reason; whereby it appears, that it consists in something that is not perfectly conformable to them.

§ 3. *Clearness alone hinders confusion.*—To the well distinguishing our ideas, it chiefly contributes, that they be clear and determinate: and where they are so, it will not breed any confusion or mistake about them, though the senses should (as sometimes they do) convey them from the same object differently, on different occasions, and so seem to err. For though a man in a fever should from sugar have a bitter taste, which at another time would produce a sweet one; yet the idea of bitter in that man's mind would be as clear and distinct from the idea of sweet, as if he had tasted only gall. Nor does it make any more confusion between the two ideas of sweet and bitter, that the same sort of body produces at one time one, and at another time another, idea,

by the taste, than it makes a confusion in two ideas of white and sweet, or white and round, that the same piece of sugar produces them both in the mind at the same time. And the ideas of orange colour and azure, that are produced in the mind by the same parcel of the infusion of lignum nephriticum, are no less distinct ideas, than those of the same colours, taken from two very different bodies.

§ 4. *Comparing*.—The comparing them one with another, in respect of extent, degrees, time, place, or any other circumstances, is another operation of the mind about its ideas, and is that upon which depends all that large tribe of ideas comprehended under relations; which of how vast an extent it is, I shall have occasion to consider hereafter.

§ 5. *Brutes compare, but imperfectly*.—How far brutes partake in this faculty, is not easy to determine; I imagine they have it not in any great degree; for though they probably have several ideas distinct enough, yet it seems to me to be the prerogative of human understanding, when it has sufficiently distinguished any ideas, so as to perceive them to be perfectly different, and so consequently two, to cast about and consider in what circumstances they are capable to be compared. And, therefore, I think, beasts compare not their ideas, farther than some sensible circumstances annexed to the objects themselves. The other power of comparing, which may be observed in men, belonging to general ideas, and useful only to abstract reasonings, we may probably conjecture beasts have not.

§ 6. *Compounding*.—The next operation we may observe in the mind about its ideas, is composition; whereby it puts together several of those simple ones it has received from sensation and reflection, and combines them into complex ones. Under this of composition, may be reckoned also that of enlarging; wherein, though the composition does not so much appear as in more complex ones, yet is nevertheless a putting several ideas together, though of the same kind. Thus, by adding several units together, we make the idea of a dozen; and putting together the repeated ideas of several perches, we frame that of a furlong.

§ 7. *Brutes compound but little*.—In this, also, I suppose, brutes come far short of men. For though they take in, and retain together, several combinations of simple ideas, as possibly the shape, smell, and voice of his master, make up the complex idea a dog has of him, or rather are so many distinct marks whereby he knows him: yet I do not think they do of themselves ever compound them, and make complex ideas. And perhaps, even where we think they have complex ideas, it is one simple one that directs them in the knowledge of several things, which possibly they distinguish less by their sight than we imagine. For I have been credibly informed, that a bitch will nurse, play with, and be fond of young foxes, as much as, and in place of, her puppies; if you can but get them once to suck her so long, that her milk may go through them. And those animals which have a numerous brood of young ones at once, appear not to have any knowledge of their number; for though they are mightily concerned for any one of their young, that are taken from them whilst they are in sight or hearing, yet if one or two of them be stolen from them in their absence, or without noise,

they appear not to miss them, or to have any sense that their number is lessened.

§ 8. *Naming*.—When children have, by repeated sensations, got ideas fixed in their memories, they begin, by degrees, to learn the use of signs. And when they have got the skill to apply the organs of speech to the framing of articulate sounds, they begin to make use of words to signify their ideas to others; these verbal signs they sometimes borrow from others, and sometimes make themselves, as one may observe among the new and unusual names children often give to things in the first use of language.

§ 9. *Abstraction*.—The use of words then being to stand as outward marks of our internal ideas, and those ideas being taken from particular things, if every particular idea that we take in, should have a distinct name, names must be endless. To prevent this, the mind makes the particular ideas received from particular objects, to become general; which is done by considering them as they are in the mind, such appearances, separate from all other existences, and the circumstances of real existence, as time, place, or any other concomitant ideas. This is called abstraction, whereby ideas, taken from particular beings, become general representatives of all of the same kind; and their names, general names, applicable to whatever exists conformable to such abstract ideas. Such precise naked appearances in the mind, without considering how, whence, or with what others they came there, the understanding lays up (with names commonly annexed to them) as the standard to rank real existences into sorts, as they agree with these patterns, and to denominate them accordingly. Thus the same colour being observed to-day in chalk or snow, which the mind yesterday received from milk, it considers that appearance alone makes it a representative of all of that kind; and having given it the name, whiteness, it by that sound signifies the same quality, wheresoever to be imagined or met with; and thus universals, whether ideas or terms, are made.

§ 10. *Brutes abstract not*.—If it may be doubted, whether beasts compound and enlarge their ideas, that way, to any degree; this I think, I may be positive in, that the power of abstracting is not at all in them; and that the having of general ideas, is that which puts a perfect distinction betwixt man and brutes, and is an excellency which the faculties of brutes do by no means attain to. For, it is evident, we observe no footsteps in them, of making use of general signs for universal ideas; from which we have reason to imagine, that they have not the faculty of abstracting, or making general ideas, since they have no use of words, or any other general signs.

§ 11. Nor can it be imputed to their want of fit organs to frame articulate sounds, that they have no use or knowledge of general words; since many of them, we find can fashion such sounds, and pronounce words distinctly enough, but never with any such application. And, on the other side, men, who, through some defect in the organs, want words, yet fail not to express their universal ideas by signs, which serve them instead of general words; a faculty which we see beasts come short in. And, therefore, I think, we may suppose, that it is in this that the species of brutes are discriminated from man; and it is that

proper difference wherein they are wholly separated, and which, at last widens to so vast a distance. For if they have any ideas at all, and are not bare machines (as some would have them), we cannot deny them to have some reason. It seems as evident to me, that they do some of them, in certain instances, reason, as that they have sense; but it is only in particular ideas just as they received them from their senses. They are the best of them tied up within those narrow bounds, and have not (as I think) the faculty to enlarge them by any kind of abstraction.

§ 12. *Idiots and madmen.*—How far idiots are concerned in the want or weakness of any, or all, of the foregoing faculties, an exact observation of their several ways of faltering, would no doubt discover. For those who either perceive but dully, or retain the ideas that come into their minds but ill, who cannot readily excite or compound them, will have little matter to think on. Those who cannot distinguish, compare, and abstract, would hardly be able to understand, and make use of language, or judge, or reason, to any tolerable degree: but only a little, and imperfectly, about things present, and very familiar to their senses. And, indeed, any of the fore-mentioned faculties, if wanting, or out of order, produce suitable defects in men's understandings and knowledge.

§ 13. In fine, the defect in naturals seems to proceed from want of quickness, activity, and motion in the intellectual faculties, whereby they are deprived of reason: whereas madmen, on the other side, seem to suffer by the other extreme. For they do not appear to me to have lost the faculty of reasoning; but having joined together some ideas very wrongly, they mistake them for truths; and they err as men do that argue right from wrong principles: for by the violence of their imaginations, having taken their fancies for realities, they make right deductions from them. Thus you shall find a distracted man fancying himself a king, with a right inference require suitable attendance, respect, and obedience: others, who have thought themselves made of glass, have used the caution necessary to preserve such brittle bodies. Hence it comes to pass, that a man, who is very sober, and of a right understanding in all other things, may, in one particular, be as frantic as any in Bedlam; if either by any sudden very strong impression, or long fixing his fancy upon one sort of thoughts, incoherent ideas have been cemented together so powerfully, as to remain united. But there are degrees of madness, as of folly; the disorderly jumbling ideas together is in some more, some less. In short, herein seems to lie the difference between idiots and madmen, that madmen put wrong ideas together, and so make wrong propositions, but argue and reason right from them: but idiots make very few or no propositions, and reason scarce at all.

§ 14. *Method.*—These, I think, are the first faculties and operations of the mind, which it makes use of in understanding; and though they are exercised about all its ideas in general, yet the instances I have hitherto given, have been chiefly in simple ideas; and I have subjoined the explication of these faculties of the mind, to that of simple ideas before I come to what I have to say concerning complex ones, for these following reasons:

First, Because several of these faculties being exercised at first priu

cially about simple ideas, we might, by following nature in its ordinary method, trace and discover them in their rise, progress, and gradual improvements.

Secondly, Because observing the faculties of the mind, how they operate about simple ideas, which are usually in most men's minds much more clear, precise, and distinct, than complex ones, we may the better examine and learn how the mind abstracts, denominates, compares, and exercises its other operations about those which are complex, wherein we are much more liable to mistake.

Thirdly, Because these very operations of the mind about ideas received from sensations, are themselves, when reflected on, another set of ideas, derived from that other source of our knowledge, which I call reflection; and, therefore, fit to be considered in this place, after the simple ideas of sensation. Of compounding, comparing, abstracting, &c. I have but just spoken, having occasion to treat of them more at large in other places.

§ 15. *These are the beginnings of human knowledge.*—And thus I have given a short, and I think, true history of the first beginnings of human knowledge; whence the mind has its first objects, and by what steps it makes its progress to the laying in, and storing up, those ideas, out of which is to be framed all the knowledge it is capable of; wherein I must appeal to experience and observation, whether I am in the right: the best way to come to truth, being to examine things as really they are, and not to conclude they are, as we fancy ourselves, or have been taught by others to imagine.

§ 16. *Appeal to experience.*—To deal truly, this is the only way that I can discover, whereby the ideas of things are brought into the understanding. If other men have either innate ideas, or infused principles, they have reason to enjoy them; and if they are sure of it, it is impossible for others to deny them the privilege that they have above their neighbours. I can speak but of what I find in myself, and is agreeable to those notions; which, if we will examine the whole course of men in their several ages, countries, and education, seem to depend on those foundations which I have laid, and to correspond with this method, in all the parts and degrees thereof.

§ 17. *Dark room.*—I pretend not to teach, but to inquire; and, therefore, cannot but confess, here again, that external and internal sensation are the only passages, that I can find, of knowledge to the understanding. These alone, as far as I can discover, are the windows by which light is let into this dark room: for, methinks, the understanding is not much unlike a closet wholly shut from light, with only some little opening left, to let in external visible resemblances, or ideas of things without: would the pictures coming into such a dark room but stay there, and lie so orderly as to be found upon occasion, it would very much resemble the understanding of a man, in reference to all objects of sight, and the ideas of them.

These are my guesses concerning the means whereby the understanding comes to have, and retain, simple ideas; and the modes of them, with some other operations about them. I proceed now to examine some of these simple ideas, and their modes, a little more particularly.

CHAP. XII.

OF COMPLEX IDEAS.

§ 1. *Made by the mind out of simple ones.*—We have hitherto considered those ideas, in the reception whereof the mind is only passive, which are those simple ones received from sensation and reflection before mentioned, whereof the mind cannot make one to itself, nor have any idea which does not wholly consist of them. But as the mind is wholly passive in the reception of all its simple ideas, so it exerts several acts of its own, whereby, out of its simple ideas, as the materials and foundations of the rest, the others are framed. The acts of the mind wherein it exerts its power over its simple ideas, are chiefly these three: 1. Combining several simple ideas into one compound one, and thus all complex ideas are made. 2. The second is bringing two ideas, whether simple or complex, together; and setting them by one another, so as to take a view of them at once, without uniting them into one; by which way it gets all ideas of relations. 3. The third is separating them from all other ideas that accompany them in their real existence; that is called abstraction; and thus all its general ideas are made. This shews man's power, and its way of operation, to be much the same in the material and intellectual world; for the material in both being such as he has no power over, either to make or destroy, all that man can do, is either to unite them together, or to set them by one another, or wholly separate them. I shall here begin with the first of these, in the consideration of complex ideas, and come to the other two, in their due places. As simple ideas are observed to exist in several combinations united together; so the mind has a power to consider several of them united together, as one idea; and that not only as they are united in external objects, but as itself has joined them. Ideas thus made up of several simple ones put together, I call complex; such as are beauty, gratitude, a man, an army, the universe; which, though complicated of various simple ideas, or complex ideas made up of simple ones, yet are, when the mind pleases, considered each by itself, as one entire thing, and signified by one name.

§ 2. *Made voluntarily.*—In this faculty of repeating and joining together its ideas, the mind has great power in varying and multiplying the objects of its thoughts, infinitely beyond what sensation or reflection furnishes it with; but all this still confined to those simple ideas which it received from those two sources, which are the ultimate materials of all its compositions. For simple ideas are all from things themselves; and of these the mind can have no more, nor other, than what are suggested to it. It can have no other ideas of sensible qualities, than what come from without, by the senses; nor any ideas of other kind of operations of a thinking substance, than what it finds in itself: but when it has once got these simple ideas, it is not confined barely to observation, and what offers itself from without it: it can by its own power, put together those ideas it has, and make new complex ones, which it never received so united.

§ 3. *Are either modes, substances, or relations.*—Complex ideas, however compounded and decompounded, though their number be infinite, and the variety endless, wherewith they fill and entertain the thoughts of men; yet, I think, they may be all reduced under these three heads: 1. Modes. 2. Substances. 3. Relations.

§ 4. *Modes.*—*First*, Modes I call such complex ideas, which, however compounded, contain not in them the supposition of subsisting by themselves, but are considered as dependences on, or affections of, substances; such are ideas signified by the words triangle, gratitude, murder, &c. And if in this I use the word mode in somewhat a different sense from its ordinary signification, I beg pardon; it being unavoidable in discourses differing from the ordinary received notions, either to make new words, or to use old words in somewhat a new signification; the latter whereof, in our present case, is perhaps the most tolerable of the two.

§ 5. *Simple and mixed modes.*—Of these modes there are two sorts, which deserve distinct consideration. *First*, There are some which are only variations, or different combinations of the same simple idea, without the mixture of any other, as a dozen, or score; which are nothing but the ideas of so many distinct units added together, and these I call simple modes, as being contained within the bounds of one simple idea. *Secondly*, There are others compounded of simple ideas of several kinds, put together to make one complex one; v. g. beauty, consisting of a certain composition of colour and figure, causing delight in the beholder; theft, which being the concealed change of the possession of any thing, without the consent of the proprietor, contains, as is visible, a combination of several ideas of several kinds: and these I call mixed modes.

§ 6. *Substances, single or collective.*—*Secondly*, The ideas of substances are such combinations of simple ideas, as are taken to represent distinct particular things subsisting by themselves; in which the supposed, or confused, idea of substance, such as it is, is always the first and chief. Thus, if to substance be joined the simple idea of a certain dull whitish colour, with certain degrees of weight, hardness, ductility, and fusibility, we have the idea of lead: and a combination of the ideas of a certain sort of figure, with the powers of motion, thought, and reasoning, joined to substance, make the ordinary idea of a man. Now, of substances also, there are two sort of ideas; one of single substances, as they exist separately, as of a man, or a sheep; the other of several of those put together, as an army of men, or flock of sheep; which collective ideas of several substances thus put together, are as much each of them one single idea, as that of a man, or an unit.

§ 7. *Relation.*—*Thirdly*, The last sort of complex ideas is, that we call relation, which consists in the consideration and comparing one idea with another; of these several kinds we shall treat in their order.

§ 8. *The abstrusest ideas from the two sources.*—If we trace the progress of our minds, and with attention observe how it repeats, adds together, and unites its simple ideas received from sensation or reflection, it will lead us farther than at first, perhaps, we should have imagined. And, I believe, we shall find, if we warily observe the originals of our

notions, that even the most abstruse ideas, how remote soever they may seem from sense, or from any operations of our own minds, are yet only such as the understanding frames to itself, by repeating and joining together ideas, that it had, either from objects of sense, or from its own operations about them; so that even those large and abstract ideas are derived from sensation or reflection, being no other than what the mind, by the ordinary use of its own faculties, employed about ideas received from objects of sense, or from the operations it observes itself about them, may, and does, attain unto. This I shall endeavour to shew in the ideas we have of space, time, and infinity, and some few others that seem the most remote from those originals.

CHAP. XIII.

OF SIMPLE MODES ; AND FIRST, OF THE SIMPLE MODES OF SPACE.

§ 1. *Simple Modes*.—Though, in the foregoing part, I have often mentioned simple ideas, which are truly the materials of all our knowledge; yet having treated of them there, rather in the way that they come into the mind, than as distinguished from others more compounded, it will not be, perhaps, amiss to take a view of some of them again under this consideration, and examine those different modifications of the same idea, which the mind either finds in things existing, or is able to make within itself, without the help of any extrinsical object, or any foreign suggestion.

Those modifications of any one simple idea (which, as has been said, I call simple modes) are as perfectly different and distinct ideas in the mind, as those of the greatest distance or contrariety. For the idea of two, is as distinct from that of one, as blueness from heat, or either of them from any number: and yet it is made up only of that simple idea of an unit repeated; and repetitions of this kind joined together, make those distinct simple modes, of a dozen, a gross, a million.

§ 2. *Idea of space*.—I shall begin with the simple idea of space. I have shewed above, c. 4., that we get the idea of space, both by our sight and touch; which, I think, is so evident, that it would be as needless to go to prove, that men perceive, by their sight, a distance between bodies of different colours, or between the parts of the same body; as that they see colours themselves; nor is it less obvious, that they can do so in the dark by feeling and touch.

§ 3. *Space and extension*.—This space, considered barely in length between any two beings, without considering any thing else between them, is called distance; if considered in length, breadth, and thickness, I think it may be called capacity; the term extension is usually applied to it in what manner soever considered.

§ 4. *Immensity*.—Each different distance, is a different modification of space; and each idea of any different distance, or space, is a simple mode of this idea. Men, for the use, and by the custom of measuring, settle in their minds the ideas of certain stated lengths, such as are an inch, foot, yard, fathom, mile, diameter of the earth, &c., which are so many distinct ideas made up only of space. When any such stated

lengths or measures of space are made familiar to men's thoughts, they can, in their minds, repeat them as often as they will, without mixing or joining to them the idea of body, or any thing else; and frame to themselves the idea of long, square, or cubic feet, yards, or fathoms, here amongst the bodies of the universe, or else beyond the utmost bounds of all bodies; and by adding these still one to another, enlarge their ideas of space as much as they please. The power of repeating or doubling any idea we have of any distance, and adding it to the former as often as we will, without being ever able to come to any stop or stint, let us enlarge it as much as we will, is that which gives us the idea of immensity.

§ 5. *Figure*.—There is another modification of this idea, which is nothing but the relation which the parts of the termination of extension, or circumscribed space, have amongst themselves. This the touch discovers in sensible bodies, whose extremities come within our reach; and the eye takes both from bodies and colours, whose boundaries are within its view; where observing how the extremities terminate either in straight lines, which meet at discernible angles; or in crooked lines, wherein no angles can be perceived, by considering these as they relate to one another, in all parts of the extremities of any body or space, it has that idea we call figure, which affords to the mind infinite variety. For besides the vast number of different figures that do really exist in the coherent masses of matter, the stock that the mind has in its power, by varying the idea of space, and thereby making still new compositions, by repeating its own ideas, and joining them as it pleases, is perfectly inexhaustible; and so it can multiply figures in infinitum.

§ 6. *Figure*.—For the mind having a power to repeat the idea of any length directly stretched out, and join it to another in the same direction, which is to double the length of that straight line, or else join another with what inclination it thinks fit, and so make what sort of angle it pleases; and being able also to shorten any line it imagines, by taking from it one half, or one fourth, or what part it pleases, without being able to come to an end of any such divisions, it can make an angle of any bigness; so also the lines that are its sides, of what length it pleases, which joining again to other lines of different lengths, and at different angles, until it has wholly enclosed any space, it is evident that it can multiply figures, both in their shape and capacity, in infinitum; all which are but so many different simple modes of space.

The same that it can do with straight lines, it can also do with crooked, or crooked and straight together; and the same it can do in lines, it can also in superficies; by which we may be led into farther thoughts of the endless variety of figures that the mind has a power to make, and thereby to multiply the simple modes of space.

§ 7. *Place*.—Another idea coming under this head, and belonging to this tribe, is that we call place. As in simple space we consider the relation of distance between any two bodies or points; so in our idea of place, we consider the relation of distance betwixt any thing, and any two or more points, which are considered as keeping the same distance one with another, and so considered as at rest: for when we

find any thing at the same distance now, which it was yesterday, from any two or more points, which have not since changed their distance one with another, and with which we then compared it, we say it hath kept the same place : but if it hath sensibly altered its distance with either of those points, we say it hath changed its place : though vulgarly speaking, in the common notion of place, we do not always exactly observe the distance from these precise points ; but from larger portions of sensible objects, to which we consider the thing placed to bear relation, and distance from which we have some reason to observe.

§ 8. Thus, a company of chess-men, standing on the same squares of the chess-board where we left them, we say, they are all in the same place, or unmoved ; though perhaps, the chess-board hath been in the mean time carried out of one room into another, because we compared them only to the parts of the chess-board, which keep the same distance one with another. The chess-board, we also say, is in the same place it was, if it remain in the same part of the cabin, though, perhaps, the ship which it is in, sails all the while : and the ship is said to be in the same place, supposing it kept the same distance with the parts of the neighbouring land ; though, perhaps, the earth has turned round ; and so both chess-men, and board, and ship, have every one changed place, in respect of remoter bodies, which have kept the same distance one with another. But yet the distance from certain parts of the board, being that which determines the place of the chess-men ; and the distance from the fixed parts of the cabin (with which we made the comparison) being that which determines the place of the chess-board ; and the fixed parts of the earth, that by which we determined the place of the ship, these things may be said to be in the same place, in those respects : though their distance from some other things, which, in this matter, we did not consider, being varied, they have undoubtedly changed place in that respect ; and we ourselves shall think so, when we have occasion to compare them with those other.

§ 9. But this modification of distance we call place, being made by men for their common use, that by it they might be able to design the particular position of things ; where they had occasion for such designation, men consider and determine of this place, by reference to those adjacent things which best served to their present purpose, without considering other things, which, to answer another purpose, would better determine the place of the same thing. Thus, in the chess-board, the use of the designation of the place of each chess-man being determined only within that chequered piece of wood, it would cross that purpose, to measure it by any thing else : but when these very chess-men are put up in a bag, if any one should ask where the black king is, it would be proper to determine the place by the parts of the room it was in, and not by the chess-board ; there being another use of designing the place it is now in, than when in play it was on the chess-board, and so must be determined by other bodies. So if any one should ask in what place are the verses which report the story of Nisus and Euryalus, it would be very improper to determine this place, by saying, they were in such a part of the earth, or in Bodley's library ; but the right designation of the place would be by the parts of Virgil's works ; and the proper an-

swer would be that these verses were about the middle of the ninth book of his *Æneid* ; and that they have been always constantly in the same place ever since Virgil was printed : which is true, though the book itself hath moved a thousand times ; the use of the idea of place, here, being to know in what part of the book that story is, that so, upon occasion, we may know where to find it, and have recourse to it for use.

§ 10. *Place*.—That our idea of place is nothing else but such a relative position of anything, as I have before mentioned, I think is plain, and will be easily admitted, when we consider that we can have no idea of the place of the universe, though we can of all the parts of it ; because, beyond that, we have not the idea of any fixed, distinct, particular beings, in reference to which we can imagine it to have any relation of distance ; but all beyond it is one uniform space or expansion, wherein the mind finds no variety, no marks. For to say that the world is somewhere, means no more than that it does exist : this, though a phrase borrowed from place, signifying only its existence, not location ; and when one can find out and frame in his mind, clearly and distinctly, the place of the universe, he will be able to tell us, whether it moves or stands still in the undistinguishable inane of infinite space ; though it be true, that the word place has sometimes a more confused sense, and stands for that space which any body takes up ; and so the universe is in a place. The idea, therefore, of place, we have by the same means that we get the idea of space (whereof this is but a particular consideration), viz., by our sight and touch ; by either of which we receive into our minds the ideas of extension or distance.

§ 11. *Extension and body not the same*.—There are some that would persuade us, that body and extension are the same thing ; who either change the signification of words, which I would not suspect them of, they having so severely condemned the philosophy of others, because it hath been too much placed in the uncertain meaning, or deceitful obscurity, of doubtful or insignificant terms. If, therefore, they mean by body and extension, the same that other people do, viz., by body, something that is solid and extended, whose parts are separable and moveable different ways ; and by extension, only the space that lies between the extremities of those solid coherent parts, and which is possessed by them, they confound very different ideas one with another. For I appeal to every man's own thoughts, whether the idea of space be not as distinct from that of solidity, as it is from the idea of scarlet colour ? It is true, solidity cannot exist without extension, neither can scarlet colour exist without extension ; but this hinders not but they are distinct ideas. Many ideas require others as necessary to their existence or conception, which yet are very distinct ideas. Motion can neither be, nor be conceived, without space ; and yet motion is not space, nor space, motion : space can exist without it, and they are very distinct ideas ; and so, I think, are those of space and solidity. Solidity is so inseparable an idea from body, that upon that depends its filling of space, its contact, impulse, and communication of motion upon impulse. And if it be a reason to prove, that spirit is different from body, because thinking includes not the idea of extension in it ; the same reason will be as valid, I suppose, to prove, that space is not body, because it includes not the idea of so-

lidity in it ; space and solidity being as distinct ideas, as thinking and extension, and as wholly separable in the mind one from another. Body then, and extension, it is evident, are two distinct ideas. For,

§ 12. *First*, Extension includes no solidity, no resistance to the motion of body, as body does.

§ 13. *Secondly*, The parts of pure space are inseparable one from the other ; so that the continuity cannot be separated, neither really nor mentally. For I demand of any one to remove any part of it from another, with which it is continued, even so much as in thought. To divide and separate actually, is, as I think, by removing the parts one from another, to make two superficies, where before there was a continuity : and to divide mentally, is to make in the mind two superficies, where before there was a continuity ; and consider them as removed one from the other ; which can only be done in things considered by the mind as capable of being separated ; and by separation of acquiring new distinct superficies, which they then have not, but are capable of : but neither of these ways of separation, whether real or mental, is, as I think, compatible to pure space.

It is true, a man may consider so much of such a space as is answerable or commensurate to a foot, without considering the rest, which is, indeed, a partial consideration, but not so much as mental separation or division : since a man can no more mentally divide, without considering two superficies, separate one from the other, than he can actually divide without making two superficies disjoined one from the other : but a partial consideration is not separating. A man may consider light in the sun, without its heat ; or mobility in body, without its extension, without thinking of their separation. One is only a partial consideration, terminating in one alone ; and the other is a consideration of both, as existing separately.

§ 14. *Thirdly*, The parts of pure space are immoveable, which follows from their inseparability ; motion being nothing but change of distance between any two things : but this cannot be between parts that are inseparable ; which, therefore, must needs be at perpetual rest one amongst another.

Thus the determined idea of simple space, distinguishes it plainly and sufficiently from body ; since its parts are inseparable, immoveable, and without resistance to the motion of body.

§ 15. *The definition of extension explains it not.*—If any one ask me, what this space I speak of, is ? I will tell him, when he tells me what his extension is ? For to say, as is usually done, that extension is to have *partes extra partes*, is to say only, that extension is extension : for what am I the better informed in the nature of extension, when I am told, that extension is to have parts that are extended, exterior to parts that are extended, i. e. extension consists of extended parts ? As if one asking what a fibre was ? I should answer him, that it was a thing made up of several fibres : would he thereby be enabled to understand what a fibre was, better than he did before ? Or rather, would he not have reason to think that my design was to make sport with him, rather than seriously to instruct him ?

§ 16. *Division of beings into bodies and spirits, proves not space and*

body the same.—Those who contend that space and body are the same, bring this dilemma: either this space is something or nothing; if nothing be between two bodies, they must necessarily touch; if it be allowed to be something, they ask, whether it be body or spirit? To which I answer, by another question, who told them that there was or could be nothing but solid beings which could not think, and thinking beings that were not extended? Which is all they mean by the terms body and spirit.

§ 17. *Substance, which we know not, no proof against space without body.*—If it be demanded (as usually it is) whether this space, void of body, be substance or accident? I shall readily answer, I know not: nor shall be ashamed to own my ignorance, till they that ask, shew me a clear distinct idea of substance.

§ 18. I endeavour, as much as I can, to deliver myself from those fallacies which we are apt to put upon ourselves, by taking words for things. It helps not our ignorance to feign a knowledge where we have none, by making a noise with sounds, without clear and distinct significations. Names made at pleasure, neither alter the nature of things, nor make us understand them, but as they are signs of, and stand for, determined ideas. And I desire those who lay so much stress on the sound of these two syllables, substance, to consider whether applying it, as they do, to the infinite incomprehensible God, to finite spirit, and to body, it be in the same sense; and whether it stands for the same idea, when each of those three so different beings are called substances? If so, whether it will thence follow, that God, spirits, and body, agreeing in the same common nature of substance, differ not any otherwise than in a bare different modification of that substance; as a tree and a pebble, being in the same sense, body, and agreeing in the common nature of body, differ only in a bare modification of that common matter; which will be a very harsh doctrine. If they say, that they apply it to God, finite spirits, and matter, in three different significations, and that it stands for one idea when God is said to be a substance; for another, when the soul is called substance; and for a third, when a body is called so; if the name substance stands for three several distinct ideas, they would do well to make known those distinct ideas, or at least to give three distinct names to them, to prevent in so important a notion, the confusion and errors that will naturally follow from the promiscuous use of so doubtful a term; which is so far from being suspected to have three distinct, that in ordinary use it has scarce one clear distinct signification: and if they can thus make three distinct ideas of substance, what hinders why another may not make a fourth?

§ 19. *Substance and accidents of little use in philosophy.*—They who first ran into the notion of accidents, as a sort of real beings, that needed something to inhere in, were forced to find out the word substance, to support them. Had the poor Indian philosopher (who imagined that the earth also wanted something to bear it up) but thought of this word substance, he needed not to have been at the trouble to find an elephant to support it, and a tortoise to support his elephant; the word substance would have done it effectually. And he that inquired, might have taken it for as good an answer from an Indian philosopher,

that substance, without knowing what it is, is that which supports the earth, as we take it for a sufficient answer, and good doctrine, from our European philosophers, that substance, without knowing what it is, is that which supports accidents. So that of substance we have no idea of what it is, but only a confused obscure one of what it does.

§ 20. Whatever a learned man may do here, an intelligent American, who inquired into the nature of things, would scarce take it for a satisfactory account, if desiring to learn our architecture, he should be told, that a pillar was a thing supported by a basis, and a basis something that supported a pillar. Would he not think himself mocked, instead of taught, with such an account as this? and a stranger to them would be very liberally instructed in the nature of books, and the things they contained, if he should be told, that all learned books consisted of paper and letters, and that letters were things inhering in paper, and paper a thing that held forth letters; a notable way of having clear ideas of letters and papers! but were the Latin words, *inhærentia* and *substantia* put into the plain English ones that answer them, and were called sticking on, and underpropping, they would better discover to us the very great clearness there is in the doctrine of substance and accidents, and shew of what use they are in deciding of questions in philosophy.

§ 21. *A vacuum beyond the utmost bounds of body.*—But to return to our idea of space. If body be not supposed infinite, which, I think, no one will affirm, I would ask, whether, if God placed a man at the extremity of corporeal beings, he could not stretch his hand beyond his body? If he could, then he would put his arm where there was before space without body; and if there he spread his fingers, there would still be space between them without body. If he could not stretch out his hand, it must be because of some external hindrance (for we suppose him alive, with such a power of moving the parts of his body that he hath now, which is not in itself impossible, if God so pleased to have it; or, at least, it is not impossible for God so to move him); and then I ask, whether that which hinders his hand from moving outwards, be substance or accident, something or nothing? and when they have resolved that, they will be able to resolve themselves what that is, which is or may be between two bodies at a distance, that is not body, and has no solidity. In the mean time, the argument is at least as good, that where nothing hinders (as beyond the utmost bounds of all bodies), a body put in motion may move on, as where there is nothing between, there two bodies must necessarily touch: for pure space between, is sufficient to take away the necessity of mutual contact; but bare space in the way, is not sufficient to stop motion. The truth is, these men must either own, that they think body infinite, though, they are loth to speak it out; or else affirm, that space is not body. For I would fain meet with that thinking man, that can, in his thoughts, set any bounds to space, more than he can to duration; or, by thinking, hope to arrive at the end of either: and, therefore, if his idea of eternity be infinite, so is his idea of immensity; they are both finite or infinite alike.

§ 22. *The power of annihilation proves a vacuum.*—Farther, those

who assert the impossibility of space existing without matter, must not only make body infinite, but must also deny a power in God to annihilate any part of matter. No one, I suppose, will deny, that God can put an end to all motion that is in matter, and fix all the bodies of the universe in a perfect quiet and rest, and continue them so long as he pleases. Whoever then will allow, that God can, during such a general rest, annihilate either this book, or the body of him that reads it, must necessarily admit the possibility of a vacuum: for it is evident, that the space that was filled by the parts of the annihilated body, will still remain, and be a space without body. For circumambient bodies being in perfect rest, are a wall of adamant, and, in that state, make it a perfect impossibility for any other body to get into that space. And, indeed, the necessary motion of one particle of matter, into the place from whence another particle of matter is removed, is but a consequence from the supposition of plentitude, which will, therefore, need some better proof than a supposed matter of fact, which experiment can never make out; our own clear and distinct ideas plainly satisfying us, that there is no necessary connexion between space and solidity, since we can conceive the one without the other. And those who dispute for or against a vacuum, do thereby confess they have distinct ideas of vacuum and plenum, i. e. that they have an idea of extension void of solidity, though they deny its existence, or else they dispute about nothing at all. For they who so much alter the signification of words, as to call extension, body, and consequently make the whole essence of body to be nothing but pure extension, without solidity, must talk absurdly whenever they speak of vacuum, since it is impossible for extension to be without extension: for vacuum, whether we affirm or deny its existence, signifies space without body, whose very existence no one can deny to be possible, who will not make matter infinite, and take from God a power to annihilate any particle of it.

§ 23. *Motion proves a vacuum.*—But not to go so far as beyond the utmost bounds of body in the universe, nor appeal to God's Omnipotency to find a vacuum, the motion of bodies that are in our view and neighbourhood, seems to me plainly to evince it. For I desire any one so to divide a solid body of any dimension he pleases, as to make it possible for the solid parts to move up and down freely every way within the bounds of that superficies, if there be not left in it a void space, as big as the least part into which he has divided the said solid body. And if where the least particle of the body divided is as big as a mustard-seed, a void space equal to the bulk of a mustard-seed be requisite to make room for free motion of the parts of the divided body within the bounds of its superficies, where the particles of matter are 100,000,000 less than a mustard-seed; there must also be a space void of solid matter, as big as 100,000,000 part of a mustard-seed: for if it hold good in one, it will hold in the other, and so on in infinitum. And let this void space be as little as it will, it destroys the hypothesis of plentitude. For if there can be a space void of body, equal to the smallest separate particle of matter now existing in nature, it is still space without body, and makes as great a difference between space and body, as if it were μέγα χάσμα, a distance as wide as any in

nature. And, therefore, if we suppose not the void space necessary to motion, equal to the least parcel of the divided solid matter, but to $\frac{1}{10}$ or $\frac{1}{1000}$ of it, the same consequence will always follow of space without matter.

§ 24. *The ideas of space and body distinct.*—But the question being here, “Whether the idea of space or extension be the same with the idea of body,” it is not necessary to prove the real existence of a vacuum, but the idea of it; which it is plain men have, when they inquire and dispute whether there be a vacuum or no? for if they had not the idea of space without body, they could not make a question about its existence: and if their idea of body did not include in it something more than the bare idea of space, they could have no doubt about the plentitude of the word; and it would be as absurd to demand, whether there were space without body, as whether there were space without space, or body without body, since these were but different names of the same idea.

§ 25. *Extension being inseparable from body, proves it not the same.*—It is true, that the idea of extension joins itself so inseparably with all visible, and most tangible, qualities, that it suffers us to see no one, or feel very few external objects, without taking in impressions of extension too. This readiness of extension to make itself be taken notice of so constantly with other ideas, has been the occasion, I guess, that some have made the whole essence of body to consist in extension; which is not so much to be wondered at, since some have had their minds, by their eyes and touch (the busiest of all our senses), so filled with the idea of extension, and, as it were, wholly possessed with it, that they allowed no existence to any thing that had not extension. I shall not now argue with those men, who take the measure and possibility of all being, only from their narrow and gross imaginations; but having here to do only with those who conclude the essence of body to be extension, because, they say, they cannot imagine any sensible quality of any body without extension, I shall desire them to consider, that had they reflected on their ideas of tastes and smells, as much as on those of sight and touch, nay, had they examined their ideas of hunger and thirst, and several other pains, they would have found that they included in them no idea of extension at all, which is but an affection of body, as well as the rest, discoverable by our senses, which are scarce acute enough to look into the pure essences of things.

§ 26. If those ideas, which are constantly joined to all others, must, therefore, be concluded to be the essence of those things which have constantly those ideas joined to them, and are inseparable from them; then unity is, without doubt, the essence of every thing. For there is not any object of sensation or reflection, which does not carry with it the idea of one; but the weakness of this kind of argument we have already shewn sufficiently.

§ 27. *Ideas of space and solidity distinct.*—To conclude: whatever men shall think concerning the existence of vacuum, this is plain to me, that we have as clear an idea of space, distinct from solidity, as we have of solidity, distinct from motion, or motion from space. We have not any two more distinct ideas; and we can as easily conceive

space without solidity, as we can conceive body or space without motion, though it be never so certain, that neither body nor motion can exist without space. But whether any one will take space to be only a relation resulting from the existence of other beings at a distance, or whether they will think the words of the most knowing King Solomon, "The heaven, and the heaven of heavens, cannot contain thee;" or those more emphatical ones of the inspired philosopher, St. Paul, "In him we live, move, and have our being," are to be understood in a literal sense, I leave every one to consider; only our idea of space is, I think, such as I have mentioned, and distinct from that of body. For whether we consider, in matter itself, the distance of its coherent solid parts, and call it, in respect of those solid parts, extension; or, whether considering it as lying between the extremities of any body in its several dimensions, we call it length, breadth, and thickness; or else considering it as lying between any two bodies, or positive beings, without any consideration whether there be any matter or no between, we call it distance. However named or considered, it is always the same uniform simple idea of space, taken from objects about which our senses have been conversant, whereof having settled ideas in our minds, we can revive, repeat, and add them one to another, as often as we will, and consider the space or distance so imagined, either as filled with solid parts, so that another body cannot come there without displacing and thrusting out the body that was there before; or else as void of solidity, so that a body of equal dimensions to that empty or pure space, may be placed in it without the removing or expulsion of any thing that was there. But to avoid confusion in discourses concerning this matter, it were possibly to be wished, that the name extension were applied only to matter, or the distance of the extremities of particular bodies; and the term expansion to space in general, with or without solid matter possessing it, so as to say, space is expanded, and body extended. But in this every one has liberty; I propose it only for the more clear and distinct way of speaking.

§ 28. *Men differ little in clear simple ideas.*—The knowing precisely what our words stand for, would, I imagine, in this, as well as a great many other cases, quickly end the dispute. For I am apt to think, that men, when they come to examine them, find their simple ideas all generally to agree, though, in discourse with one another, they, perhaps, confound one another with different names. I imagine that men who abstract their thoughts, and do well examine the ideas of their own minds, cannot much differ in thinking; however they may perplex themselves with words, according to the way of speaking of the several schools or sects they have been bred up in; though, amongst unthinking men, who examine not scrupulously and carefully their own ideas, and strip them not from the marks men use for them, but confound them with words, there must be endless dispute, wrangling, and jargon, especially if they be learned bookish men, devoted to some sect, and accustomed to the language of it; and have learned to talk after others. But if it should happen, that any two thinking men should really have different ideas, I do not see how they could discourse or argue one with another. Here I must not be mistaken to think that every floating

imagination in men's brains, is presently of that sort of ideas I speak of. It is not easy for the mind to put off those confused notions and prejudices it has imbibed from custom, inadvertency, and common conversation; it requires pains and assiduity to examine its ideas, until it resolves them into those clear and distinct simple ones out of which they are compounded: and to see which, amongst its simple ones, have, or have not, a necessary connexion and dependence one upon another. Until a man doth this in the primary and original notion of things, he builds upon floating and uncertain principles, and will often find himself at a loss.

CHAP. XIV.

OF DURATION, AND ITS SIMPLE MODES.

§ 1. *Duration is fleeting extension.*—There is another sort of distance, or length, the idea whereof we get, not from the permanent parts of space, but from the fleeting and perpetually perishing parts of succession. This we call duration, the simple modes whereof are any different lengths of it, whereof we have distinct ideas, as hours, days, years, &c., time and eternity.

§ 2. *Its ideas from reflection on the train of our ideas.*—The answer of a great man, to one who asked what time was, *Si non rogas intelligo* (which amounts to this; the more I set myself to think of it, the less I understand it), might, perhaps, persuade one, that time, which reveals all other things, is itself not to be discovered. Duration, time, and eternity, are not, without reason, thought to have something very abstruse in their nature. But however remote these may seem from our comprehension, yet if we trace them right to their originals, I doubt not but one of those sources of all our knowledge, viz., sensation and reflection, will be able to furnish us with these ideas, as clear and distinct as many others which are thought much less obscure; and we shall find, that the idea of eternity itself, is derived from the same common original with the rest of our ideas.

§ 3. To understand time and eternity aright, we ought, with attention, to consider what idea it is we have of duration, and how we came by it. It is evident to any one who will but observe what passes in his own mind, that there is a train of ideas which constantly succeed one another in his understanding, as long as he is awake. Reflection on these appearances of several ideas, one after another, in our minds, is that which furnishes us with the idea of succession; and the distance between any parts of that succession, or between the appearance of any two ideas in our minds, is that we call duration. For whilst we are thinking, or whilst we receive successively several ideas in our minds we know that we do exist; and so we call the existence, or the continuation of the existence of ourselves, or any thing else, commensurate to the succession of any ideas in our minds, the duration of ourselves or any such other thing co-existent with our thinking.

§ 4. That we have our notion of succession and duration, from this original, viz., from reflection on the train of ideas which we find to appear, one after another, in our own minds, seems plain to me, in the

we have no perception of duration, but by considering the train of ideas that take their turns in our understandings. When that succession of ideas ceases, our perception of duration ceases with it; which every one clearly experiments in himself, whilst he sleeps soundly, whether an hour or a day, a month or a year; of which duration of things, while he sleeps, or thinks not, he has no perception at all, but it is quite lost to him; and the moment wherein he leaves off to think, until the moment he begins to think again, seems to him to have no distance. And so I doubt not but it would be to a waking man, if it were possible for him to keep only one idea in his mind, without variation, and the succession of others; and we see, that one who fixes his thoughts very intently on one thing, so as to take but little notice of the succession of ideas that pass in his mind, whilst he is taken up with that earnest contemplation, lets slip out of his account a good part of that duration, and thinks that time shorter than it is. But if sleep commonly unites the distant parts of duration, it is because, during that time, we have no succession of ideas in our minds. For, if a man, during his sleep, dreams, and variety of ideas make themselves perceptible in his mind one after another, he hath, then, during such a dreaming, a sense of duration, and of the length of it. By which it is to me very clear, that men derive their ideas of duration from their reflections on the train of the ideas they observe to succeed one another in their own understandings; without which observation, they can have no notion of duration, whatever may happen in the world.

§ 5. *The idea of duration applicable to things whilst we sleep.*—Indeed, a man having, from reflecting on the succession and number of his own thoughts, got the notion or idea of duration, he can apply that notion to things which exist while he does not think; as he that has got the idea of extension from bodies by his sight or touch, can apply it to distances, where no body is seen or felt. And, therefore, though a man has no perception of the length of duration, which passed whilst he slept or thought not, yet having observed the revolution of days and nights, and found the length of their duration to be, in appearance, regular and constant, he can, upon the supposition that that evolution has proceeded, after the same manner, whilst he was asleep, or thought not, as it used to do at other times; he can, I say, imagine and make allowance for the length of duration, whilst he slept. But Adam and Eve (when they were alone in the world) instead of their ordinary night's sleep, had passed the whole twenty-four hours in one continued sleep, the duration of that twenty-four hours had been irreversibly lost to them, and been for ever left out of their account of time.

§ 6. *The idea of succession not from motion.*—Thus by reflecting on the appearing of various ideas one after another in our understandings, we get the notion of succession; which if any one would think he did rather get from our observation of motion by our senses, he will, perhaps, be of my mind, when he considers, that even motion produces in his mind an idea of succession no otherwise than as it produces there a continued train of distinguishable ideas. For a man looking upon a body really moving, perceives yet no notion at all, unless that motion

produces a constant train of successive ideas, v. g. a man becalmed at sea, out of sight of land, in a fair day, may look on the sun, or sea, or ship, a whole hour together, and perceive no motion at all in either; though it be certain that two, and perhaps all of them, have moved, during that time, a great way; but as soon as he perceives either of them to have changed distance with some other body, as soon as this motion produces any new idea in him, then he perceives that there has been motion. But wherever a man is, with all things at rest about him, without perceiving any motion at all; if during this hour of quiet he has been thinking, he will perceive the various ideas of his own thoughts, in his own mind, appearing one after another, and thereby observe and find succession, where he could observe no motion.

§ 7. And this, I think, is the reason why motions very slow, though they are constant, are not perceived by us; because, in their remove from one sensible part towards another, their change of distance is so slow, that it causes no new ideas in us, but a good while one after another; and so not causing a constant train of new ideas to follow one another immediately in our minds, we have no perception of motion, which consisting in a constant succession, we cannot perceive that succession, without a constant succession of varying ideas arising from it.

§ 8. On the contrary, things that move so swift, as not to affect the senses distinctly with several distinguishable distances of their motion, and so cause not any train of ideas in the mind, are not also perceived to move. For any thing that moves round about in a circle, in less time than our ideas are wont to succeed one another in our minds, is not perceived to move; but seems to be a perfect entire circle of that matter or colour, and not a part of a circle in motion.

§ 9. *The train of ideas has a certain degree of quickness.*—Hence I leave it to others to judge, whether it be not probable, that our ideas do, whilst we are awake, succeed one another in our minds at certain distances, not much unlike the images in the inside of a lanthorn, turned round by the heat of a candle. This appearance of theirs in train, though, perhaps, it may be sometimes faster, and sometimes slower; yet, I guess, varies not very much in a waking man: there seem to be certain bounds to the quickness and slowness of the succession of those ideas one to another in our minds, beyond which they can neither delay nor hasten.

§ 10. The reason I have for this odd conjecture, is from observing, that in the impressions made upon any one of our senses, we can, but to a certain degree, perceive any succession; which if exceeding quick, the sense of succession is lost, even in cases where it is evident that there is a real succession. Let a cannon bullet pass through a room and in its way take with it any limb, or fleshy parts of a man; it is as clear as any demonstration can be, that it must strike successively the two sides of the room. It is also evident, that it must touch one part of the flesh first, and another after, and so in succession: and yet, believe, nobody, who ever felt the pain of such a shot, or heard the blow against the two distant walls, could perceive any succession, either in the pain or sound of so swift a stroke. Such a part of duration as this, wherein we perceive no succession, is that which we call an in-

stant; and is that which takes up the time of only one idea in our minds, without the succession of another, wherein, therefore, we perceive no succession at all.

§ 11. This also happens where the motion is so slow, as not to supply a constant train of fresh ideas to the senses, as fast as the mind is capable of receiving new ones into it; and so other ideas of our own thoughts, having room to come into our minds, between those offered to our senses by the moving body, there the sense of motion is lost; and the body, though it really moves, yet not changing perceivable distance with some other bodies, as fast as the ideas of our own minds do naturally follow one another in train, the thing seems to stand still, as is evident in the hands of clocks, and shadows of sun-dials, and other constant, but slow, motions, where, though after certain intervals, we perceive, by the change of distance, that it hath moved, yet the motion itself we perceive not.

§ 12. *This train, the measure of other successions.*—So that to me it seems, that the constant and regular successions of ideas in a waking man, is, as it were, the measure and standard of all other successions, whereof, if any one either exceeds the pace of our ideas, as where two sounds or pains, &c. take up in their succession the duration of but one idea, or else where any motion or succession is so slow, as that it keeps not pace with the ideas in our minds, or the quickness in which they take their turns; as when any one or more ideas, in their ordinary course, come into our mind between those which are offered to the sight by the different perceptible distances of a body in motion, or between sounds or smells following one another; there, also, the sense of a constant continued succession is lost, and we perceive it not, but with certain gaps of rest between.

§ 13. *The mind cannot fix long on one invariable idea.*—If it be so, that the ideas of our minds, whilst we have any there, do constantly change and shift in a continual succession, it would be impossible, may any one say, for a man to think long of any one thing; by which, if it be meant, that a man may have one self-same single idea a long time alone in his mind, without any variation at all, I think, in matter of fact, it is not possible, for which (not knowing how the ideas of our minds are framed, of what materials they are made, whence they have their light, and how they come to make their appearances) I can give no other reason but experience; and I would have any one try whether he can keep one unvaried single idea in his mind, without any other, for any considerable time together.

§ 14. For trial, let him take any figure, any degree of light, or whiteness, or what other he pleases; and he will, I suppose, find it difficult to keep all other ideas out of his mind; but that some, either of another kind, or various considerations of that idea (each of which considerations is a new idea), will constantly succeed one another in his thoughts, let him be as wary as he can.

§ 15. All that is in a man's power in this case, I think, is only to mind and observe what the ideas are, that take their turns in his understanding; or else to direct the sort, and call in such as he hath a desire or use of: but hinder the constant succession of fresh ones, I think he

cannot, though he may commonly choose, whether he will heedfully observe and consider them.

§ 16. *Ideas, however made, include no sense of motion.*—Whether these several ideas in a man's mind be made by certain motions, I will not here dispute; but this I am sure, that they include no idea of motion in their appearance; and if a man had not the idea of motion otherwise, I think he would have none at all, which is enough to my present purpose, and sufficiently shews, that the notice we take of the ideas of our miuds appearing there one after another, is that which gives us the idea of succession and duration, without which, we should have no such ideas at all. It is not then motion, but the constant train of ideas in our minds whilst we are waking, that furnishes us with the idea of duration, whereof motion no otherwise gives us any perception, than as it causes in our minds a constant succession of ideas, as I have before shewn: and we have as clear an idea of succession and duration, by the train of other ideas succeeding one another in our minds, without the idea of any motion, as by the train of ideas caused by the uninterrupted sensible change of distance between two bodies, which we have from motion; and, therefore, we should as well have the idea of duration, were there no sense of motion at all.

§ 17. *Time is duration set out by measures.*—Having thus got the idea of duration, the next thing natural for the mind to do, is, to get some measure of this common duration, whereby it might judge of its different lengths, and consider the distinct order wherein several things exist, without which, a great part of our knowledge would be confused, and a great part of history be rendered very useless. This consideration of duration, as set out by certain periods, and marked by certain measures or epochs, is that, I think, which most properly we call time.

§ 18. *A good measure of time must divide its whole duration into equal periods.*—In the measuring of extension, there is nothing more required but the application of the standard or measure we make use of, to the thing of whose extension we would be informed. But in the measuring of duration, this cannot be done, because no two different parts of succession can be put together to measure one another; and nothing being a measure of duration but duration, as nothing is of extension but extension, we cannot keep by us any standing unvarying measure of duration, which consists in a constant fleeting succession, as we can of certain lengths of extensions, as inches, feet, yards, &c., marked out in permanent parcels of matter. Nothing then could serve well for a convenient measure of time, but what has divided the whole length of its duration into apparently equal portions, by constantly repeated periods. What portions of duration are not distinguished, or considered as distinguished and measured by such periods, come not so properly under the notion of time, as appears by such phrases as these, viz. “Before all time,” and “when time shall be no more.”

§ 19. *The revolutions of the sun and moon the properest measures of time.*—The diurnal and annual revolutions of the sun, as having been, from the beginning of nature, constant, regular, and universally observable by all mankind, and supposed equal to one another, have been

with reason made use of for the measure of duration. But the distinction of days and years, having depended on the motion of the sun, it has brought this mistake with it, that it has been thought that motion and duration were the measure one of another: for men, in the measuring of the length of time, having been accustomed to the ideas of minutes, hours, days, months, years, &c. which they found themselves, upon any mention of time or duration, presently to think on, all which portions of time were measured out by the motion of those heavenly bodies: they were apt to confound time and motion, or at least to think that they had a necessary connexion one with another: whereas any constant periodical appearance or alteration of ideas in seemingly equidistant spaces of duration, if constantly and universally observable, would have as well distinguished the intervals of time, as those that have been made use of. For, supposing the sun, which some have taken to be a fire, had been lighted up at the same distance of time that it now every day comes about to the same meridian, and then gone out again about twelve hours after, and that, in the space of an annual revolution, it had sensibly increased in brightness and heat, and so decreased again; would not such regular appearances serve to measure out the distances of duration to all that could observe it, as well without, as with, motion? for if the appearances were constant, universally observable, and in equidistant periods, they would serve mankind for measure of time as well, were the motion away.

§ 20. *But not by their motion, but periodical appearances.*—For the freezing of water, or the blowing of a plant, returning at equidistant periods in all parts of the earth, would as well serve men to reckon their years by, as the motions of the sun. And, in effect, we see that some people in America counted their years by the coming of certain birds amongst them at their certain seasons, and leaving them at others. For a fit of an ague, the sense of hunger or thirst, a smell, or a taste, or any other idea, returning constantly at equidistant periods, and making itself universally be taken notice of, would not fail to measure out the course of succession, and distinguish the distances of time. Thus we see, that men, born blind, count time well enough by years, whose revolutions yet they cannot distinguish by motions that they perceive not. And I ask, whether a blind man, who distinguished his years either by heat of summer, or cold of winter; by the smell of any flower of the spring, or taste of any fruit of the autumn, would not have a better measure of time than the Romans had before the reformation of their Calendar by Julius Cæsar; or many other people, whose years, notwithstanding the motion of the sun, which they pretend to make use of, are very irregular? And it adds no small difficulty to chronology, that the exact regular lengths of the years that several nations counted by, are hard to be known, they differing very much one from another, and I think I may say all of them from the precise motion of the sun. And if the sun moved from the creation to the flood, constantly in the equator, and so equally dispersed its light and heat to all the habitable parts of the earth, in days all of the same length, without its annual variations to the tropics, as a late ingenious author supposes,* I do not

* Dr. Burnet's Theory of the Earth.

think it very easy to imagine, that (notwithstanding the motion of the sun) men should, in the antediluvian world, from the beginning, count by years, or measure their time by periods, that had no sensible marks very obvious to distinguish them by.

§ 21. *No two parts of duration can be certainly known to be equal.*—But perhaps it will be said, without a regular motion, such as of the sun, or some other, how could it ever be known that such periods were equal? To which I answer: The equality of any other returning appearances might be known by the same way that that of days was known, or presumed to be so at first; which was only by judging of them by the train of ideas which had passed in men's minds in the intervals, by which train of ideas discovering inequality in the natural days, but none in the artificial days, the artificial days, or *ηυχθήμερα*, were guessed to be equal, which was sufficient to make them serve for a measure: though exacter search has since discovered inequality in the diurnal revolutions of the sun, and we know not whether the annual also be not unequal; these yet, by their presumed and apparent equality, serve as well to reckon time by (though not to measure the parts of duration exactly), as if they could be proved to be exactly equal. We must, therefore, carefully distinguish betwixt duration itself, and the measures we make use of to judge of its length. Duration in itself, is to be considered as going on in one constant, equal, uniform course: but none of the measures of it, which we make use of, can be known to do so; nor can we be assured, that their assigned parts or periods are equal in duration one to another; for two successive lengths of duration, however measured, can never be demonstrated to be equal. The motion of the sun, which the world used so long, and so confidently, for an exact measure of duration, has, as I said, been found in its several parts unequal: and though men have of late made use of a pendulum, as a more steady and regular motion than that of the sun, or (to speak more truly) of the earth; yet if any one should be asked how he certainly knows that the two successive swings of a pendulum are equal, it would be very hard to satisfy himself, that they are infallibly so. Since we cannot be sure that the cause of that motion, which is unknown to us, shall always operate equally; and we are sure that the medium in which the pendulum moves, is not constantly the same: either of which varying, may alter the equality of such periods, and thereby destroy the certainty and exactness of the measure by motion, as well as any other periods of other appearances; the notion of duration still remaining clear, though our measures of it cannot any of them be demonstrated to be exact. Since, then, no two portions of succession can be brought together, it is impossible ever certainly to know their equality. All that we can do for a measure of time, is to take such as have continual successive appearances at seeming equidistant periods; of which seeming equality, we have no other measure, but such as the train of our own ideas have lodged in our memories, with the concurrence of other probable reasons, to persuade us of their equality.

§ 22. *Time not the measure of motion.*—One thing seems strange to me, that whilst all men manifestly measured time by the motion of the great and visible bodies of the world, time yet should be defined to

be the measure of motion : whereas it is obvious to every one who reflects ever so little on it, that to measure motion, space is as necessary to be considered as time ; and those who look a little farther, will find also the bulk of the thing moved, necessary to be taken into the computation by any one who will estimate or measure motion, so as to judge right of it. Nor, indeed, does motion any otherwise conduce to the measuring of duration, than as it constantly brings about the return of certain sensible ideas, in seeming equidistant periods. For if the motion of the sun were as unequal as of a ship driven by unsteady winds, sometimes very slow, and at others, irregularly very swift ; or if being equally swift, it yet was not circular, and produced not the same appearances, it would not at all help us to measure time, any more than the seeming unequal motion of a comet does.

§ 23. *Minutes, hours, days, and years, not necessary measures of duration.*—Minutes, hours, days, and years, are then no more necessary to time or duration, than inches, feet, yards, and miles, marked out in any matter, are to extension. For though we, in this part of the universe, by the constant use of them, as of periods set out by the revolutions of the sun, or as known parts of such periods, have fixed the ideas of such lengths of duration in our minds, which we apply to all parts of time, whose lengths we should consider ; yet there may be other parts of the universe, where they no more use these measures of ours, than in Japan they do our inches, feet, or miles. But yet something analogous to them, there must be ; for without some regular periodical returns, we could not measure ourselves, or signify to others the length of any duration, though, at the same time, the world were as full of motion as it is now, but no part of it disposed into regular and apparently equidistant revolutions. But the different measures that may be made use of for the account of time, do not at all alter the notion of duration, which is the thing to be measured, no more than the different standards of a foot and a cubit, alter the notion of extension to those who make use of those different measures.

§ 24. *One measure of time applicable to duration before time.*—The mind having once got such a measure of time, as the annual revolution of the sun, can apply that measure to duration, wherein that measure itself did not exist, and with which, in the reality of its being, it had nothing to do : for should one say, that Abraham was born in the year 2712 year of the Julian period, it is altogether as intelligible, as reckoning from the beginning of the world, though there were so far back no motion of the sun, nor any motion at all. For though the Julian period be supposed to begin several hundred years before there were really either days, nights, or years, marked out by any revolutions of the sun, yet we reckon as right, and thereby measure durations as well, as if really at that time the sun had existed, and kept the same ordinary motion it doth now. The idea of duration equal to an annual revolution of the sun, is as easily applicable in our thoughts to duration, where no sun nor motion was, as the idea of a foot or yard taken from bodies here, can be applied in our thoughts to distances beyond the confines of the world, where are no bodies at all.

§ 25. For supposing it were 5639 miles, or millions of miles, from this place to the remotest body of the universe (for being finite, it must be at a certain distance), as we suppose it to be 5639 years from this time to the first existence of any body in the beginning of the world, we can, in our thoughts, apply this measure of a year to duration before the creation, or beyond the duration of bodies or motion, as we can this measure of a mile to space beyond the utmost bodies; and by the one, measure duration, where there was no motion; as well as by the other, measure space in our thoughts, where there is no body.

§ 26. If it be objected to me here, that in this way of explaining of time, I have begged what I should not, viz. that the world is neither eternal nor infinite; I answer, that to my present purpose, it is not needful, in this place, to make use of arguments to evince the world to be finite, both in duration and extension; but it being, at least, as conceivable as the contrary, I have certainly the liberty to suppose it, as well as any one hath to suppose the contrary; and I doubt not but that every one that will go about it, may easily conceive in his mind the beginning of motion, though not of all duration; and so may come to a stop, and *non ultra*, in his consideration of motion; so, also, in his thoughts, he may set limits to body, and the extension belonging to it; but not to space, where no body is, the utmost bounds of space and duration being beyond the reach of thought, as well as the utmost bounds of number are beyond the largest comprehension of the mind, and all for the same reason, as we shall see in another place.

§ 27. *Eternity*.—By the same means, therefore, and from the same original that we come to have the idea of time, we have also that idea which we call eternity, viz., having got the idea of succession and duration, by reflecting on the train of our own ideas, caused in us either by the natural appearances of those ideas coming constantly of themselves into our waking thoughts, or else caused by external objects successively affecting our senses; and having, from the revolutions of the sun, got the ideas of certain lengths of duration, we can, in our thoughts, add such lengths of duration to one another, as often as we please, and apply them, so added, to durations past or to come: and this we can continue to do on, without bounds or limits, and proceed *in infinitum*, and apply thus the length of the annual motion of the sun to duration, supposed before the sun's, or any other, motion had its being; which is no more difficult or absurd, than to apply the notion I have of the moving of a shadow, one hour to-day upon the sundial, to the duration of something last night; v. g. the burning of a candle, which is now absolutely separate from all actual motion; and it is as impossible for the duration of that flame for an hour last night, to co-exist with any motion that now is, or for ever shall be, as for any part of duration, that was before the beginning of the world, to co-exist with the motion of the sun now. But yet this hinders not, but that having the idea of the length of the motion of the shadow on a dial between the marks of two hours, I can as distinctly measure in my thoughts the duration of that candle-light last night, as I can the duration of any thing that does now exist. And it is no more than to think, that had the sun shone

then on the dial, and moved after the same rate it doth now, the shadow on the dial would have passed from one hour-line to another, whilst that flame of the candle lasted.

§ 28. The notion of an hour, day, or year, being only the idea I have of the length of certain periodical regular motions, neither of which motions do ever all at once exist, but only of the ideas I have of them in my memory, derived from my senses or reflection, I can with the same ease, and for the same reason, apply it in my thoughts to duration antecedent to all manner of motion, as well as to any thing that is but a minute or a day antecedent to the motion that at this very moment the sun is in. All things past, are equally and perfectly at rest; and to this way of consideration of them are all one, whether they were before the beginning of the world, or but yesterday; the measuring of any duration by some motion, depending not at all on the real co-existence of that thing to that motion, or any other periods of revolution, but the having a clear idea of the length of some periodical known motion, or other intervals of duration of my mind, and applying that to the duration of the thing I would measure.

§ 29. Hence we see, that some men imagine the duration of the world from its first existence, to this present year 1689, to have been 5639 years, or equal to 5639 annual revolutions of the sun; and others a great deal more, as the Egyptians of old, who, in the time of Alexander, counted 23,000 years from the reign of the sun; and the Chinese now, who account the world 3,269,000 years old, or more; which longer duration of the world, according to their computation, though I should not believe it to be true, yet I can equally imagine it with them, and as truly understand and say one is longer than the other, as I understand that Methusalem's life was longer than Enoch's: and if the common reckoning of 5639 should be true (as it may be, as well as any other assigned), it hinders not at all my imagining what others mean, when they make the world 1000 years older, since every one may, with the same facility, imagine (I do not say believe) the world to be 50,000 years old, as 5639; and may as well conceive the duration of 50,000 years, as 5639. Whereby it appears, that to the measuring the duration of any thing by time, it is not requisite that that thing should be co-existent to the motion we measure by, or any other periodical revolution; but it suffices to this purpose, that we have the idea of the length of any regular periodical appearance, which we can in our minds apply to duration, with which the motion or appearance never co-existed.

§ 30. For as in the history of the creation delivered by Moses, I can imagine that light existed three days before the sun was, or had any motion, barely by thinking that the duration of light before the sun was created, was so long as (if the sun had moved then as it doth now) would have been equal to three of his diurnal revolutions; so, by the same way, I can have an idea of the chaos or angels being created before there was either light or any continued motion, a minute, an hour, a day, a year, or 1000 years. For if I can but consider duration equal to one minute, before either the being or motion of any body, I can add one minute more till I come to 60: and by the same way of add-

ing minutes, hours, or years (i. e. such or such parts of the sun's revolutions, or any other period, whereof I have the idea), proceed *in infinitum*, and suppose a duration exceeding as many such periods as I can reckon, let me add whilst I will, which I think is the notion we have of eternity, of whose infinity we have no other notion than we have of the infinity of number, to which we can add for ever without end

§ 31. And thus I think it is plain, that from those two fountains of all knowledge before-mentioned, viz., reflection and sensation, we get the ideas of duration, and the measures of it.

For, *First*, By observing what passes in our minds, how our ideas there in train constantly some vanish, and others begin to appear, we come by the idea of succession.

Secondly, By observing a distance in the parts of this succession, we get the idea of duration.

Thirdly, By sensation, observing certain appearances at certain regular and seeming equidistant periods, we get the ideas of certain lengths or measures of duration, as minutes, hours, days, years, &c.

Fourthly, By being able to repeat those measures of time, or ideas of stated length of duration in our minds, as often as we will, we can come to imagine duration, where nothing does really endure or exist; and thus we imagine to-morrow, next year, or seven years hence.

Fifthly, By being able to repeat ideas of any length of time, as of a minute, a year, or an age, as often as we will in our own thoughts, and adding them one to another, without ever coming to the end of such addition, any nearer than we can to the end of number, to which we can always add, we come by the idea of eternity, as the future eternal duration of our souls, as well as the eternity of that infinite being, which must necessarily have always existed.

Sixthly, By considering any part of infinite duration, as set out by periodical measures, we come by the idea of what we call time in general.

CHAP. XV.

OF DURATION AND EXPANSION, CONSIDERED TOGETHER.

§ 1. *Both capable of greater and less.*—Though we have in the precedent chapters dwelt pretty long on the considerations of space and duration; yet they being ideas of general concernment, that have something very abstruse and peculiar in their nature, the comparing them one with another, may, perhaps, be of use for their illustration; and we may have the more clear and distinct conception of them, by taking a view of them together. Distance or space, in its simple abstract conception, to avoid confusion, I call expansion, to distinguish it from extension, which by some is used to express this distance only as it is in the solid parts of matter, and so includes, or at least intimates, the idea of body: whereas the idea of pure distance includes no such thing, I prefer also the word expansion to space, because space is often applied to distance of fleeting successive parts, which never exist together, as well as to those which are permanent. In both these (viz. ex-

pansion and duration), the mind has this common idea of continued lengths, capable of greater or less quantities : for a man has as clear an idea of the difference of the length of an hour and a day, as of an inch and a foot.

§ 2. *Expansion not bounded by matter.*—The mind, having got the idea of the length of any part of expansion, let it be a span, or a pace, or what length you will, can, as has been said, repeat that idea ; and so adding it to the former, enlarge its idea of length, and make it equal to two spans, or two paces, and so, as often as it will, till it equals the distance of any parts of the earth one from another, and increase thus, until it amounts to the distance of the sun, or remotest star. By such a progression as this, setting out from the place where it is, or any other place, it can proceed and pass beyond all those lengths, and find nothing to stop it going on, either in or without body. It is true, we can easily, in our thoughts, come to the end of solid extension ; the extremity and bounds of all body, we have no difficulty to arrive at ; but when the mind is there, it finds nothing to hinder its progress into this endless expansion ; of that it can neither find nor conceive any end. Nor let any one say, that beyond the bounds of body there is nothing at all, unless he will confine God within the limits of matter. Solomon, whose understanding was filled and enlarged with wisdom, seems to have other thoughts, when he says, “Heaven, and the heaven of heavens, cannot contain thee ;” and he, I think, very much magnifies to himself the capacity of his own understanding, who persuades himself, that he can extend his thoughts farther than God exists, or imagine any expansion where he is not.

§ 3. *Nor duration by motion.*—Just so is it in duration ; the mind having got the idea of any length of duration, can double, multiply, and enlarge it, not only beyond its own, but beyond the existence of all corporeal beings, and all the measures of time taken from the great bodies of the world, and their motions. But yet every one easily admits, that though we make duration boundless, as certainly it is, we cannot yet extend it beyond all being. God, every one easily allows, fills eternity ; and it is hard to find a reason, why any one should doubt that he likewise fills immensity. His infinite being is certainly as boundless one way as another ; and methinks it ascribes a little too much to matter, to say, where there is no body, there is nothing.

§ 4. *Why men more easily admit infinite duration, than infinite expansion.*—Hence, I think, we may learn the reason why every one familiarly, and without the least hesitation, speaks of, and supposes, eternity, and sticks not to ascribe infinity to duration ; but it is with more doubting and reserve, that many admit, or suppose, the infinity of space. The reason whereof seems to me to be this ; that duration and extension being used as names of affections belonging to other beings, we easily conceive in God infinite duration, and we cannot avoid doing so ; but not attributing to him extension, but only to matter, which is finite, we are apter to doubt of the existence of expansion without matter, of which alone we commonly suppose it an attribute. And, therefore, when men pursue their thoughts of space, they are apt to stop at the confines of body, as if space were there at an end too, and

reached no farther. Or if their ideas, upon consideration, carry them farther, yet they term what is beyond the limits of the universe, imaginary space; as if it were nothing, because there is no body existing in it. Whereas, duration, antecedent to all body, and to the motions which it is measured by, they never term imaginary; because it is never supposed void of some other real existence. And if the names of things may at all direct our thoughts towards the originals of men's ideas (as I am apt to think they may very much), one may have occasion to think, by the name duration, that the continuation of existence, with a kind of resistance to any destructive force, and the continuation of solidity (which is apt to be confounded with, and if we will look into the minute anatomical parts of matter, is little different from hardness), were thought to have some analogy, and gave occasion to words so near of kin, as *durare* and *durum esse*. And that *durare* is applied to the idea of hardness, as well as that of existence, we see in Horace, *epod.* 16. *ferro duravit secula*. But be that as it will, this is certain, that whoever pursues his own thoughts, will find them sometimes launch out beyond the extent of body, into the infinity of space or expansion; the idea whereof is distinct and separate from body, and all other things: which may (to those who please) be a subject of farther meditation.

§ 5. *Time to duration, is as place to expansion.*—Time in general is to duration, as place to expansion. They are so much of those boundless oceans of eternity and immensity, as is set out and distinguished from the rest, as it were, by land-marks; and so are made use of, to denote the position of finite real beings, in respect one to another, in those uniform infinite oceans of duration and space. These rightly considered, are only ideas of determinate distances from certain known points fixed in distinguishable sensible things, and supposed to keep the same distance one from another. From such points, fixed in sensible beings, we reckon, and from them we measure our portions of those infinite quantities; which so considered, are that which we call time and place. For duration and space being in themselves uniform and boundless, the order and position of things, without such known settled points, would be lost in them; and all things would lie jumbled in an incurable confusion.

§ 6. *Time and place are taken for so much of either, as are set out by the existence and motion of bodies.*—Time and place taken thus for determinate distinguishable portions of those infinite abysses of space and duration, set out or supposed to be distinguished from the rest by marks and known boundaries, have each of them a two-fold acceptation.

First, Time in general is commonly taken for so much of infinite duration, as is measured by, and co-existent with, the existence and motions of the great bodies of the universe, as far as we know any thing of them: and in this sense, time begins and ends with the frame of this sensible world, as in these phrases before-mentioned, before all time, or when time shall be no more. Place likewise is taken sometimes for that portion of infinite space, which is possessed by, and comprehended within, the material world; and is thereby distinguished from the rest of expansion, though this may more properly be called exten-

sion than place. Within these two are confined, and by the observable parts of them are measured and determined, the particular time or duration, and the particular extension and place, of all corporeal beings.

§ 7. *Sometimes for so much of either, as we design by measures taken from the bulk or motion of bodies.*—*Secondly*, Sometimes the word time is used in a larger sense, and is applied to parts of that infinite duration, not that were really distinguished and measured out by this real existence, and periodical motions of bodies, that were appointed from the beginning to be for signs and for seasons, and for days and years, and are accordingly our measures of time; but such other portions too of that infinite uniform duration, which we, upon any occasion, do suppose equal to certain lengths of measured time; and so consider them as bounded and determined. For if we should suppose the creation, or fall, of the angels, was at the beginning of the Julian period, we should speak properly enough; and should be understood, if we said, it is a longer time since the creation of angels, than the creation of the world, by seven thousand, six hundred, and forty years: whereby we would mark out so much of that distinguished duration, as we suppose equal to, and would have admitted, seven thousand, six hundred, and forty annual revolutions, of the sun, moving at the rate it now does. And thus likewise we sometimes speak of place, distance, or bulk, in the great inane beyond the confines of the world, when we consider so much of that space as is equal to, or capable to, receive a body of any assigned dimensions, as a cubic foot; or do suppose a point in it, at such a certain distance from any part of the universe.

§ 8. *They belong to all beings.*—Where and when are questions belonging to all finite existences, and are by us always reckoned from some known parts of this sensible world, and from some certain epochs marked out to us by the motions observable in it. Without some such fixed parts or periods, the order of things would be lost to our finite understandings, in the boundless invariable oceans of duration and expansion; which comprehend in them all finite beings, and in their full extent, belong only to the Deity. And, therefore, we are not to wonder, that we comprehend them not, and do so often find our thoughts at a loss, when we would consider them, either abstractly in themselves, or as any way attributed to the first incomprehensible being. But when applied to any particular finite beings, the extension of any body is so much of that infinite space, as the bulk of the body takes up. And place is the position of any body, when considered at a certain distance from some other. As the idea of the particular duration of any thing, is an idea of that portion of infinite duration, which passes during the existence of that thing; so the time when the thing existed, is the idea of that space of duration, which passed between some known and fixed period of duration, and the being of that thing. One shews the distance of the extremities of the bulk, or existence of the same thing, as that it is a foot square, or lasted two years; the other shews the distance of it in place, or existence, from other fixed points of space of duration; as that it was in the middle of Lincoln's Inn Fields, or the first degree of Taurus, and in the year of our Lord, 1671, or the 1000 year of the Julian period: all which distances we measure by precon-

ceived ideas of certain lengths of space and duration, as inches, feet, miles, and degrees; and in the other, minutes, days, and years.

§ 9. *All the parts of extension, are extension; and all the parts of duration, are duration.*—There is one thing more, wherein space and duration have a great conformity, and that is; though they are justly reckoned amongst our simple ideas; yet none of the distinct ideas we have of either, is without all manner of composition;* it is the very nature of both of them to consist of parts: but their parts being all of the same kind, and without the mixture of any other idea, hinder them not from having a place amongst simple ideas. Could the mind, as in number, come to so small a part of extension or duration, as excluded divisibility, that would be, as it were, the indivisible unit, or idea; by repetition of which, it would make its more enlarged ideas of extension and duration. But since the mind is not able to frame an idea of any space without parts, instead thereof it makes use of the common measures, which, by familiar use, in each country, have imprinted themselves on the memory (as inches and feet; or cubits and parasangs; and so seconds, minutes, hours, days, and years in duration): the mind makes use, I say, of such ideas as these, as simple ones; and these are

* It has been objected to Mr. Locke, that if space consists of parts, as it is confessed in this place, he should not have reckoned it in the number of simple ideas: because it seems to be inconsistent with what he says elsewhere, that a simple idea is uncompounded, and contains in it nothing but one uniform appearance or conception of the mind, and is not distinguishable into different ideas. It is farther objected, that Mr. Locke has not given in the eleventh chapter of the second book, where he begins to speak of simple ideas, an exact definition of what he understands by the word simple ideas. To these difficulties, Mr. Locke answers thus: To begin with the last, he declares, that he has not treated his subject in an order perfectly scholastic, having not had much familiarity with those sort of books during the writing of his, and not remembering at all the method in which they are written; and, therefore, his readers ought not to expect definitions regularly placed at the beginning of each new subject. Mr. Locke contents himself to employ the principal terms that he uses, so that from his use of them, the reader may easily comprehend what he means by them. But with respect to the term simple idea, he has had the good luck to define that in the place cited in the objection; and, therefore, there is no reason to supply that defect. The question then is to know, whether the idea of extension agrees with this definition? which will effectually agree to it, if it be understood in the sense which Mr. Locke had principally in his view: for that composition which he designed to exclude in that definition, was a composition of different ideas in the mind, and not a composition of the same kind in a thing whose essence consists in having parts of the same kind, where you can never come to a part entirely exempted from this composition. So that if the idea of extension consists in having *partes extra partes* (as the schools speak), it is always, in the sense of Mr. Locke, a simple idea; because the idea of having *partes extra partes*, cannot be resolved into two other ideas. For the remainder of the objection made to Mr. Locke, with respect to the nature of extension, Mr. Locke was aware of it, as may be seen in § 9. chap. 15. of the second book, where he says, that “the least portion of space or extension, whereof we have a clear and distinct idea, may perhaps be the fittest to be considered by us as a simple idea of that kind, out of which our complex modes of space and extension are made up.” So that, according to Mr. Locke, it may very fitly be called a simple idea, since it is the least idea of space that the mind can form to itself, and that cannot be divided by the mind into any less, whereof it has in itself any determined perception. From whence it follows, that it is to the mind one simple idea; and that is sufficient to take away this objection: for it is not the design of Mr. Locke, in this place, to discourse of any thing but concerning the idea of the mind. But if this is not sufficient to clear the difficulty, Mr. Locke hath nothing more to add, but that the idea of extension is so peculiar, that it cannot exactly agree with the definition that he has given of those simple ideas, so that it differs in some manner from all others of that kind, he thinks it is better to leave it there exposed to this difficulty, than to make a new division in his favour. It is enough for Mr. Locke, that his meaning can be understood. It is very common to observe intelligible discourses, spoiled by too much subtilty in nice divisions. We ought to put things together as well as we can, *doctrinæ causa*; but after all, several things will not be bundled up together under our terms and ways of speaking.

the component parts of larger ideas, which the mind, upon occasion, makes by the addition of such known lengths, which it is acquainted with. On the other side, the ordinary smallest measure we have of either, is looked on as an unit in number, when the mind, by division, would reduce them into less fractions. Though on both sides, both in addition and division, either space or duration, when the idea under consideration becomes very big, or very small, its precise bulk becomes very obscure and confused; and it is the number of its repeated additions, or divisions, that alone remains clear and distinct, as will easily appear to any one, who will let his thoughts loose in the vast expansion of space, or divisibility of matter. Every part of duration, is duration too; and every part of extension, is extension, both of them capable of addition or division *in infinitum*. But the least portions of either of them, whereof we have clear and distinct ideas, may perhaps be fittest to be considered by us, as the simple ideas of that kind, out of which our complex modes of space, extension, and duration, are made up, and into which they can again be distinctly resolved. Such a small part of duration, may be called a moment, and is the time of one idea in our minds, in the train of their ordinary succession there. The other, wanting a proper name, I know not whether I may be allowed to call a sensible point, meaning thereby the least particle of matter or space we can discern, which is ordinarily about a minute, and to the sharpest eyes, seldom less than thirty seconds of a circle, whereof the eye is the centre.

§ 10. *Their parts inseparable.*—Expansion and duration have this farther agreement, that though they are both considered by us as having parts, yet their parts are not separable one from another, no not even in thought; though the parts of bodies, from whence we take our measure of the one, and the parts of motion, or rather a succession of ideas in our minds, from whence we take the measure of the other, may be interrupted and separated; as the one is often by rest, and the other is by sleep, which we call rest too.

§ 11. *Duration is as a line, expansion as a solid.*—But yet there is this manifest difference between them, and the ideas of length, which we have of expansion, are turned every way, and so make figure, and breadth, and thickness; but duration is but as it were the length of one straight line, extended *in infinitum*, not capable of multiplicity, variation, or figure; but is one common measure of all existence whatsoever, wherein all things, whilst they exist, equally partake. For this present moment is common to all things that are now in being, and equally comprehends that part of their existence, as much as if they were all but one single being; and we may truly say, they all exist in the same moment of time. Whether angels and spirits have any analogy to this, in respect to expansion, is beyond my comprehension; and, perhaps, for us, who have understandings and comprehensions suited to our own preservation, and the ends of our own being, but not to the reality and extent of all other beings, it is near as hard to conceive any existence, or to have any idea of any real being, with a perfect negation of all manner of expansion; as it is to have the idea of any real existence, with a perfect negation of all manner of duration. And, therefore,

what spirits have to do with space, or how they communicate in it, we know not. All that we know is, that bodies do each singly possess its proper portion of it, according to the extent of solid parts; and thereby exclude all other bodies from having any share in that particular portion of space, whilst it remains there.

§ 12. *Duration has never two parts together, expansion altogether.*—Duration, and time, which is a part of it, is the idea we have of perishing distance, of which no two parts exist together, but follow each other in succession; as expansion is the idea of lasting distance, all whose parts exist together, and are not capable of succession. And, therefore, though we cannot conceive any duration without succession, nor put it together in our thoughts, that any being does now exist to-morrow, or possess at once more than the present moment of duration; yet we can conceive the eternal duration of the Almighty far different from that of man, or any other finite being. Because man comprehends not in his knowledge or power, all past and future things; his thoughts are but of yesterday, and he knows not what to-morrow will bring forth. What is once passed, he can never recal; and what is yet to come, he cannot make present. What I say of man, I say of all finite beings, who, though they may far exceed man in knowledge and power, yet are no more than the meanest creature, in comparison with God himself. Finite, of any magnitude, holds not any proportion to infinite. God's infinite duration being accompanied with infinite knowledge and infinite power he sees all things past and to come; and they are no more distant from his knowledge, no farther removed from his sight, than the present; they all lie under the same view; and there is nothing which he cannot make exist each moment he pleases. For the existence of all things depending upon his good pleasure, all things exist every moment that he thinks fit to have them exist. To conclude: expansion and duration do mutually embrace and comprehend each other; every part of space being in every part of duration; and every part of duration in every part of expansion. Such a combination of two distinct ideas, is, I suppose, scarce to be found in all that great variety we do or can conceive, and may afford matter to farther speculation.

CHAP. XVI.

OF NUMBER.

§ 1. *Number, the simplest and most universal idea.*—Amongst all the ideas we have, as there is none suggested to the mind by more ways, so there is none more simple, than that of unity, or one. It has no shadow of variety or composition in it; every object our senses are employed about; every idea in our understandings; every thought of our minds, bring this idea along with it. And, therefore, it is the most intimate to our thoughts, as well as it is in its agreement to all other things, the most universal idea we have. For number applies itself to men, angels, actions, thoughts, every thing that either doth exist, or can be imagined.

§ 2. *Its modes made by addition.*—By repeating this idea in our

minds, and adding the repetitions together, we come by the complex ideas of the modes of it. Thus by adding one to one, we have the complex idea of a couple; but putting twelve units together, we have the complex idea of a dozen; and so of a score, or a million, or any other number.

§ 3. *Each mode distinct.*—The simple modes of numbers are of all other the most distinct; every the least variation, which is an unit, making each combination as clearly different from that which approacheth nearest to it, as the most remote; two being as distinct from one, as two hundred; and the idea of two, as distinct from the idea of three, as the magnitude of the whole earth, is from that of a mite. This is not so in other simple modes, in which it is not so easy, nor perhaps possible, for us to distinguish betwixt two approaching ideas, which yet are really different. For who will undertake to find a difference between the white of this paper, and that of the next degree to it? Or can form distinct ideas of every the least excess in extension?

§ 4. *Therefore demonstrations in numbers the most precise.*—The clearness and distinctness of each mode of number from all others, even those that approach nearest, makes me apt to think, that demonstrations in numbers, if they are not more evident and exact than in extension, yet they are more general in their use, and more determinate in their application. Because the ideas of numbers are more precise and distinguishable than in extension, where every equality or excess are not so easy to be observed or measured; because our thoughts cannot in space arrive at any determined smallness, beyond which it cannot go, as an unit; and, therefore, the quantity or proportion of any the least excess cannot be discovered: which is clear otherwise in number; where, as has been said, ninety-one is as distinguishable from ninety, as from nine thousand, though ninety-one be the next immediate excess to ninety. But it is not so in extension, where whatsoever is more than just a foot, or an inch, is not distinguishable from the standard of a foot, or an inch; and in lines, which appear of an equal length, one may be longer than the other by innumerable parts; nor can any one assign an angle, which shall be the next biggest to a right one.

§ 5. *Names necessary to numbers.*—By the repeating, as has been said, of the idea of an unit, and joining it to another unit, we make thereof one collective idea, marked by the name two. And whosoever can do this, and proceed on, still adding one more to the last collective idea which he had of any number, and give a name to it, may count, or have ideas for, several collections of units, distinguished one from another, as far as he hath a series of names for following numbers, and a memory to retain that series, with their several numbers; all numeration being but still the adding of one unit more, and giving to the whole together, as comprehended in one idea, a new or distinct name or sign, whereby to know it from those before and after, and distinguish it from every smaller or greater multitude of units. So that he can add one to one, and so to two, and so go on with his tale, taking still with him the distinct names belonging to every progression; and so again, by subtracting an unit from each collection, retreat and lessen them, is capable of all the ideas of numbers within the compass of his language,

or for which he hath names, though not, perhaps, of more. For the several simple modes of numbers, being in our minds but so many combinations of units, which have no variety, nor are capable of any other difference but more or less, names or marks for each distinct combination seem more necessary than in any other sort of ideas. For without such names or marks, we can hardly well make use of numbers in reckoning, especially where the combination is made up of any great multitude of units; which put together without a name or mark, to distinguish that precise collection, will hardly be kept from being a heap in confusion.

§ 6. This I think to be the reason why some Americans I have spoken with (who were otherwise of quick and rational parts enough), could not, as we do, by any means, count to one thousand; nor had any distinct idea of that number, though they could reckon very well to twenty. Because their language being scanty, and accommodated only to the few necessaries of a needy simple life, unacquainted either with trade or mathematics, had no words in it to stand for one thousand; so that when they were discoursed with of those great numbers, they would shew the hairs of their head, to express a great multitude, which they could not number; which inability, I suppose, proceeded from their want of names. The Tououpinambos had no names for numbers above five; any number beyond that, they made out by shewing their fingers, and the fingers of others who were present.* And I doubt not but we ourselves might distinctly number in words, a great deal farther than we usually do, would we find out but some fit denominations to signify them by; whereas in the way we take now to name them, by millions of millions of millions, &c., it is hard to go beyond eighteen, or at most four-and-twenty, decimal progressions, without confusion. But to shew how much distinct names conduce to our well reckoning, or having useful ideas of numbers, let us set all these following figures in one continued line, as the marks of one number: v. g.

<i>Nonillions.</i>	<i>Octillions.</i>	<i>Septillions.</i>	<i>Sextillions.</i>	<i>Quintillions.</i>
857324.	162486.	345896.	437918.	423147.
<i>Quatrillions.</i>	<i>Trillions.</i>	<i>Billions.</i>	<i>Millions.</i>	<i>Units.</i>
248106.	235421.	261734.	368149.	623137.

The ordinary way of naming this number in English, will be the often repeating of millions, of millions, of millions, of millions, of millions, of millions, of millions (which is the denomination of the second six figures). In which way, it will be very hard to have any distinguishing notions of this number: but whether, by giving every six figures a new and orderly denomination, these, and perhaps a great many more, figures, in progression, might not easily be counted distinctly, and ideas of them both got more easily to ourselves, and more plainly signified to others, I leave it to be considered. This I mention only to shew how necessary distinct names are to numbering, without pretending to introduce new ones of my invention.

§ 7. *Why children number not earlier.*—Thus children, either for want of names to mark the several progressions of numbers, or not having yet the faculty to collect scattered ideas into complex ones, and

* Histoire d'un Voyage, fait en la terre du Brasil, per Jean de Lery, c. 20. $\frac{307}{82}$.

range them in a regular order, and so retain them in their memories, as is necessary to reckoning, do not begin to number very early, nor proceed in it very far or steadily, until a good while after they are well furnished with good store of other ideas; and one may often observe them discourse and reason pretty well, and have very clear conceptions of several other things, before they can tell twenty. And some, through the default of their memories, who cannot retain the several combinations of numbers, with their names annexed in their distinct orders, and the dependance of so long a train of numeral progressions, and their relation to one another, are not able, all their life-time, to reckon, or regularly go over, any moderate series of numbers. For he that will count twenty, or have any idea of that number, must know, that nineteen went before, with the distinct name or sign of every one of them, as they stand marked in their order; for wherever this fails, a gap is made, the chain breaks, and the progress in numbering can go no farther. So that to reckon right, it is required, 1, That the mind distinguishes carefully two ideas, which are different one from another, only by the addition or subtraction of one unit. 2, That it retain in memory the names or marks of the several combinations from an unit to that number; and that not confusedly, and at random, but in that exact order, that the numbers follow one another; in either of which, if it trips, the whole business of numbering will be disturbed, and there will remain only the confused idea of multitude; but the ideas necessary to distinct numeration, will not be attained to.

§ 8. *Number measures all measurables.*—This farther is observable in number, that it is that which the mind makes use of in measuring all things that by us are measurable, which principally are expansion and duration; and our idea of infinity, even when applied to those, seems to be nothing but the infinity of number. For what else are our ideas of eternity and immensity, but the repeated additions of certain ideas of imagined parts of duration and expansion, with the infinity of number in which we can come to no end of addition? For such an inexhaustible stock, number (of all other ideas) most clearly furnishes us with, as is obvious to every one. For let a man collect into one sum, as great a number as he pleases, this multitude, how great soever, lessens not one jot the power of adding to it, or brings him any nearer the end of the inexhaustible stock of number, where still there remains as much to be added, as if none were taken out. And this endless addition, or addibility (if any one like the word better) of numbers, so apparent to the mind, is that, I think, which gives us the clearest and most distinct idea of infinity: of which, more in the following chapter.

CHAP. XVII.

OF INFINITY.

§ 1. *Infinity, in its original intention, attributed to space, duration, and number.*—He that would know what kind of idea it is to which we give the name of infinity, cannot do it better than by considering to

what infinity is by the mind more immediately attributed, and then how the mind comes to frame it.

Finite and infinite, seem to me to be looked upon by the mind as the modes of quantity; and to be attributed primarily, in their first designation, only to those things which have parts, and are capable of increase or diminution, by the addition or subtraction of any the least part; and such are the ideas of space, duration, and number, which we have considered in the foregoing chapters. It is true, that we cannot but be assured, that the great God, of whom, and from whom, are all things, is incomprehensibly infinite. But yet, when we apply to that first and supreme Being, our idea of infinite, in our weak and narrow thoughts, we do it primarily in respect to his duration and ubiquity; and, I think, more figuratively to his power, wisdom, and goodness, and other attributes, which are properly inexhaustible and incomprehensible, &c. For when we call them infinite, we have no other idea of this infinity, but what carries with it some reflection on, and intimation of, that number or extent of the acts or objects of God's power, wisdom, and goodness, which can never be supposed so great, or so many, which these attributes will not always surmount and exceed, let us multiply them in our thoughts as far as we can, with all the infinity of endless number. I do not pretend to say how these attributes are in God, who is infinitely beyond the reach of our narrow capacities: they do, without doubt, contain in them all possible perfection: but this, I say, is our way of conceiving them, and these our ideas of their infinity.

§ 2. *The idea of finite easily found.*—Finite, then, and infinite, being by the mind looked on as modifications of expansion and duration, the next thing to be considered, is, how the mind comes by them. As for the idea of finite, there is no great difficulty. The obvious portions of extension that affect our senses, carry with them into the mind the idea of finite: and the ordinary periods succession, whereby we measure time and duration, as hours, days, and years, are bounded lengths. The difficulty is, how we come by those boundless ideas of eternity and immensity, since the objects we converse with come so much short of any approach or proportion to that largeness.

§ 3. *How we come by the idea of infinity.*—Every one that has any idea of any stated lengths of space, as a foot, finds that he can repeat the idea; and joining it to the former, make the idea of two feet; and by the addition of a third, three feet; and so on, without ever coming to an end of his addition, whether of the same idea of a foot, or if he pleases of doubling it, or any other idea he has of any length, as a mile, or diameter of the earth, or of the *orbis magnus*; for whichsoever of these he takes, and how often soever he doubles, or any otherwise multiplies it, he finds, that after he has continued this doubling in his thoughts, and enlarged his idea as much as he pleases, he has no more reason to stop, nor is one jot nearer the end of such addition, than he was at first setting out; the power of enlarging his idea of space by farther additions, remaining still the same, he hence takes the idea of infinite space.

§ 4 *Our idea of space, boundless.*—This, I think, is the way whereby the mind gets the idea of infinite space. It is a quite different con-

sideration to examine, whether the mind has the idea of such a boundless space actually existing, since our ideas are not always proof of the existence of things; but yet, since this comes here in our way, I suppose I may say, that we are apt to think that space in itself is actually boundless; to which imagination, the idea of space or expansion of itself naturally leads us. For it being considered by us either as the extension of body, or as existing by itself, without any solid matter taking it up (for of such a void space we have not only the idea, but I have proved, as I think, from the motion of body, its necessary existence), it is impossible the mind should be ever able to find or suppose any end of it, or be stopped any where in its progress in this space, how far soever it extends its thoughts. Any bounds made with body, even adamant walls, are so far from putting a stop to the mind in its farther progress in this space and extension, that it rather facilitates than enlarges it! for so far as that body reaches, so far no one can doubt of extension; and when we are come to the utmost extremity of body, what is there that can there put a stop, and satisfy the mind that it is at the end of space, when it perceives it is not; nay, when it is satisfied that body itself can move into it? For if it be necessary for the motion of the body that there should be an empty space, though ever so little, here amongst bodies; and it be possible for body to move in or through that empty space; nay, it is impossible for any particle of matter to move but into an empty space; the same possibility of a body's moving into a void space, beyond the utmost bounds of body, as well as into a void space interspersed amongst bodies, will always remain clear and evident, the idea of empty pure space, whether within, or beyond the confines of all bodies, being exactly the same, differing not in nature, though in bulk; and there being nothing to hinder body from moving into it. So that wherever the mind places itself by any thought, either amongst, or remote from all bodies, it can, in this uniform idea or space, nowhere find any bounds, any end; and so must necessarily conclude it, by the very nature and idea of each part of it, to be actually infinite.

§ 5. *And so of duration.*—As by the power we find in ourselves of repeating, as often as we will, any idea of space, we get the idea of immensity; so, by being able to repeat the idea of any length of duration we have in our minds, with all the endless addition of number, we come by the idea of eternity. For we find in ourselves, we can no more come to the end of such repeated ideas, than we can come to the end of number, which every one perceives he cannot. But here again it is another question, quite different from our having an idea of eternity, to know whether there were any real being, whose duration has been eternal. And as to this, I say, he that considers something now existing, must necessarily come to something eternal. But having spoke of this in another place, I shall here say no more of it, but proceed on to some other considerations of our idea of infinity.

§ 6. *Why other ideas are not capable of infinity.*—If it be so, that our idea of infinity be got from the power we observe in ourselves, of repeating without end our own ideas, it may be demanded, “Why we do not attribute infinity to other ideas, as well as those of space and duration; since they may be as easily, and as often, repeated in our

minds as the other ; and yet nobody ever thinks of infinite sweetness or infinite whiteness, though he can repeat the idea of sweet or white, as frequently as those of a yard or a day?" To which I answer, all the ideas that are considered as having parts, and are capable of increase by the addition of any equal or less parts, afford us, by their repetition, the idea of infinity ; because, with this endless repetition, there is continued an enlargement, of which there can be no end. But in other ideas it is not so ; for to the largest idea of extension or duration, that I at present have, the addition of any of the least part, makes an increase ; but to the perfectest idea I have of the whitest whiteness, if I add another of a less or equal whiteness (and of a whiter than I have, I cannot add the idea), it makes no increase, and enlarges not my idea at all ; and, therefore, the different ideas of whiteness, &c., are called degrees. For those ideas that consist of parts, are capable of being augmented by every addition of the least part ; but if you take the idea of white, which one parcel of snow yielded yesterday to your sight, and another idea of white, from another parcel of snow you see to-day, and put them together in your mind, they embody, as it were, and run into one, and the idea of whiteness is not at all increased ; and if we add a less degree of whiteness to a greater, we are so far from encreasing, that we diminish it. Those ideas that consist not of parts, cannot be augmented to what proportion men please, or be stretched beyond what they have received by their senses ; but space, duration, and number, being capable of increase by repetition, leave in the mind an idea of an endless room for more ; nor can we conceive any where a stop to a farther addition or progression, and so those ideas alone lead our minds towards the thought of infinity.

§ 7. *Difference between infinity of space, and space infinite.*—Though our idea of infinity arise from the contemplation of quantity, and the endless increase the mind is able to make in quantity, by the repeated additions of what portions thereof it pleases ; yet I guess we cause great confusion in our thoughts, when we join infinity to any supposed idea of quantity the mind can be thought to have, and so discourse or reason about an infinite quantity, viz., an infinite space, or an infinite duration. For our idea of infinity being, as I think, an endless growing idea, by the idea of any quantity the mind has, being at that time terminated in that idea (for be it as great as it will, it can be no greater than it is), to join infinity to it, is to adjust a standing measure to a growing bulk ; and, therefore, I think it is not an insignificant subtilty, if I say, that we are carefully to distinguish between the idea of the infinity of space, and the idea of a space infinite. The first is nothing but a supposed endless progression of the mind, over what repeated ideas of space it pleases ; but to have actually in the mind the idea of a space infinite, is to suppose the mind already passed over, and actually to have a view of all those repeated ideas of space which an endless repetition can never totally represent to it ; which carries in it a plain contradiction.

§ 8. *We have no idea of infinite space.*—This perhaps will be a little plainer, if we consider it in numbers. The infinity of numbers, to the end of whose addition every one perceives there is no approach, easily

appears to any one that reflects on it; but how clear soever this idea of the infinity of number be, there is nothing yet more evident, than the absurdity of the actual idea of an infinite number. Whatsoever positive ideas we have in our minds of any space, duration, or number, let them be ever so great, they are still finite; but when we suppose an inexhaustible remainder, from which we remove all bounds, and wherein we allow the mind an endless progression of thought, without ever completing the idea, there we have our idea of infinity; which though it seems to be pretty clear, when we consider nothing else in it but the negation of an end, yet when we would frame in our minds the idea of an infinite space or duration, that idea is very obscure, and confused, because it is made up of two parts, very different, if not inconsistent. For let a man frame in his mind an idea of any space or number, as great as he will; it is plain, the mind rests and terminates in that idea, which is contrary to the idea of infinity, which consists in a supposed endless progression. And, therefore, I think it is, that we are so easily confounded, when we come to argue and reason about infinite space or duration, &c. : because the parts of such an idea, not being perceived to be, as they are inconsistent, the one side or other always perplexes, whatever consequences we draw from the other, as an idea of motion not passing on, would perplex any one who should argue from such an idea, which is not better than an idea of motion at rest; and such another seems to me to be the idea of a space, or (which is the same thing) a number infinite, i. e. of a space or number, which the mind actually has, and so views and terminates in; and of a space or number, which in a constant and endless enlarging and progression, it can in thought never attain to. For how large soever an idea of space I have in my mind, it is no larger than it is that instant that I have it, though I be capable, the next instant, to double it; and so on *in infinitum*; for that alone is infinite, which has no bounds; and that the idea of infinity, in which our thoughts can find none.

§ 9. *Number affords us the clearest idea of infinity.*—But of all other ideas it is number, as I have said, which, I think, furnishes us with the clearest and most distinct idea of infinity we are capable of. For even in space and duration, when the mind pursues the idea of infinity, it there makes use of the ideas and repetitions of numbers, as of millions and millions of miles, or years, which are so many distinct ideas kept best by number from running into a confused heap, wherein the mind loses itself; and when it has added together as many millions, &c. as it pleases, of known lengths of space or duration, the clearest idea it can get of infinity, is the confused incomprehensible remainder of endless addible numbers, which affords no prospect of stop or boundary.

§ 10. *Our different conception of the infinity of number; duration, and expansion.*—It will, perhaps, give us a little farther light into the idea we have of infinity, and discover to us, that it is nothing but the infinity of number applied to determinate parts, of which we have in our minds the distinct ideas, if we consider that number is not generally thought by us infinite, whereas duration and extension are apt to be so; which arises from hence, that in number we are at one end as it were; for there being in number nothing less than an unit, we there stop, and

are at an end; but in addition, or increase of number, we can set no bounds; and so it is like a line, whereof one end terminating with us, the other is extended still forwards, beyond all that we can conceive; but in space and duration it is otherwise. For in duration, we consider it as if this line of number were extended both ways to an un-conceivable, undeterminate, and infinite length; which is evident to any one that will but reflect on what consideration he hath of eternity; which, I suppose, he will find to be nothing else but the turning this infinity of number both ways, *à parte ante*, and *à parte post*, as they speak. For when we would consider eternity *à parte ante*, what do we but, beginning from ourselves, and the present time we are in, repeat in our minds the ideas of years, or ages, or any other assignable portion of duration past, with a prospect of proceeding, in such addition, with all the infinity of number? and when we would consider eternity, *à parte post*, we just after the same rate begin from ourselves, and reckon by multiplied periods yet to come, still extending that line of number as before; and these two being put together, are that infinite duration we call eternity; which, as we turn our view either way, forwards or backwards, appears infinite, because we still turn that way the infinite end of number, i. e. the power still of adding more.

§ 11. The same happens also in space, wherein conceiving ourselves to be as it were in the centre, we do on all sides pursue those indeterminate lines of number; and reckoning any way from ourselves, a yard, mile, diameter of the earth, or *orbis magnus*, by the infinity of number, we add others to them as often we will; and having no more reason to set bounds to those repeated ideas, than we have to set bounds to number, we have that indeterminate idea of immensity.

§ 12. *Infinite divisibility*.—And since, in any bulk of matter, our thoughts can never arrive at the utmost divisibility, therefore there is an apparent infinity to us also in that, which has the infinity also of number; but with this difference, that in the former considerations of the infinity of space and duration, we only use addition of numbers; whereas this is like the division of an unit into its fractions, wherein the mind also can proceed *in infinitum*, as well as in the former additions, it being indeed but the addition still of new numbers: though, in the addition of the one, we can have no more the positive idea of a space infinitely great; than in the division of the other, we can have the idea of a body infinitely little; our idea of infinity being, as I may say, a growing or fugitive idea, still in a boundless progression, that can stop no where.

§ 13. *No positive idea of infinity*.—Though it be hard, I think, to find any one so absurd as to say, he has the positive idea of an actual infinite number; the infinity whereof lies only in a power still of adding any combination of units to any former number, and that as long, and as much, as one will; the like also being in the infinity of space and duration, which power leaves always to the mind room for endless additions; yet there be those who imagine they have positive ideas of infinite duration and space. It would, I think, be enough to destroy any such positive idea of infinite, to ask him that has it, whether he could add to it or no; which would easily shew the mistake of such a positive

idea. We can, I think, have no positive idea of any space or duration, which is not made up of, and commensurate to, repeated numbers of feet or yards, or days and years, which are the common measures whereof we have the ideas in our minds, and whereby we judge of the greatness of this sort of quantities. And, therefore, since an idea of infinite space or duration must needs be made up of infinite parts, it can have no other infinity than that of number, capable still of farther addition; but not an actual positive idea of a number infinite. For, I think, it is evident, that the addition of finite things together (as are all lengths, whereof we have the positive ideas), can never otherwise produce the idea of infinity, than as number does; which consisting of additions of infinite units one to another, suggests the idea of infinite, only by a power we find we have of still increasing the sum, and adding more of the same kind, without coming one jot nearer the end of such progression.

§ 14. They who would prove their idea of infinite to be positive, seem to me to do it by a pleasant argument, taken from the negation of an end, which being negative, the negation of it is positive. He that considers that the end is, in body, but the extremity or superficies of that body, will not, perhaps, be forward to grant, that the end is a bare negative: and he that perceives the end of his pen is black or white, will be apt to think, that the end is something more than a pure negation. Nor is it, when applied to duration, the bare negation of existence, but more properly the last moment of it. But if they will have the end to be nothing but the bare negation of existence, I am sure they cannot deny but the beginning is the first instant of being, and is not by any body conceived to be a bare negation; and, therefore, by their own argument, the idea of eternal, *à parte ante*, or of a duration without a beginning, is but a negative idea.

§ 15. *What is positive, what negative, in our idea of infinite.*—The idea of infinite, has, I confess, something of positive in all those things we apply to it. When we would think of infinite space or duration, we, at first step, usually make some very large idea, as, perhaps, of millions of ages or miles, which possibly we double and multiply several times. All that we thus amass together in our thoughts, is positive, and the assemblage of a great number of positive ideas of space or duration. But what still remains beyond this, we have no more a positive distinct notion of, than a mariner has of the depth of the sea, where having let down a large portion of his sounding-line, he reaches no bottom: whereby he knows the depth to be so many fathoms and more: but how much that more is, he hath no distinct notion at all: and could he always supply new line, and find the plummet always sink, without ever stopping, he would be something in the posture of the mind reaching after a complete and positive idea of infinity. In which case, let this line be ten, or ten thousand, fathoms long, it equally discovers what is beyond it; and gives only this confused and comparative idea, that this is not all, but one may yet go farther. So much as the mind comprehends of any space, it has a positive idea of: but in endeavouring to make it infinite, it being always enlarging, always advancing, the idea is still imperfect and incomplete. So much space as the

mind takes a view of in its contemplation of greatness, is a clear picture, and positive in the understanding: but infinite is still greater. 1, Then the idea of so much, is positive and clear. 2, The idea of greater, is also clear, but it is but a comparative idea, viz., the idea of so much greater as cannot be comprehended; and this is plainly negative, not positive. For he has no positive clear idea of the largeness of any extension (which is that sought for in the idea of infinite), that has not a comprehensive idea of the dimensions of it; and such, nobody, I think, pretends to in what is infinite. For to say a man has a positive clear idea of any quantity, without knowing how great it is, is as reasonable as to say, he has the positive clear idea of the number of the sands on the sea-shore, who knows not how many there be; but only that they are more than twenty. For just such a perfect and positive idea has he of an infinite space or duration, who says, it is larger than the extent or duration of ten, one hundred, one thousand, or any other number of miles or years, whereof he has, or can have, a positive idea; which is all the idea, I think, we have of infinite. So that what lies beyond our positive idea towards infinity, lies in obscurity; and has the indeterminate confusion of a negative idea, wherein I know I neither do nor can comprehend all I would, it being too large for a finite and narrow capacity: and that cannot but be very far from a positive complete idea, wherein the greatest part of what I would comprehend, is left out, under the indeterminate intimation of being still greater. For to say, that having in any quantity measured so much, or gone so far, you are not yet at the end, is only to say, that that quantity is greater. So that the negation of an end, in any quantity, is, in other words, only to say, that it is bigger: and a total negation of an end, is but carrying this bigger still with you, in all the progressions your thoughts shall make in quantity; and adding this idea of still greater, to all the ideas you have, or can be supposed to have, of quantity. Now, whether such an idea as that be positive, I leave any one to consider.

§ 16. *We have no positive idea of an infinite duration.*—I ask those who say they have a positive idea of eternity, whether their idea of duration includes in it succession or not? If it does not, they ought to shew the difference of their notion of duration, when applied to an eternal being, and to a finite: since, perhaps, there may be others, as well as I, who will own to them their weakness of understanding in this point; and acknowledge that the notion they have of duration, forces them to conceive, that whatever has duration, is of a longer continuance to-day than it was yesterday. If to avoid succession in external existence, they recur to the *punctum stans* of the schools, I suppose they will thereby very little mend the matter, or help us to a more clear and positive idea of infinite duration, there being nothing more inconceivable to me, than duration without succession. Besides, that *punctum stans*, if it signify any thing, being *non quantum*, finite or infinite, cannot belong to it. But if our weak apprehensions cannot separate succession from any duration whatsoever, our idea of eternity can be nothing but of infinite succession of moments of duration, wherein any thing does exist; and whether any one has, or can have, a positive idea of an actual infinite number, I leave him to consider, till his infinite number be

so great, that he himself can add no more to it; and as long as he can increase it, I doubt he himself will think the idea he hath of it, a little too scanty for positive infinity.

§ 17. I think it unavoidable for every considering rational creature, that will but examine his own, or any other, existence, to have the notion of an eternal wise Being, who had no beginning: and such an idea of infinite duration, I am sure I have. But this negation of a beginning, being but the negation of a positive thing, scarce gives me a positive idea of infinity; which whenever I endeavour to extend my thoughts to, I confess myself at a loss, and I find I cannot attain any clear comprehension of it.

§ 18. *No positive idea of infinite space.*—He that thinks he has a positive idea of infinite space, will, when he considers it, find that he can no more have a positive idea of the greatest, than he has of the least, space: for in this latter, which seems the easier of the two, and more within our comprehension, we are capable only of a comparative idea of smallness, which will always be less than any one, whereof we have the positive idea. All our positive ideas of any quantity, whether great or little, have always bounds; though our comparative idea, whereby we can always add to the one, and take from the other, hath no bounds. For that which remains either great or little, not being comprehended in that positive idea which we have, lies in obscurity; and we have no other idea of it, but of the power of enlarging the one, and diminishing the other, without ceasing. A pestle and mortar will as soon bring any particle of matter to indivisibility, as the acutest thought of a mathematician; and a surveyor may as soon, with his chain, measure out infinite space, as a philosopher, by the quickest flight of mind, reach it; or by thinking, comprehend it; which is to have a positive idea of it. He that thinks on a cube of an inch diameter, has a clear and positive idea of it in his mind, and so can frame one of a $\frac{1}{2}$ $\frac{1}{4}$ $\frac{1}{8}$, and so on, until he has the ideas in his thoughts of something very little; but yet reaches not the idea of that incomprehensible littleness which division can produce. What remains of smallness, is as far from his thoughts, as when he first began; and, therefore, he never comes at all to have a clear and positive idea of that smallness which is consequent to infinite divisibility.

§ 19. *What is positive, what negative, in our idea of infinite.*—Every one that looks towards infinity, does, as I have said, at first glance, make some very large idea of that which he applies it to, let it be space or duration; and possibly he wears his thoughts, by multiplying in his mind that first large idea; but yet by that he comes no nearer to the having a positive clear idea of what remains to make up a positive infinite, than the country-fellow had of the water, which was yet to come, and pass the channel of the river where he stood:

“Rusticus expectat dum transeat amnis, at ille
Labitur, et labetur in omne volubilis ævum.”

§ 20. *Some think they have a positive idea of eternity, and not of infinite space.*—There are some I have met with, that put so much difference between infinite duration, and infinite space, that they persuade themselves, that they have a positive idea of eternity; but that

they have not, nor can have, any idea of infinite space. The reason of which mistake, I suppose to be this: that finding by a due contemplation of causes and effects, that it is necessary to admit some eternal being, and so to consider the real existence of that being, as taken up, and commensurate to, their idea of eternity; but on the other side, not finding it necessary, but, on the contrary, apparently absurd, that body should be infinite, they forwardly conclude, that they have no idea of infinite space, because they can have no idea of infinite matter. Which consequence, I conceive, is very ill collected; because the existence of matter is no ways necessary to the existence of space, no more than the existence of motion, or the sun, is necessary to duration, though duration uses to be measured by it: and I doubt not but that a man may have the idea of 10,000 miles square, without any body so big, as well as the idea of 10,000 years, without any body so old. It seems as easy to me to have the idea of space empty of body, as to think of the capacity of a bushel without corn, or the hollow of a nutshell without a kernel in it: it being no more necessary that there should be existing a solid body infinitely extended, because we have an idea of the infinity of space, than it is necessary that the world should be eternal, because we have an idea of infinite duration. And why should we think our idea of infinite space requires the real existence of matter to support it, when we find, that we have as clear an idea of an infinite duration to come, as we have of infinite duration past? Though, I suppose, nobody thinks it conceivable, that any thing does, or has existed in that future duration. Nor is it possible to join our idea of future duration with present or past existence, any more than it is possible to make the ideas of yesterday, to-day, and to-morrow, to be the same; or bring ages past and future together, and make them contemporary. But if these men are of the mind that they have clearer ideas of infinite duration, than of infinite space, because it is past doubt, that God has existed from all eternity, but there is no real matter co-extended with infinite space; yet those philosophers who are of opinion, that infinite space is possessed by God's infinite omnipresence, as well as infinite duration, by his eternal existence, must be allowed to have as clear an idea of infinite space, as of infinite duration; though neither of them, I think, has any positive idea of infinity in either case: for whatsoever positive idea a man has in his mind of any quantity, he can repeat it, and add it to the former, as easy as he can add together the ideas of two days or two paces, which are positive ideas of lengths he has in his mind, and so on, as long as he pleases: whereby, if a man had a positive idea of infinite, either duration or space, he could add two infinities together; nay, make one infinite infinitely bigger than another: absurdities too gross to be confuted.

§ 21. *Supposed positive ideas of infinity, cause of mistakes.*—But yet, if after all this, there be men who persuade themselves that they have clear positive comprehensive ideas of infinity, it is fit they enjoy their privilege: and I should be very glad (with some others that I know, who acknowledge they have none such) to be better informed by their communication. For I have been hitherto apt to think, that the great and inextricable difficulties which perpetually involve all discourses

concerning infinity, whether of space, duration, or divisibility, have been the certain marks of a defect in our ideas of infinity, and the disproportion the nature thereof has to the comprehension of our narrow capacities. For whilst men talk and dispute of infinite space or duration, as if they had as complete and positive ideas of them as they have of the names they use for them, or as they have of a yard or an hour, or any other determinate quantity, it is no wonder if the incomprehensible nature of the thing they discourse of, or reason about, leads them into perplexities and contradictions; and their minds be overlaid by an object too large and mighty to be surveyed and managed by them.

§ 22. *All these ideas from sensation and reflection.*—If I have dwelt pretty long on the consideration of duration, space, and number; and what arises from the contemplation of them, infinity; it is possibly no more than the matter requires, there being few simple ideas, whose modes give more exercise to the thoughts of men than these do. I pretend not to treat of them in their full latitude: it suffices to my design, to shew how the mind receives them, such as they are, from sensation and reflection; and how even the idea we have of infinity, how remote soever it may seem to be from any object of sense, or operation of our mind, has nevertheless, as all our other ideas, its original there. Some mathematicians, perhaps, of advanced speculations, may have other ways to introduce into their minds ideas of infinity: but this hinders not, but that they themselves, as well as all other men, got the first ideas which they had of infinity, from sensation and reflection, in the method we have here set down.

CHAP. XVIII.

OF OTHER SIMPLE MODES.

§ 1. *Modes of motion.*—Though I have, in the foregoing chapters, shewn how from simple ideas taken in by sensation, the mind comes to extend itself even to infinity; which, however, it may, of all others, seem most remote from any sensible perception, yet at last hath nothing in it, but what is made out of simple ideas, received into the mind by the senses, and afterward there put together by the faculty the mind has to repeat its own ideas: though, I say, these might be instances enough of simple modes of the simple ideas of sensation, and suffice to shew how the mind comes by them; yet I shall, for method's sake, though briefly, give an account of some few more, and then proceed to more complex ideas.

§ 2. To slide, roll, tumble, walk, creep, run, dance, leap, skip, and abundance of others that might be named, are words which are no sooner heard, but every one who understands English, has presently in his mind distinct ideas, which are all but the different modifications of motion. Modes of motion answer those of extension: swift and slow, are two different ideas of motion, the measures whereof are made of the distances of time and space put together; so they are complex ideas comprehending time and space with motion.

§ 3. *Modes of sounds.*—The like variety have we in sounds. Every

articulate word is a different modification of sound : by which we see, that from the sense of hearing by such modifications, the mind may be furnished with distinct ideas, to almost an infinite number. Sounds also, besides the distinct cries of birds and beasts, are modified by diversity of notes of different length put together, which make that complex idea called a tune, which a musician may have in his mind, when he hears or makes no sounds at all, by reflecting on the ideas of those sounds, so put together, silently in his own fancy.

§ 4. *Modes of colours.*—Those of colours are also very various : some we take notice of as the different degrees, or as they are termed, shades of the same colour. But since we very seldom make assemblages of colours, either for use or delight, but figure is taken in also, and has its part in it, as in painting, weaving, needle-works, &c., those which are taken notice of, do most commonly belong to mixed modes, as being made up of ideas of divers kinds, viz., figure and colour, such as beauty, rainbow, &c.

§ 5. *Modes of taste.*—All compounded tastes and smells, are also modes made up of the simple ideas of those senses. But they being such as generally we have no names for, are less taken notice of, and cannot be set down in writing ; and, therefore, must be left without enumeration, to the thoughts and experience of my reader.

§ 6. *Some simple modes have no names.*—In general it may be observed, that those simple modes which are considered but as different degrees of the same simple idea, though they are in themselves many of them very distinct ideas ; yet have ordinarily no distinct names, nor are much taken notice of, as distinct ideas, where the difference is but very small between them. Whether men have neglected these modes, and given no names to them, as wanting measures nicely to distinguish them ; or because when they were so distinguished, that knowledge would not be of general or necessary use, I leave it to the thoughts of others ; it is sufficient to my purpose to shew, that all our simple ideas come to our minds only by sensation and reflection ; and that when the mind has them, it can variously repeat and compound them, and so make new complex ideas. But though white, red, or sweet, &c., have not been modified, or made into complex ideas, by several combinations, so as to be named, and thereby ranked into species ; yet some others of the simple ideas, viz., those of unity, duration, motion, &c. above instanced in, as also power and thinking, have been thus modified to a great variety of complex ideas, with names belonging to them.

§ 7. *Why some modes have, and others have not, names.*—The reason whereof, I suppose, has been this, that the great concernment of men being with men one amongst another, the knowledge of men and their actions, and the signifying of them to one another, was most necessary ; and, therefore, they made ideas of actions very nicely modified, and gave those complex ideas names, that they might the more easily record and discourse of those things they were daily conversant in, without long ambages and circumlocutions ; and that the things they were continually to give and receive information about, might be the easier and quicker understood. That this is so, and that men in framing different complex ideas, and giving them names, have been much governed

by the end of speech in general (which is a very short and expedite way of conveying their thoughts one to another), is evident in the names, which in several arts have been found out, and applied to several complex ideas of modified actions, belonging to their several trades, for dispatch sake, in their direction or discourses about them. Which ideas are not generally framed in the minds of men not conversant about these operations. And thence the words that stand for them, by the greatest part of men of the same language, are not understood: v. g. colshire, drilling, filtration, cohobation, are words standing for certain complex ideas, which being seldom in the minds of any but those few, whose particular employments do at every turn suggest them to their thoughts, those names of them are not generally understood but by smiths and chymists, who having framed the complex ideas which these words stand for, and having given names to them, or received them from others, upon hearing of these names in communication, readily conceive those ideas in their minds; as by cohobation, all the simple ideas of distilling, and the pouring the liquor distilled from any thing, back upon the remaining matter, and distilling it again. Thus we see, that there are great varieties of simple ideas, as of tastes and smells, which have no names, and of modes many more: which either not having been generally enough observed, or else not being of any great use to be taken notice of, in the affairs and converse of men, they have not had names given to them, and so pass not for species. This we shall have occasion hereafter to consider more at large, when we come to speak of words.

CHAP. XIX.

OF THE MODES OF THINKING.

§ 1. *Sensation, remembrance, contemplation, &c.*—When the mind turns its view inwards upon itself, and contemplates its own actions, thinking is the first that occurs. In it the mind observes a great variety of modifications, and from thence receives distinct ideas. Thus the perception which actually accompanies, and is annexed to, any impression on the body, made by an external object, being distinct from all other modifications of thinking, furnishes the mind with a distinct idea, which we call sensation; which is, as it were, the actual entrance of any idea into the understanding by the senses. The same idea, when it again recurs without the operation of the like object on the external sensory, is remembrance; if it be sought after by the mind, and with pain and endeavour found, and brought again in view, it is recollection: if it be held there long under attentive consideration, it is contemplation: when ideas float in our mind, without any reflection or regard of the understanding, it is that which the French call *reverie*; our language has scarce a name for it. When the ideas that offer themselves (for, as I have observed in another place, whilst we are awake, there will always be a train of ideas succeeding one another in our minds), are taken notice of, and, as it were, registered in the memory, it is attention: when the mind, with great earnestness, and of great choice, fixes its view on any idea, considers it on all sides, and will not be called off by

the ordinary solicitation of other ideas, it is that we call intention, or study; sleep, without dreaming, is rest from all these; and dreaming itself, is the having of ideas (whilst the outward senses are stopped, so that they receive not outward objects with their usual quickness) in the mind, not suggested by any external objects, or known occasion, nor under any choice or conduct of the understanding at all; and whether that, which we call ecstasy, be not dreaming with the eyes open, I leave to be examined.

§ 2. These are some few instances of those various modes of thinking, which the mind may observe in itself, and so have as distinct ideas of, as it hath of white and red, a square or a circle. I do not pretend to enumerate them all, nor to treat at large of this set of ideas, which are got from reflection: that would be to make a volume. It suffices to my present purpose, to have shewn here, by some few examples, of what sort these ideas are, and how the mind comes by them; especially since I shall have occasion hereafter to treat more at large of reasoning, judging, volition, and knowledge, which are some of the most considerable operations of the mind, and modes of thinking.

§ 3. *The various attention of the mind in thinking.*—But, perhaps, it may not be an unpardonable digression, nor wholly impertinent to our present design, if we reflect here upon the different state of the mind in thinking, which those instances of attention, reverie, and dreaming, &c. before-mentioned, naturally enough to suggest. That there are ideas, some or other, always present in the mind of a waking man, every one's experience convinces him; though the mind employs itself about them with several degrees of attention. Sometimes the mind fixes itself with so much earnestness on the contemplation of some objects, that it turns their ideas on all sides, remarks their relations and circumstances, and views every part so nicely, and with such intention, that it shuts out all other thoughts, and takes no notice of the ordinary impressions made then on the senses, which at another season would produce very sensible perceptions: at other times, it barely observes the train of ideas that succeed in the understanding, without directing and pursuing any of them; and at other times, it lets them pass almost quite unregarded, as faint shadows that make no impression.

§ 4. *Hence it is probable that thinking is the action, not essence of the soul.*—This difference of intention and remission of the mind in thinking, with a great variety of degrees, between earnest study, and very near minding nothing at all, every one, I think, has experimented in himself. Trace it a little farther, and you find the mind in sleep, retired as it were from the senses, and out of the reach of those motions made on the organs of sense, which at other times produce very vivid and sensible ideas. I need not, for this, instance in those who sleep out whole stormy nights, without hearing the thunder, or seeing the lightning, or feeling the shaking of the house, which are sensible enough to those who are waking. But in this retirement of the mind from the senses, it often retains a yet more loose and incoherent manner of thinking, which we call dreaming; and last of all, sound sleep closes the scene quite, and puts an end to all appearances. This, I think, almost every one has experience of in himself, and his own observation without diffi-

culty leads him thus far. That which I would farther conclude from hence, is, that since the mind can sensibly put on, at several times, several degrees of thinking; and be sometimes even in a waking man so remiss, as to have thoughts dim and obscure to that degree, that they are very little removed from none at all; and at last, in the dark retirements of sound sleep, loses the sight perfectly of all ideas whatsoever; since, I say, this is evidently so in matter of fact, and constant experience, I ask, whether it be not probable, that thinking is the action, and not the essence, of the soul? Since the operations of agents will easily admit of intention and remission; but the essences of things, are not conceived capable of any such variation. But this by the by.

CHAP. XX.

OF MODES OF PLEASURE AND PAIN.

§ 1. *Pleasure and pain simple ideas.*—Amongst the simple ideas which we receive both from sensation and reflection, pain and pleasure are two very considerable ones. For as in the body, there is sensation barely in itself, or accompanied with pain or pleasure; so the thought, or perception of the mind, is simply so, or else accompanied also with pleasure or pain, delight or trouble, call it how you please. These, like other simple ideas, cannot be described, nor their names defined; the way of knowing them is, as of the simple ideas of the senses, only by experience. For to define them by the presence of good or evil, is no otherwise to make them known to us, than by making us reflect on what we feel in ourselves, upon the several and various operations of good and evil upon our minds, as they are differently applied to, or considered by us.

§ 2. *Good and evil, what.*—Things then are good or evil, only in reference to pleasure or pain. That we call good, which is apt to cause or increase pleasure, or diminish pain in us; or else to procure, or preserve, us the possession of any other good, or absence of any evil. And, on the contrary, we name that evil, which is apt to produce or increase any pain, or diminish any pleasure in us; or else to procure us any evil, or deprive us of any good. By pleasure and pain, I must be understood to mean of body or mind, as they are commonly distinguished; though, in truth, they be only different constitutions of the mind, sometimes occasioned by disorder in the body, sometimes by thoughts of the mind.

§ 3. *Our passions moved by good and evil.*—Pleasure and pain, and that which causes them, good and evil, are the hinges on which our passions turn; and if we reflect on ourselves, and observe how these, under various considerations, operate in us; what modifications or tempers of mind, what internal sensations (if I may so call them), they produce in us, we may thence form to ourselves the ideas of our passions.

§ 4. *Love.*—Thus any one reflecting upon the thought he has of the delight which any present or absent thing is apt to produce in him, has the idea we call love. For when a man declares in autumn, when he is eating them, or in spring, when there are none, that he loves grapes,

it is no more but that the taste of grapes delights him ; let an alteration of health or constitution destroy the delight of their taste, and he then can be said to love grapes no longer.

§ 5. *Hatred*.—On the contrary, the thought of the pain which any thing present or absent is apt to produce in us, is what we call hatred. Were it my business here to inquire any farther than into the bare ideas of our passions, as they depend on different modifications of pleasure and pain, I should remark, that our love and hatred of inanimate insensible beings, is commonly founded on that pleasure and pain which we receive from their use and application any way to our senses, though with their destruction : but hatred or love, to beings capable of happiness or misery, is often the uneasiness or delight which we find in ourselves, arising from a consideration of their very being or happiness. Thus the being and welfare of a man's children or friends producing constant delight in him, he is said constantly to love them. But it suffices to note, that our ideas of love and hatred, are but the dispositions of the mind, in respect of pleasure and pain in general, however caused in us.

§ 6. *Desire*.—The uneasiness a man finds in himself upon the absence of any thing, whose present enjoyment carries the idea of delight with it, is that we call desire, which is greater or less, as that uneasiness is more or less vehement. Where, by the by, it may perhaps be of some use to remark, that the chief, if not only spur to human industry and action, is uneasiness. For whatsoever good is proposed, if its absence carries no displeasure or pain with it ; if a man be easy and content without it, there is no desire of it, nor endeavour after it ; there is no more but a bare velleity, the term used to signify the lowest degree of desire, and that which is next to none at all, when there is so little uneasiness in the absence of any thing, that it carries a man no farther than some faint wishes for it, without any more effectual or vigorous use of the means to attain it. Desire also is stopped or abated by the opinion of the impossibility or unattainableness of the good proposed, as far as the uneasiness is cured or allayed by that consideration. This might carry our thoughts farther, were it seasonable in this place.

§ 7. *Joy*.—Joy is a delight of the mind, from the consideration of the present or assured approaching possession of a good ; and we are then possessed of any good, when we have it so in our power, that we can use it when we please. Thus a man almost starved, has joy at the arrival of relief, even before he has the pleasure of using it : and a father, in whom the very well-being of his children causes delight, is always, as long as his children are in such a state, in the possession of that good ; for he needs but to reflect on it, to have that pleasure.

§ 8. *Sorrow*.—Sorrow is uneasiness in the mind, upon the thought of a good lost, which might have been enjoyed longer ; or the sense of a present evil.

§ 9. *Hope*.—Hope is that pleasure in the mind which every one finds in himself, upon the thought of a profitable future enjoyment of a thing which is apt to delight him.

§ 10. *Fear*.—Fear is an uneasiness of the mind, upon the thought of future evil likely to befall us.

§ 11. *Despair*.—Despair is the thought of the unattainableness of

any good, which works differently in men's minds, sometimes producing uneasiness or pain, sometimes rest and indolency.

§ 12. *Anger*.—Anger is uneasiness or discomposure of the mind, upon the receipt of any injury, with a present purpose of revenge.

§ 13. *Envy*.—Envy is an uneasiness of the mind, caused by the consideration of a good we desire, obtained by one we think should not have had it before us.

§ 14. *What passions all men have*.—These two last, envy and anger, not being caused by pain and pleasure simply in themselves, but having in them some mixed considerations of ourselves and others, are not, therefore, to be found in all men, because those other parts of valuing their merits, or intending revenge, are wanting in them: but all the rest terminating purely in pain and pleasure, are, I think, to be found in all men. For we love, desire, rejoice, and hope, only in respect of pleasure; we hate, fear, and grieve, only in respect of pain ultimately: in fine, all these passions are moved by things, only as they appear to be the causes of pleasure and pain, or to have pleasure and pain some way or other annexed to them. Thus we extend our hatred usually to the subject (at least if a sensible or voluntary agent) which has produced pain in us, because the fear it leaves is a constant pain: but we do not so constantly love what has done us good, because pleasure operates not so strongly on us as pain, and because we are not so ready to have hope it will do so again. But this by the by.

§ 15. *Pleasure and pain, what*.—By pleasure and pain, delight and uneasiness, I must all along be understood (as I have above intimated) to mean, not only bodily pain and pleasure, but whatsoever delight or uneasiness is felt by us, whether arising from any grateful or unacceptable sensation and reflection.

§ 16. It is farther to be considered, that in reference to the passions, the removal or lessening of a pain is considered, and operates as a pleasure: and the loss or diminishing of a pleasure, as a pain.

§ 17. *Shame*.—The passions, too, have most of them in most persons operations on the body, and cause various changes in it; which not being always sensible, do not make a necessary part of the idea of each passion. For shame, which is an uneasiness of the mind, upon the thought of having done something which is indecent, or will lessen the valued esteem which others have for us, has not always blushing accompanying it.

§ 18. *These instances to shew how our ideas of the passions are got from sensation and reflection*.—I would not be mistaken here, as if I meant this as a discourse of the passions; they are many more than those I have here named: and those I have taken notice of, would each of them require a much larger and more accurate discourse. I have only mentioned these here, as so many instances of modes of pleasure and pain resulting in our minds from various considerations of good and evil. I might, perhaps, have instanced in other modes of pleasure and pain more simple than these, as the pain of hunger and thirst, and the pleasure of eating and drinking to remove them; the pain of tender eyes, and the pleasure of music; pain from captious uninformative wrangling, and the pleasure of rational conversation with a friend, or of

well directed study in the search and discovery of truth. But the passions being of much more concernment to us, I rather made choice to instance in them, and shew how the ideas we have of them are derived from sensation and reflection.

CHAP. XXI.

OF POWER.

§ 1. *This idea how got.*—The mind being every day informed by the senses, of the alteration of those simple ideas it observes in things without, and taking notice how one comes to an end and ceases to be, and another begins to exist, which was not before; reflecting also on what passes within itself, and observing a constant change of its ideas, sometimes by the impression of outward objects on the senses, and sometimes by the determination of its own choice; and concluding from what it has so constantly observed to have been, that the like changes will for the future be made in the same things, by like agents, and by the like ways; considers in one thing the possibility of having any of its simple ideas changed, and in another the possibility of making that change; and so comes by that idea which we call power. Thus we say, fire has a power to melt gold, i. e. to destroy the consistency of its insensible parts, and consequently its hardness, and make it fluid; and gold has a power to be melted: that the sun has a power to blanch wax, and wax a power to be blanched by the sun, whereby the yellowness is destroyed, and whiteness made to exist in its room. In which, and the like cases, the power we consider, is in reference to the change of perceivable ideas. For we cannot observe any alteration to be made in, or operation upon, any thing, but by the observable change of its sensible ideas; nor conceive any alteration to be made, but by conceiving a change of some of its ideas.

§ 2. *Power active and passive.*—Power, thus considered, is two-fold, viz., as able to make, or able to receive, any change; the one may be called active, and the other passive, power. Whether matter be not wholly destitute of active power, as its author, God, is truly above all passive power; and whether the intermediate state of created spirits be not that alone which is capable of both active and passive power, may be worth consideration. I shall not now enter into that inquiry, my present business being not to search into the original of power, but how we come by the idea of it. But since active powers make so great a part of our complex ideas of natural substances (as we shall see hereafter), and I mention them as such, according to common apprehension; yet they being not, perhaps, so truly active powers, as our hasty thoughts are apt to represent them, I judge it not amiss, by this intimation, to direct our minds to the consideration of God and spirits, for the clearest idea of active powers.

§ 3. *Power includes relation.*—I confess, power includes in it some kind of relation (a relation to action or change), as, indeed, which of our ideas, of what kind soever, when attentively considered does not? For our ideas of extension, duration, and number, do they not all contain in

them a secret relation of the parts? Figure and motion have something relative in them much more visibly: and sensible qualities, as colours and smells, &c., what are they but the powers of different bodies, in relation to our perception? &c. And if considered in things themselves, do they not depend on the bulk, figure, texture, and motion of the parts? All which include some kind of relation in them. Our idea, therefore, of power, I think, may well have a place amongst other simple ideas, and be considered as one of them, being one of those that make a principal ingredient in our complex ideas of substances, as we shall hereafter have occasion to observe.

§ 4. *The clearest idea of active power had from spirit.*—We are abundantly furnished with the idea of passive power, by almost all sorts of sensible things. In most of them we cannot avoid observing their sensible qualities, nay, their very substances, to be in a continual flux: and, therefore, with reason we look on them as liable still to the same change. Nor have we of active power (which is the more proper signification of the word power) fewer instances. Since whatever change is observed, the mind must collect a power somewhere able to make that change, as well as a possibility in the thing itself to receive it. But yet, if we will consider it attentively, bodies, by our senses, do not afford us so clear and distinct an idea of active power, as we have from reflection on the operations of our minds. For all power relating to action, and there being but two sorts of action whereof we have any idea, viz., thinking and motion, let us consider whence we have the clearest ideas of the powers which produce these actions. 1, Of thinking, body affords us no idea at all; it is only from reflection that we have that. 2, Neither have we from body any idea of the beginning of motion. A body at rest, affords us no idea of any active power to move; and when it is set in motion itself, that motion is rather a passion, than an action in it. For when the ball obeys the stroke of a billiard-stick, it is not any action of the ball, but bare passion: also when by impulse it sets another ball in motion, that lay in its way, it only communicates the motion it had received from another, and loses in itself so much as the other received; which gives us but a very obscure idea of an active power of moving in body, whilst we observe it only to transfer, but not produce, any motion. For it is but a very obscure idea of power, which reaches not the production of the action, but the continuation of the passion. For so is motion in a body impelled by another; the continuation of the alteration made in it from rest to motion being little more an action, than the continuation of the alteration of its figure by the same blow, is an action. The idea of the beginning of motion, we have only from reflection on what passes in ourselves, where we find by experience, that barely by willing it, barely by a thought of the mind, we can move the parts of our bodies which were before at rest. So that it seems to me, we have, from the observation of the operation of bodies by our senses, but a very imperfect, obscure idea of active power, since they afford us not any idea in themselves of the power to begin any action, either motion or thought. But if from the impulse bodies are observed to make one upon another, any one thinks he has a clear idea of power, it serves as well to

my purpose, sensation being one of those ways whereby the mind comes by its ideas: only I thought it worth while to consider here by the way, whether the mind doth not receive its idea of active power clearer from reflection on its own operations, than it doth from any external sensation.

§ 5. *Will and understanding, two powers.*—This at least I think evident, that we find in ourselves a power to begin or forbear, continue or end, several actions of our minds, and motions of our bodies, barely by a thought or preference of the mind ordering, or, as it were, commanding the doing or not doing, such or such a particular action. This power which the mind has thus to order the consideration of any idea, or the forbearing to consider it; or to prefer the motion of any part of the body to its rest, and *vice versâ*, in any particular instance, is that which we call the will. The actual exercise of that power, by directing any particular action, or its forbearance, is that which we call volition or willing. The forbearance of that action, consequent to such order or command of the mind, is called voluntary. And whatsoever action is performed without such a thought of the mind, is called involuntary. The power of perception is that which we call the understanding. Perception, which we make the act of the understanding, is of three sorts: 1, The perception of ideas in our minds. 2, The perception of signification of signs. 3, The perception of the connexion or repugnancy, agreement or disagreement, that there is between any of our ideas. All these are attributed to the understanding, or perceptive power, though it be the two latter only that use allows us to say we understand.

§ 6. *Faculties.*—These powers of the mind, viz., of perceiving, and of preferring, are usually called by another name; and the ordinary way of speaking is, that the understanding and will are two faculties of the mind: a word proper enough, if it be used as all words should be, so as not to breed any confusion in men's thoughts, by being supposed (as I suspect it has been) to stand for some real beings in the soul, that performed those actions of understanding and volition. For when we say, the will is the commanding and superior faculty of the soul, that it is, or is not, free; that it determines the inferior faculties; that it follows the dictates of the understanding, &c.; though these and the like expressions, by those that carefully attend to their own ideas, and conduct their thoughts more by the evidence of things, than the sound of words, may be understood in a clear and distinct sense; yet I suspect, I say, that this way of speaking of faculties has misled many into a confused notion of so many distinct agents in us, which had their several provinces and authorities, and did command, obey, and perform several actions, as so many distinct beings, which has been no small occasion of wrangling, obscurity, and uncertainty in questions relating to them.

§ 7. *Whence the ideas of liberty and necessity.*—Every one, I think, finds in himself a power to begin or forbear, continue or put an end to several actions in himself. From the consideration of the extent of this power of the mind over the action of the man, which every one finds in himself, arise the ideas of liberty and necessity.

§ 8. *Liberty, what.*—All the actions that we have any idea of, reducing themselves, as has been said, to these two, viz., thinking and

motion; so far as a man has power to think, or not to think; to move, or not to move, according to the preference or direction of his own mind; so far is a man free. Wherever any performance or forbearance are not equally in a man's power; wherever doing, or not doing, will not equally follow upon the preference of his mind directing it, there he is not free, though, perhaps, the action may be voluntary. So that the idea of liberty, is the idea of a power in any agent to do or forbear any particular action, according to the determination or thought of the mind, whereby either of them is preferred to the other; where either of them is not in the power of the agent to be produced by him, according to his volition, there he is not at liberty; that agent is under necessity. So that liberty cannot be where there is no thought, no volition, no will; but there may be thought, there may be will, there may be volition, where there is no liberty. A little consideration of an obvious instance or two, may make this clear.

§ 9. *Supposes the understanding and will.*—A tennis-ball, whether in motion by the stroke of a racket, or lying still at rest, is not, by any one, taken to be a free agent. If we inquire into the reason, we shall find it is because we conceive not a tennis-ball to think, and consequently not to have any volition, preference of motion to rest, or *vice versa*; and, therefore, has not liberty, is not a free agent; but all its both motion and rest, come under our idea of necessary, and are so called. Likewise, a man falling into the water (a bridge breaking under him), has not herein liberty, is not a free agent. For though he has volition, though he prefers his not falling to falling; yet the forbearance of that motion not being in his power, the stop or cessation of that motion follows not upon his volition; and therefore, therein he is not free. So a man striking himself, or his friend, by a convulsive motion of his arm, which it is not in his power, by volition, or the direction of his mind to stop, or forbear; nobody thinks he has, in this, liberty; every one pities him, as acting by necessity and constraint.

§ 10. *Belongs not to volition.*—Again, suppose a man to be carried, whilst fast asleep, into a room, where is a person he longs to see and speak with; and be there locked fast in, beyond his power to get out; he awakes, and is glad to find himself in so desirable company, which he stays willingly in, i. e. prefers his stay to going away. I ask, is not this stay voluntary? I think nobody will doubt it; and yet, being locked fast in, it is evident he is not at liberty not to stay, he has not freedom to be gone. So that liberty is not an idea belonging to volition, or preferring, but to the person having the power of doing, or forbearing to do, according as the mind shall choose or direct. Our idea of liberty reaches as far as that power, and no farther. For wherever restraint comes to check that power, or compulsion takes away that indifferency of ability on either side, to act, or to forbear acting, there liberty, and our notion of it, presently ceases.

§ 11. *Voluntary opposed to involuntary, not to necessary.*—We have instances enough, and often more than enough, in our own bodies. A man's heart beats, and the blood circulates, which it is not in his power, by any thought or volition, to stop; and, therefore, in respect to these motions, where rest depends not on his choice, nor would follow the

determination of his mind, if it should prefer it, he is not a free agent. Convulsive motions agitate his legs, so that though he wills it ever so much, he cannot, by any power of his mind, stop their motion (as in that odd disease called *chorea sancti viti*), but he is perpetually dancing; he is not at liberty in this action, but under as much necessity of moving, as a stone that falls, or a tennis-ball struck with a racket. On the other side, a palsy or the stocks hinder his legs from obeying the determination of his mind, if it would, thereby, transfer his body to another place. In all these there is want of freedom, though the sitting still even of a paralytic, whilst he prefers it to a removal, is truly voluntary. Voluntary then is not opposed to necessary; but to involuntary. For man may prefer what he can do, to what he cannot do; the state he is in, to its absence or change; though necessity has made it in itself unalterable.

§ 12. *Liberty, what.*—As it is in the motions of the body, so it is in the thoughts of our minds; where any one is such, that we have power to take it up, or lay it by, according to the preference of the mind, there we are at liberty. A waking man being under the necessity of having some ideas constantly in his mind, is not at liberty to think, or not to think, no more than he is at liberty whether his body shall touch any other or no; but whether he will remove his contemplation from one idea to another, is many times in his choice; and then he is, in respect of his ideas, as much at liberty, as he is in respect of bodies he rests on: he can, at pleasure, remove himself from one to another. But yet some ideas to the mind, like some motions to the body, are such, as in certain circumstances, it cannot avoid, nor obtain their absence by the utmost effort it can use. A man on the rack is not at liberty to lay by the idea of pain, and divert himself with other contemplations; and sometimes a boisterous passion hurries our thoughts, as a hurricane does our bodies, without leaving us the liberty of thinking on other things, which we would rather choose. But as soon as the mind regains the power to stop or continue, begin or forbear, any of these motions of the body without, or thoughts within, according as it thinks fit to prefer either to the other, we then consider the man as a free agent again.

§ 13. *Necessity, what.*—Wherever thought is only wanting, or the power to act or forbear, according to the direction of thought, there necessity takes place. This, in an agent capable of volition, when the beginning or continuation of any action is contrary to that preference of his mind, is called compulsion; when the hindering or stopping any action is contrary to his volition, it is called restraint. Agents that have no thought, no volition at all, are, in every thing, necessary agents.

§ 14. *Liberty belongs not to the will.*—If this be so (as I imagine it is), I leave it to be considered, whether it may not help to put an end to that long agitated, and, I think, unreasonable, because unintelligible question, viz., whether man's will be free or no? For if I mistake not, it follows, from what I have said, that the question itself is altogether improper; and it is as insignificant to ask whether man's will be free, as to ask, whether his sleep be swift, or his virtue square; liberty being as little applicable to the will, as swiftness of motion is to sleep, or

squareness to virtue. Every one would laugh at the absurdity of such a question as either of these; because it is obvious, that the modifications of motion belong not to sleep, nor the difference of figure to virtue; and when any one well considers it, I think he will as plainly perceive, that liberty, which is but a power, belongs only to agents, and cannot be an attribute or modification of the will, which is also but a power.

§ 15. *Volition*.—Such is the difficulty of explaining and giving clear notions of internal actions by sounds, that I must here warn my reader, that ordering, directing, choosing, preferring, &c., which I have made use of, will not distinctly enough express volition, unless he will reflect on what he himself does, when he wills. For example, preferring, which seems perhaps best to express the act of volition, does it not precisely. For though a man would prefer flying to walking, yet who can say he ever wills it? Volition, it is plain, is an act of the mind, knowingly exerting that dominion it takes itself to have over any part of the man, by employing it in, or with-holding it from, any particular action. And what is the will, but the faculty to do this. And is that faculty any thing more in effect than a power, the power of the mind to determine its thoughts, to the producing, continuing, or stopping any action, as far as it depends on us? For can it be denied, that whatever agent has a power to think on its own actions, and to prefer their doing or omission either to other, has that faculty called will? Will then is nothing but such a power. Liberty, on the other side, is the power a man has to do or forbear doing any particular action, according as its doing or forbearance has the actual preference in the mind, which is the same thing as to say, according as he himself wills it.

§ 16. *Powers belonging to agents*.—It is plain then, that the will is nothing but one power or ability, and freedom another power or ability; so that to ask, whether the will has freedom? is to ask, whether one power has another power, one ability another ability? a question at first sight too grossly absurd to make a dispute, or need an answer. For who is it that sees not that powers belong only to agents, and are attributes only of substances, and not of powers themselves? so that this way of putting the question, viz., whether the will be free? is, in effect, to ask, whether the will be a substance, an agent? or at least, to suppose it, since freedom can properly be attributed to nothing else. If freedom can, with any propriety of speech, be applied to power, it may be attributed to the power that is in a man to produce, or forbear producing, motion in parts of his body, by choice or preference; which is that which denominates him free, and is freedom itself. But if any one should ask, whether freedom were free, he would be suspected not to understand well what he said; and he would be thought to deserve Midas's ears, who knowing that rich was a denomination for the possession of riches, should demand whether riches themselves were rich.

§ 17. However, the name faculty, which men have given to this power called the will, and whereby they have been led into a way of talking of the will as acting, may, by an appropriation that disguises its true senses serve a little to palliate the absurdity; yet the will, in truth, signifies nothing but a power or ability to prefer or choose; and when the will,

under the name of a faculty, is considered, as it is, barely as an ability to do something, the absurdity in saying it is free, or not free, will easily discover itself. For if it be reasonable to suppose and talk of faculties, as distinct beings, that can act (as we do, when we say the will orders, and the will is free), it is fit that we should make a speaking faculty, and a walking faculty, and a dancing faculty, by which those actions are produced, which are but several modes of motion; as well as we make the will and understanding to be faculties, by which the actions of choosing and perceiving are produced, which are but several modes of thinking; and we may as properly say, that it is the singing faculty sings, and the dancing faculty dances, as that the will chooses, or that the understanding conceives: or, as is usual, that the will directs the understanding, or the understanding obeys, or obeys not, the will; it being altogether as proper and intelligible to say, that the power of speaking directs the power of singing, or the power of singing obeys, or disobeys, the power of speaking.

§ 18. This way of talking, nevertheless, has prevailed, and, as I guess, produced great confusion. For these being all different powers in the mind, or in the man, to do several actions, he exerts them as he thinks fit; but the power to do one action, is not operated on by the power of doing another action. For the power of thinking, operates not on the power of choosing: nor the power of choosing, on the power of thinking; no more than the power of dancing operates on the power of singing; or the power of singing on the power of dancing, as any one who reflects on it will easily perceive; and yet this is it, which we say, when we thus speak that the will operates on the understanding, or the understanding on the will.

§ 19. I grant, that this or that actual thought may be the occasion of volition, or exercising the power a man has to choose; or the actual choice of the mind, the cause of actual thinking on this or that thing; as the actual singing of such a tune, may be the cause of dancing such a dance; and the actual dancing of such a dance, the occasion of singing such a tune. But in all these, it is not one power that operates on another; but it is the mind that operates and exerts these powers; it is the man that does the action, it is the agent that has power, or is able, to do. For powers are relations, not agents; and that which has the power, or not the power to operate, is that alone which is, or is not, free, and not the power itself; for freedom, or not freedom, can belong to nothing but what has, or has not, a power to act.

§ 20. *Liberty belongs not to the will.*—The attributing to faculties that which belonged not to them, has given occasion to this way of talking; but the introducing into discourses concerning the mind, with the name of faculties, a notion of their operating, has, I suppose, as little advanced our knowledge in that part of ourselves, as the great use and mention of the like invention of faculties, in the operations of the body, has helped us in the knowledge of physic. Not that I deny there are faculties, both in the body and mind; they both of them have their powers of operating, else neither the one nor the other could operate. For nothing can operate that is not able to operate; and that is not able to operate, that has no power to operate. Nor do I deny, that

those words, and the like, are to have their place in the common use of languages that have made them current. It looks like too much affectation wholly to lay them by; and philosophy itself, though it likes not a gaudy dress, yet, when it appears in public, must have so much complacency, as to be clothed in the ordinary fashion and language of the country, so far as it can consist with truth and perspicuity. But the fault has been, that faculties have been spoken of, and represented, as so many distinct agents. For, it being asked, what it was that digested the meat in our stomachs? It was a ready and very satisfactory answer, to say, that it was the digestive faculty. What was it that made any thing come out of the body? The expulsive faculty. What moved? The motive faculty; and so in the mind, the intellectual faculty, or the understanding understood; and the elective faculty, or the will, willed or commanded. This is in short, to say, that the ability to digest, digested; and the ability to move, moved; and the ability to understand, understood. For faculty, ability, and power, I think, are but different names of the same things; which ways of speaking, when put into more intelligible words, will, I think, amount to this much; that digestion is performed by something that is able to digest; motion, by something able to move; and understanding, by something able to understand. And, in truth, it would be very stange, if it should be otherwise; as strange as it would be for a man to be free, without being able to be free.

§ 21. *But to the agent or man.*—To return then to the inquiry about liberty, I think the question is not proper, whether the will be free, but whether a man be free. Thus I think:

First, That so far as any one can, by the direction or choice of his mind, preferring the existence of any action to the non-existence of that action, and *vice versâ*, make it to exist, or not exist, so far he is free. For if I can, by a thought, directing the motion of my finger, make it move when it was at rest, or *vice versâ*, it is evident, that in respect of that, I am free; and if I can, by a light thought of my mind, preferring one to the other, produce either words or silence, I am at liberty to speak, or hold my peace; and as far as this power reaches, of acting, or not acting, by the determination of his own thought preferring either, so far is a man free. For how can we think any one freer, than to have the power to do what he will? And so far as any one can, by preferring any action to its not being, or rest to any action, produce that action or rest, so far can he do what he will. For such a preferring of action to its absence, is the willing of it; and we can scarce tell how to imagine any being freer, than to be able to do what he wills. So that in respect of actions, within the reach of such a power in him, a man seems as free as it is possible for freedom to make him.

§ 22. *In respect of willing, a man is not free.*—But the inquisitive mind of man, willing to shift off from himself, as far as he can, all thoughts of guilt, though it be by putting himself into a worse state than that of fatal necessity, is not content with this: freedom, unless it reaches farther than this, will not serve the turn; and it passes for a good plea, that a man is not free at all, if he be not as free to will, as he is to act what he wills. Concerning a man's liberty, there yet, there-

fore, is raised this farther question, whether a man be free to will? which, I think, is what is meant when it is disputed, whether the will be free. And as to that I imagine,

§ 23. *Secondly*, That willing, or volition, being an action, and freedom consisting in a power of acting or not acting, a man in respect of willing, or the act of volition, when any action in his power is once proposed to his thoughts, as presently to be done, cannot be free. The reason whereof, is very manifest; for it being unavoidable that the action depending on his will, should exist, or not exist; and its existence, or not existence, following perfectly the determination and preference of his will, he cannot avoid willing the existence, or not-existence, of that action; it is absolutely necessary that he will the one, or the other, i. e. prefer the one to the other, since one of them must necessarily follow; and that which does follow, follows by the choice and determination of his mind, that is, by his willing it; for if he did not will it, it would not be. So that in respect of the act of willing, a man, in such a case, is not free; liberty consisting in a power to act, or not to act, which, in regard of volition, a man, upon such a proposal has not. For it is unavoidably necessary to prefer the doing or forbearance of an action in a man's power, which is once so proposed to his thoughts; a man must necessarily will the one or the other of them, upon which preference or volition, the action, or its forbearance, certainly follows, and is truly voluntary; but the act of volition, or preferring one of the two, being that which he cannot avoid, a man, in respect of that act of willing, is under a necessity, and so cannot be free; unless necessity and freedom can consist together, and a man can be free and bound at once.

§ 24. This then is evident, that in all proposals of present action, a man is not at liberty to will, or not to will, because he cannot forbear willing; liberty consisting in a power to act, or to forbear acting, and in that only. For a man that sits still, is said yet to be at liberty, because he can walk if he wills it. But if a man sitting still, has not a power to remove himself, he is not at liberty; so likewise, a man's falling down a precipice, though in motion, is not at liberty, because he cannot stop that motion if he would. This being so, it is plain that a man that is walking, to whom it is proposed to give off walking, is not at liberty, whether he will determine himself to walk, or give off walking, or no: he must necessarily prefer one or the other of them, walking, or not walking; and so it is in regard of all other actions in our power so proposed, which are the far greater number. For considering the vast number of voluntary actions that succeed one another every moment that we are awake, in the course of our lives, there are but few of them that are thought on, or proposed to the will, until the time they are to be done: and in all such actions, as I have shewn, the mind, in respect of willing, has not a power to act, or not to act, wherein consists liberty; the mind, in that case, has not a power to forbear willing; it cannot avoid some determination concerning them, let the consideration be as short, the thought as quick, as it will; it either leaves the man in the state he was before thinking, or changes it: continues the action, or puts an end to it. Whereby it is manifest, that it orders and directs

one in preference to, or with neglect of, the other, and thereby either the continuation or change becomes unavoidably voluntary.

§ 25. *The will determined by something without it.*—Since then it is plain that in most cases a man is not at liberty, whether he will, or no; the next thing demanded is, whether a man be at liberty to will which of the two he pleases, motion or rest? This question carries the absurdity of it so manifestly in itself, that one might thereby sufficiently be convinced, that liberty concerns not the will. For to ask, whether a man be at liberty to will either motion or rest, speaking or silence, which he pleases, is to ask, whether a man can will what he wills, or be pleased with what he is pleased with? A question which I think needs no answer; and they who can make a question of it, must suppose one will to determine the acts of another, and another to determine that; and so on *in infinitum*.

§ 26. To avoid these and the like absurdities, nothing can be of greater use, than to establish in our minds determined ideas of the things under consideration. If the ideas of liberty and volition were well fixed in our understandings, and carried along with us in our minds, as they ought, through all the questions that are raised about them, I suppose a great part of the difficulties that perplex men's thoughts, and entangle their understandings, would be much easier resolved; and we should perceive where the confused signification of terms, or where the nature of the thing, caused the obscurity.

§ 27. *Freedom.*—*First*, then, it is carefully to be remembered, that freedom consists in the dependence of the existence, or not existence, of any action, upon our volition of it; and not in the dependence of any action, or its contrary, on our preference. A man standing on a cliff, is at liberty to leap twenty yards downwards into the sea; not because he has a power to do the contrary action, which is to leap twenty yards upwards, for that he cannot do: but he is therefore free, because he has a power to leap, or not to leap. But if a greater force than his, either holds him fast, or tumbles him down, he is no longer free in that case: because the doing, or forbearance, of that particular action, is no longer in his power. He that is a close prisoner in a room twenty feet square, being at the north side of his chamber, is at liberty to walk twenty feet southward, because he can walk, or not walk it; but is not at the same time at liberty to do the contrary, i. e. to walk twenty feet northward.

In this then consists freedom, viz., in our being able to act, or not to act, according as we shall choose or will.

§ 28. *Volition, what.*—*Secondly*, We must remember, that volition, or willing, is an act of the mind directing its thought to the production of any action, and thereby exerting its power to produce it. To avoid multiplying of words, I would crave leave here, under the word action, to comprehend the forbearance too of any action proposed; sitting still, or holding one's peace, when walking or speaking are proposed, though mere forbearances requiring as much the determination of the will, and being as often weighty in their consequences, as the contrary actions, may, on that consideration, well enough pass for actions too: but this I say, that I may not be mistaken, if, for brevity's sake, I speak thus.

§ 29. *What determines the will.*—*Thirdly*, The will being nothing but a power in the mind to direct the operative faculties of man to motion or rest, as far as they depend on such direction: to the question, what is it determines the will? The true and proper answer is, the mind. For that which determines the general power of directing to this or that particular direction, is nothing but the agent itself exercising the power it has that particular way. If this answer satisfies not, it is plain the meaning of the question, what determines the will? is this, what moves the mind in every particular instance, to determine its general power of directing to this or that particular motion or rest? And to this, I answer, the motive for continuing in the same state or action, is only the present satisfaction in it: the motive to change, is always some uneasiness: nothing setting us upon the change of state, or upon any new action, but some uneasiness. This is the great motive that works on the mind, to put it upon action, which, for shortness sake, we will call determining of the will, which I shall more at large explain.

§ 30. *Will and desire must not be confounded.*—But in the way to it, it will be necessary to premise, that though I have above endeavoured to express the act of volition, by choosing, preferring, and the like terms, that signify desire, as well as volition, for want of other words to mark that act of the mind, whose proper name is willing, or volition; yet it being a very simple act, whosoever desires to understand what it is, will better find it, by reflecting on his own mind, and observing what it does when it wills, than by any variety of articulate sounds whatsoever. This caution of being careful not to be misled by expressions that do not enough keep up the difference between the will and several acts of the mind that are quite distinct from it, I think the more necessary; because I find the will often confounded with several of the affections, especially desire; and one put for the other, and that by men who would not willingly be thought not to have had very distinct notions of things, and not to have writ very clearly about them. This, I imagine, has been no small occasion of obscurity and mistake in this matter, and therefore is, as much as may be, to be avoided. For he that shall turn his thoughts inwards upon what passes in his mind when he wills, shall see that the will or power of volition is conversant about nothing but that particular determination of the mind, whereby, barely by a thought, the mind endeavours to give rise, continuation, or stop, to any action which it takes to be in its power. This, well considered, plainly shews that the will is perfectly distinguished from desire, which, in the very same action, may have a quite contrary tendency from that which our wills set us upon. A man, whom I cannot deny, may oblige me to use persuasions to another, which, at the same time I am speaking, I may wish may not prevail on him. In this case, it is plain, the will and desire run counter. I will the action that tends one way, whilst my desire tends another, and that the direct contrary way. A man, who, by a violent fit of the gout in his limbs, finds a dozingness in his head, or a want of appetite in his stomach, removed, desires to be eased too of the pain of his feet or hands (for wherever there is pain, there is a desire to be rid of it), though yet, whilst he apprehends that the removal of the pain may translate the noxious humour to a more vital part, his will

is never determined to any one action that may serve to remove this pain. Whence it is evident, that desiring and willing are two distinct acts of the mind; and consequently that the will, which is but the power of volition, is much more distinct from desire.

§ 31. *Uneasiness determines the will.*—To return then to inquiry, what is it that determines the will in regard to our actions? And that, upon second thoughts, I am apt to imagine is not, as is generally supposed, the greater good in view; but some (and for the most part, the most pressing) uneasiness a man is at present under. This is that which successively determines the will, and sets us upon those actions we perform. This uneasiness we may call, as it is, desire, which is an uneasiness of the mind, for want of some absent good. All pain of the body, of what sort soever, and disquiet of the mind, is uneasiness; and with this is always joined desire, equal to the pain or uneasiness felt; and is scarce distinguishable from it. For desire being nothing but an uneasiness in the want of an absent good, in reference to any pain felt, ease is that absent good; and until that ease can be attained, we may call it desire, nobody feeling pain, that he wishes not to be eased of, with a desire equal to that pain, and inseparable from it. Besides this desire of ease from pain, there is another, of absent positive good, and here also the desire and uneasiness are equal. As much as we desire any absent good, so much are we in pain for it. But here all absent good does not, according to the greatness it has, or is acknowledged to have, cause pain equal to that greatness; as all pain causes desire equal to itself; because the absence of good is not always a pain, as the presence of pain is. And, therefore, absent good may be looked on, and considered, without desire. But so much as there is any where of desire, so much there is of uneasiness.

§ 32. *Desire is uneasiness.*—That desire is a state of uneasiness, every one who reflects on himself, will quickly find. Who is there that has not felt in desire, what the wise man says of hope (which is not much different from it), that “it being deferred, makes the heart sick;” and that still proportionable to the greatness of the desire, which sometimes raises the uneasiness to that pitch, that it makes people cry out, give me children, give me the thing desired, or I die! Life itself, and all its enjoyments, is a burden that cannot be borne under the lasting and unremoved pressure of such an uneasiness.

§ 33. *The uneasiness of desire determines the will.*—Good and evil, present and absent, it is true, work upon the mind; but that which immediately determines the will, from time to time, to every voluntary action, is the uneasiness of desire, fixed on some absent good, either negative, as indolency to one in pain; or positive, as enjoyment of pleasure. That it is this uneasiness that determines the will to the successive voluntary actions, whereof the greatest part of our lives is made up, and by which we are conducted through different courses to different ends, I shall endeavour to shew both from experience, and the reason of the thing.

§ 34. *This is the spring of action.*—When a man is perfectly content with the state he is in, which is, when he is perfectly without any uneasiness, what industry, what action, what will, is there left, but to con-

tinue in it? Of this every man's observation will satisfy him. And thus we see our all-wise Maker, suitable to our constitution and frame, and knowing what it is that determines the will, has put into man the uneasiness of hunger and thirst, and other natural desires, that return at their seasons, to move and determine their wills, for the preservation of themselves, and the continuation of their species. For I think we may conclude, that if the bare contemplation of these good ends, to which we are carried by these several uneasinesses, had been sufficient to determine the will, and set us on work, we should have had none of these natural pains, and perhaps, in this world, little or no pain at all. "It is better to marry than to burn," says St. Paul; where we may see what it is that chiefly drives men into the enjoyments of a conjugal life. A little burning felt, pushes us more powerfully, than greater pleasures in prospect draw or allure.

§ 35. *The greatest positive good determines not the will, but uneasiness.*—It seems so established and settled a maxim by the general consent of all mankind, that good, the greater good, determines the will, that I do not at all wonder, that when I first published my thoughts on this subject, I took it for granted: and I imagine, that by a great many I shall be thought more excusable, for having then done so, than that now I have ventured to recede from so received an opinion. But yet, upon a stricter inquiry, I am forced to conclude, that good, the greater good, though apprehended and acknowledged to be so, does not determine the will, until our desire, raised proportionably to it, makes us uneasy in the want of it. Convince a man ever so much, that plenty has an advantage over poverty; make him see and own, that the handsome conveniences of life are better than nasty penury; yet as long as he is content with the latter, and finds no uneasiness in it, he moves not; his will never is determined to any action that shall bring him out of it. Let a man be ever so well persuaded of the advantages of virtue, that it is as necessary to a man who has any great aims in this world, or hopes in the next, as food to life; yet until he hungers and thirsts after righteousness, until he feels an uneasiness in the want of it, his will will not be determined to any action in pursuit of this confessed greater good; but any other uneasiness he feels in himself, shall take place, and carry his will to other actions. On the other side, let a drunkard see that his health decays, his estate wastes; discredit and diseases, and the want of all things, even of his beloved drink, attends him in the course he follows; yet the returns of uneasiness to miss his companions, the habitual thirst after his cups at the usual time, drives him to the tavern, though he has in his view the loss of health and plenty, and perhaps of the joys of another life: the least of which is no inconsiderable good, but such, as he confesses, is far greater than the tickling of his palate with a glass of wine, or the idle chat of a soaking club. It is not want of viewing the greater good; for he sees, and acknowledges, it, and in the intervals of his drinking hours, will take resolution to pursue the greater good; but when the uneasiness to miss his accustomed delight returns, the greater acknowledged good loses its hold, and the present uneasiness determines the will to the accustomed action; which thereby gets stronger footing to prevail against the next occasion, though he, at the same time

makes secret promises to himself, that he will do so no more ; this is the last time he will act against the attainment of those greater goods. And thus he is, from time to time, in the state of that unhappy complainer, *Video meliora proboque, deteriora sequor* : which sentence, allowed for true, and made good by constant experience, may this, and possibly no other, way, be easily made intelligible.

§ 36. *Because the removal of uneasiness is the first step to happiness.*—If we inquire into the reason of what experience makes so evident in fact, and examine why it is uneasiness alone operates on the will, and determines it in his choice, we shall find, that we being capable but of one determination of the will to one action at once, the present uneasiness that we are under, does naturally determine the will, in order to that happiness which we all aim at in all our actions ; forasmuch, as whilst we are under any uneasiness, we cannot apprehend ourselves happy, or in the way to it : pain and uneasiness being, by every one, concluded, and felt to be inconsistent with happiness ; spoiling the relish even of those good things which we have : a little pain serving to mar all the pleasure we rejoiced in. And, therefore, that which of course determines the choice of our will to the next action, will always be the removing of pain, as long as we have any left, as the first and necessary step towards happiness.

§ 37. *Because uneasiness alone is present.*—Another reason why it is uneasiness alone determines the will, may be this : because that alone is present, and it is against the nature of things, that what is absent should operate where it is not. It may be said, that absent good may, by contemplation, be brought home to the mind, and made present. The idea of it indeed may be in the mind, and viewed as present there : but nothing will be in the mind as a present good, able to counterbalance the removal of any uneasiness which we are under, till it raises our desire, and the uneasiness of that has the prevalency in determining the will. Till then, the idea in the mind of whatever good, is there only, like other ideas, the object of bare inactive speculation ; but operates not on the will, nor sets us on work : the reason whereof I shall shew by and by. How many are to be found, that have had lively representations set before their minds of the unspeakable joys of heaven, which they acknowledge both possible and probable too, who yet would be content to take up with their happiness here ? and so the prevailing uneasiness of their desires, let loose after the enjoyments of this life, take their turns in the determining their wills, and all that while they take not one step, are not one jot moved, towards the good things of another life, considered as ever so great.

§ 38. *Because all who allow the joys of heaven possible, pursue them not.*—Were the will determined by the views of good, as it appears in contemplation greater or less to the understanding, which is the state of all absent good, and that which in the received opinion the will is supposed to move to, and to be moved by, I do not see how it could ever get loose from the infinite eternal joys of heaven, once proposed and considered as possible. For all absent good, by which alone barely proposed, and coming in view, the will is thought to be determined, and so to set us on action, being only possible, but not infallibly certain, it

is unavoidable, that the infinitely greater possible good, should regularly and constantly determine the will in all the successive actions it directs; and then we should keep constantly and steadily in our course towards heaven, without ever standing still, or directing our actions to any other end: the eternal condition of a future state, infinitely outweighing the expectation of riches or honour, or any other worldly pleasure, which we can propose to ourselves, though we should grant these the more probable to be attained: for nothing future is yet in possession, and so the expectation even of these may deceive us. If it were so, that the greater good in view determines the will, so great a good once proposed, could not but seize the will, and hold it fast to the pursuit of this infinitely greatest good, without ever letting it go again; for the will having a power over, and directing, the thoughts as well as other actions, would, if it were so, hold the contemplation of the mind fixed to that good.

But any great uneasiness is never neglected.—This would be in the state of the mind, and regular tendency of the will in all its determinations, were it determined by that which is considered, and in view, the greater good; but that it is not so, is visible in experience. The infinitely greatest confessed good, being often neglected to satisfy the successive uneasiness of our desires pursuing trifles. But though the greatest allowed, even everlasting unspeakable good, which has sometimes moved, and affected the mind, does not steadfastly hold the will, yet we see any very great and prevailing uneasiness, having once laid hold on the will, lets it not go; by which we may be convinced, what it is that determines the will. Thus any vehement pain of the body; the ungovernable passion of a man violently in love; or the impatient desire of revenge, keeps the will steady and intent, and the will thus determined, never lets the understanding lay by the object, but all the thoughts of the mind, and powers of the body, are uninterruptedly employed that way, by the determination of the will, influenced by that topping uneasiness, as long as it lasts; whereby it seems to me evident, that the will, or power, of setting us upon one action in preference to all others, is determined in us by uneasiness: and whether this be not so, I desire every one to observe in himself.

§ 39. *Desire accompanies all uneasiness.*—I have hitherto chiefly instanced in the uneasiness of desire, as that which determines the will: because that is the chief, and most sensible; and the will seldom orders any action, nor is there any voluntary action performed, without some desire accompanying it; which, I think, is the reason why the will and desire are so often confounded. But yet we are not to look upon the uneasiness which makes up, or at least accompanies, most of the other passions, as wholly excluded in the case. Aversion, fear, anger, envy, shame, &c., have each their uneasiness too, and thereby influence the will. These passions are scarce any of them in life and practice, simple and alone, and wholly unmixed with others; though usually in discourse and contemplation, that carries the name, which operates strongest, and appears most in the present state of the mind. Nay, there is, I think, scarce any of the passions to be found without desire joined with it. I am sure, wherever there is uneasiness, there is desire:

for we constantly desire happiness; and whatever we feel of uneasiness, so much, it is certain, we want of happiness, even in our own opinion, let our state and condition otherwise be what it will. Besides, the present moment not being our eternity, whatever our enjoyment be, we look beyond the present, and desire goes with our foresight, and that still carries the will with it. So that even in joy itself, that which keeps up the action, whereon the enjoyment depends, is the desire to continue it, and fear to lose it; and whenever a greater uneasiness than that takes place in the mind, the will presently is by that determined to some new action, and the present delight neglected.

§ 40. *The most pressing uneasiness naturally determines the will.*—But we being in this world beset with sundry uneasinesses, distracted with different desires, the next inquiry naturally will be, which of them has the precedency in determining the will to the next action? and to that the answer is, that, ordinarily, which is the most pressing of those that are judged capable of being then removed. For the will being the power of directing our operative faculties to some action, for some end, cannot, at any time, be moved towards what is judged, at that time, unattainable; that would be to suppose an intelligent being designedly to act for an end, only to lose its labour; for so it is to act for what is judged not attainable; and, therefore, very great uneasiness move not the will, when they are judged not capable of a cure; they, in that case, put us not upon endeavours. But, these set apart, the most important and urgent uneasiness we at that time feel, is that which ordinarily determines the will, successively, in that train of voluntary actions which make up our lives. The greatest present uneasiness is the spur to action that is constantly felt, and, for the most part, determines the will in its choice of the next action. For this we must carry along with us, that the proper and only object of the will, is some action of ours, and nothing else. For we produce nothing by our willing it, but some action in our power, it is there the will terminated, and reaches no farther.

§ 41. *All desire happiness.*—If it be farther asked, what it is moves desire? I answer, happiness, and that alone. Happiness and misery are the names of two extremes, the utmost bounds whereof we know not; it is what “eye hath not seen, ear not heard, nor hath it entered into the heart of man to conceive.” But of some degrees of both, we have very lively impressions made by several instances of delight and joy on the one side, and torment and sorrow on the other; which, for shortness’ sake, I shall comprehend under the names of pleasure and pain, there being pleasure and pain of the mind as well as the body; “with Him is fulness of joy, and pleasure for evermore.” Or, to speak truly, they are all of the mind; though some have their rise in the mind from thought, others in the body, from certain modifications of motion.

§ 42. *Happiness, what.*—Happiness then in its full extent, is the utmost pleasure we are capable of; and misery the utmost pain: and the lowest degree of what can be called happiness, is so much ease from all pain, and so much present pleasure, as without which, any one cannot be content. Now because pleasure and pain are produced in us by the operation of certain objects, either on our minds or our bodies, and in different degrees; therefore what has an aptness to produce

pleasure in us, is that we call good, and what is apt to produce pain in us, we call evil, for no other reason, but for its aptness to produce pleasure and pain in us, wherein consists our happiness and misery. Farther, though what is apt to produce any degree of pleasure be in itself good; and what is apt to produce any degree of pain, be evil; yet it often happens, that we do not call it so, when it comes in competition with a greater of its sort; because when they come in competition, the degrees also of pleasure and pain have justly a preference. So that if we will rightly estimate what we call good and evil, we shall find it lies much in comparison: for the cause of every less degree of pain, as well as every greater degree of pleasure, has the nature of good, and *vice versa*.

§ 43. *What good is desired, what not.*—Though this be that which is called good and evil; and all good be the proper object of desire in general; yet all good, even seen and confessed to be so, does not necessarily move every particular man's desire; but only that part, or so much of it, as is considered, and taken to make, a necessary part of his happiness. All other good, however great in reality or appearance, excites not a man's desires who looks not on it to make a part of that happiness wherewith he, in his present thoughts, can satisfy himself. Happiness, under this view, every one constantly pursues, and desires what makes any part of it: other things, acknowledged to be good, he can look upon without a desire, pass by, and be content without. There is nobody, I think, so senseless, as to deny that there is pleasure in knowledge: and for the pleasure of sense, they have too many followers to let it be questioned whether men are taken with them or no. Now let one man place his satisfaction in sensual pleasures, another in the delight of knowledge: though each of them cannot but confess, there is great pleasure in what the other pursues; yet neither of them making the other's delight a part of his happiness, their desires are not moved, but each is satisfied without what the other enjoys, and so his will is not determined to the pursuit of it. But yet as soon as the studious man's hunger and thirst makes him uneasy, he whose will was never determined to any pursuit of good cheer, poignant success, delicious wines, by the pleasant taste he has found in them, is, by the uncasiness of hunger and thirst, presently determined to eating and drinking; though possibly with great indifferency what wholesome food comes in his way. And on the other side, the epicure buckles to study, when shame, or the desire to recommend himself to his mistress, shall make him uneasy in the want of any sort of knowledge. Thus, how much soever men are in earnest, and constant in pursuit of happiness; yet they may have a clear view of good, great and confessed good, without being concerned for it, or moved by it, if they think they can make up their happiness without it. Though as to pain, that they are always concerned for; they can feel no uneasiness without being moved. And, therefore, being uneasy in the want of whatever is judged necessary to their happiness, as soon as any good appears to make a part of their portion of happiness, they begin to desire it.

§ 44. *Why the greatest good is not always desired.*—This I think, any one may observe in himself and others, that the greater visible good

does not always raise men's desires in proportion to the greatness it appears, and is acknowledged to have: though every little trouble moves us, and sets us on work to get rid of it. The reason whereof is evident from the nature of our happiness and misery itself. All present pain, whatever it be, makes a part of our present misery: but all absent good does not at any time make a necessary part of our present happiness, nor the absence of it make a part of our misery: if it did, we should be constantly and infinitely miserable; there being infinite degrees of happiness, which are not in our possession. All uneasiness, therefore, being removed, a moderate portion of good serves at present to content men; and some few degrees of pleasure in a succession of ordinary enjoyments, make up a happiness wherein they can be satisfied. If this were not so, there could be no room for those indifferent and visible trifling actions, to which our wills are so often determined; and wherein we voluntarily waste so much of our lives; which remissness could by no means consist with a constant determination of will or desire to the greatest apparent good. That this is so, I think few people need go far from home to be convinced. And indeed, in this life, there are not many, whose happiness reaches so far, as to afford them a constant train of moderate mean pleasures, without any mixture of uneasiness; and yet they could be content to stay here for ever: though they cannot deny, but that it is possible there may be a state of eternal durable joys after this life, far surpassing all the good that is to be found here. Nay, they cannot but see, that it is more possible than the attainment and continuation of that pittance of honour, riches, or pleasure, which they pursue; and for which they neglect that eternal state: but yet in full view of this difference, satisfied of the possibility of a perfect, secure, and lasting happiness in a future state, and under a clear conviction, that it is not to be had here whilst they bound their happiness within some little enjoyment or aim of this life, and exclude the joys of heaven from making any necessary part of it, their desires are not moved by this greater apparent good, nor their wills determined to any action, or endeavour, for its attainment.

§ 45. *Why not being desired, it moves not the will.*—The ordinary necessities of our lives, fill a great part of them with the uneasiness of hunger, thirst, heat, cold, weariness with labour, and sleepiness in their constant returns, &c. To which, if, besides accidental harms, we add the fantastical uneasiness (as itch after honour, power, or riches, &c.) which acquired habits, by fashion, example, and education, have settled in us, and a thousand other irregular desires, which custom has made natural to us, we shall find, that a very little part of our life is so vacant from these uneasinesses, as to leave us free to the attraction of remoter absent good. We are seldom at ease, and free enough from the solicitation of our natural or adopted desires; but a constant succession of uneasinesses out of that stock which natural wants, or acquired habits, have heaped up, take the will in their turns; and no sooner is one action dispatched, which by such a determination of the will we are set upon, but another uneasiness is ready to set us on work. For the removing of the pains we feel, and are at present pressed with, being the getting out of misery, and consequently the first thing to be done in order to hap-

pinness, absent good, though thought on, confessed, and appearing to be good, not making any part of this unhappiness in its absence, is jostled out, to make way for the removal of those uneasinesses we feel; until due and repeated contemplation has brought it nearer to our minds, given some relish of it, and raised in us some desire; which then beginning to make a part of our present uneasiness, stands upon fair terms with the rest, to be satisfied, and so according to its greatness and pressure, comes in its turn to determine the will.

§ 46. *Due consideration raises desire.*—And thus, by a due consideration, and examining any good proposed, it is in our power to raise our desires in a due proportion to the value of that good, whereby, in its turn and place, it may come to work upon the will, and be pursued. For good, though appearing, and allowed ever so great, yet till it has raised desires in our minds, and thereby made us uneasy in its want, it reaches not our wills; we are not within the sphere of its activity; our wills being under the determination only of those uneasinesses which are present to us, which (whilst we have any) are always soliciting, and ready at hand, to give the will its next determination. The balancing, when there is any in the mind, being only which desire shall be next satisfied, which uneasiness first removed. Whereby comes to pass, that as long as any uneasiness, any desire remains on our mind, there is no room for good, barely as such, to come at the will, or at all to determine it. Because, as has been said, the first step in our endeavours after happiness, being to get wholly out of the confines of misery, and to feel no part of it, the will can be at leisure for nothing else, till every uneasiness we feel be perfectly removed: which, in the multitude of wants and desires we are beset with in this imperfect state, we are not like to be ever free from in this world.

§ 47. *The power to suspend the prosecution of any desire, makes way for consideration.*—There being in us a great many uneasinesses always soliciting, and ready to determine, the will, it is natural, as I have said, that the greatest and most pressing should determine the will to the next action; and so it does for the most part, but not always. For the mind having in most cases, as is evident in experience, a power to suspend the execution and satisfaction of any of its desires, and so all, one after another; is at liberty to consider the objects of them, examine them on all sides, and weigh them with others. In this lies the liberty man has; and from the not using of it right, comes all that variety of mistakes, errors, and faults which we run into in the conduct of our lives, and our endeavours after happiness, whilst we precipitate the determination of our wills, and engage too soon before due examination. To prevent this, we have a power to suspend the prosecution of this or that desire, as every one may daily experiment in himself. This seems to me the source of all liberty; in this seems to consist that which is (as I think improperly) called free will. For during this suspension of any desire, before the will be determined to action, and the action (which follows that determination) done, we have opportunity to examine, view, and judge of the good or evil of what we are going to do; and when, upon due examination, we have judged, we have done our duty, all that we can or ought to do, in pursuit of our happiness;

and it is not a fault, but a perfection of our nature, to desire, will, and act, according to the last result of a fair examination.

§ 48. *To be determined by our own judgment, is no restraint to liberty.*—This is so far from being a restraint or diminution of freedom, that it is the very improvement and benefit of it; it is not an abridgment, it is the end and use of our liberty; and the farther we are removed from such a determination, the nearer we are to misery and slavery. A perfect indifferency in the mind, not determinable by its last judgment of the good or evil that is thought to attend its choice, would be so far from being an advantage and excellency of an intellectual nature, that it would be as great an imperfection, as the want of indifferency to act, or not to act, until determined by the will, would be an imperfection on the other side. A man is at liberty to lift up his hand to his head, or let it rest quiet; he is perfectly indifferent in either; and it would be an imperfection in him, if he wanted that power, if he were deprived of that indifferency. But it would be as great an imperfection, if he had the same indifferency, whether he would prefer the lifting up his hand, or its remaining in rest, when it would save his head or eyes from a blow he sees coming: it is as much a perfection, that desire, or the power of preferring, should be determined by good, as that the power of acting should be determined by the will; and the more certain such determination is, the greater is the perfection. Nay, were we determined by any thing but the last result of our own minds, judging of the good or evil of any action, we were not free. The very end of our freedom being, that we may attain the good we choose. And, therefore, every man is put under a necessity by his constitution, as an intelligent being, to be determined in willing by his own thought and judgment, what is best for him to do; else he would be under the determination of some other than himself, which is want of liberty. And to deny, that a man's will, in every determination, follows his own judgment, is to say, that a man wills and acts for an end that he would not have at the time that he wills and acts for it. For if he prefers it in his present thoughts before any other, it is plain, he then thinks better of it, and would have it before any other, unless he can have and not have it, will and not will it, at the same time: a contradiction too manifest to be admitted.

§ 49. *The freest agents are so determined.*—If we look upon those superior beings above us, who enjoy perfect happiness, we shall have reason to judge, that they are more steadily determined in their choice of good, than we; and yet we have no reason to think they are less happy, or less free, than we are. And if it were fit for such poor finite creatures as we are, to pronounce what infinite wisdom and goodness could do, I think we might say, that God himself cannot choose what is not good; the freedom of the Almighty hinders not his being determined by what is best.

§ 50. *A constant determination to a pursuit of happiness, no abridgment of liberty.*—But to give a right view of this mistaken part of liberty; let me ask, “would any one be a changeling, because he is less determined by wise considerations than a wise man? Is it worth the name of freedom, to be at liberty to play the fool, and draw shame and

misery upon a man's self?" If to break loose from the conduct of reason, and to want that restraint of examination and judgment, which keeps us from choosing or doing the worse, be liberty, true liberty, madmen and fools are the only free men; but yet, I think, nobody would choose to be mad for the sake of such liberty, but he that is mad already. The constant desire of happiness, and the constraint it puts upon us to act for it, nobody, I think, accounts an abridgment of liberty, or at least, an abridgment of liberty to be complained of. God Almighty himself is under the necessity of being happy; and the more any intelligent being is so, the nearer is its approach to perfection and happiness. That in this state of ignorance we short-sighted creatures might not mistake true felicity, we are endowed with a power to suspend any particular desire, and keep it from determining the will, and engaging us in action. This is standing still, where we are not sufficiently assured of the way; examination is consulting a guide; the determination of the will, upon inquiry, is following the direction of that guide; and he that has a power to act, or not to act, according as such determination directs, is a free agent; such determination abridges not that power wherein liberty consists. He that has his chains knocked off, and the prison doors set open to him, is perfectly at liberty, because he may either go or stay, as he best likes; though his preference be determined to stay, by the darkness of the night, or illness of the weather, or want of other lodging. He ceases not to be free, though the desire of some convenience to be had there, absolutely determines his preference, and makes him stay in his prison.

§ 51. *The necessity of pursuing true happiness, the foundation of liberty.*—As, therefore, the highest perfection of intellectual nature, lies in a careful and constant pursuit of true and solid happiness; so the care of ourselves, that we mistake not imaginary for real happiness, is the necessary foundation of our liberty. The stronger ties we have to an unalterable pursuit of happiness in general, which is our greatest good, and which, as such, our desires always follow, the more are we free from any necessary determination of our will to any particular action, and from a necessary compliance with our desire, set upon any particular, and then appearing preferable good, until we have duly examined whether it has a tendency to, or be inconsistent with, our real happiness; and, therefore, until we are as much informed upon this inquiry, as the weight of the matter, and the nature of the case, demands, we are, by the necessity of preferring and pursuing true happiness as our greatest good, obliged to suspend the satisfaction of our desires in particular cases.

§ 52. *The reason of it.*—This is the hinge on which turns the liberty of intellectual beings in their constant endeavours after, and a steady prosecution of true felicity, that they can suspend this prosecution, in particular cases, until they have looked before them, and informed themselves whether that particular thing, which is then proposed or desired, lie in the way to their main end, and make a real part of that which is their present good; for the inclination and tendency of their nature to happiness, is an obligation and motive to them to take care not to mistake or miss it; and so, necessarily, puts them upon caution,

deliberation, and wariness, in the direction of their particular actions, which are the means to obtain it. Whatever necessity determines to the pursuit of real bliss, the same necessity, with the same force, establishes suspense, deliberation, and scrutiny of each successive desire, whether the satisfaction of it does not interfere with our true happiness, and mislead us from it. This, as seems to me, is the great privilege of finite intellectual beings; and I desire it may be well considered, whether the great inlet and exercise of all the liberty men have, are capable of, or can be useful, to them, and that whereon depends the turn of their actions, does not lie in this, that they can suspend their desires, and stop them from determining their wills to any action, until they have duly and fairly examined the good and evil of it, as far forth as the weight of the thing requires. This we are able to do, and when we have done it, we have done our duty, and all that is in our power, and indeed all that needs. For since the will supposes knowledge to guide its choice, all that we can do, is to hold our wills undetermined, until we have examined the good and evil of what we desire. What follows after that, follows in a chain of consequences linked one to another, all depending on the last determination of the judgment; which, whether it shall be upon a hasty and precipitate view, or upon a due and mature examination, is in our power; experience shewing us, that, in most cases, we are able to suspend the present satisfaction of any desire.

§ 53. *Government of our passions, the right improvement of liberty.*—But if any extreme disturbance (as sometimes it happens) possesses our whole mind, as when the pain of the rack, an impetuous uneasiness, as of love, anger, or any other violent passion, running away with us, allows us not the liberty of thought, and we are not masters enough of our own minds to consider thoroughly, and examine fairly; God, who knows our frailty, pities our weakness, and requires of us no more than we are able to do, and sees what was, and what was not, in our power, will judge as a kind and merciful father. But the forbearance of a too hasty compliance with our desires, the moderation and restraint of our passions, so that our understandings may be free to examine, and reason unbiassed give its judgment, being that whereon a right direction of our conduct to true happiness depends: it is in this we should employ our chief care and endeavours. In this we should take pains to suit the relish of our minds, to the true intrinsic good or ill that is in things, and not permit an allowed or supposed possible great and weighty good to slip out of our thoughts, without leaving any relish, any desire, of itself there, till, by a due consideration of its true worth, we have formed appetites in our minds suitable to it, and made ourselves uneasy in the want of it, or in the fear of losing it. And how much this is in every one's power, by making resolutions to himself, such as he may keep, is easy for every one to try. Nor let any one say, he cannot govern his passions, nor hinder them from breaking out, and carrying him into action; for what he can do before a prince, or a great man, he can do alone, or in the presence of God, if he will.

§ 54. *How men come to pursue different courses.*—From what has been said, it is easy to give an account, how it comes to pass that though

all men desire happiness, yet their wills carry them so contrarily, and, consequently, some of them to what is evil. And to this I say, that the various and contrary choices that men make in the world, do not argue that they do not all pursue good : but that the same thing is not good to every man alike. This variety of pursuit shews that every one does not place his happiness in the same thing, or choose the same way to it. Were all the concerns of man terminated in this life, why one followed study and knowledge, and another hawking and hunting; why one chose luxury and debauchery, and another sobriety and riches, would not be because every one of these did not aim at his own happiness; but because their happiness was placed in different things. And, therefore, it was a right answer of the physician to his patient that had sore eyes; if you have more pleasure in the taste of wine, than in the use of your sight, wine is good for you; but if the pleasure of seeing be greater to you than that of drinking, wine is naught.

§ 55. The mind has a different relish, as well as the palate; and you will as fruitlessly endeavour to delight all men with riches or glory (which yet some men place their happiness in), as you would to satisfy all men's hunger with cheese or lobsters; which though very agreeable and delicious fare to some, are to others extremely nauseous and offensive; and many people would, with reason, prefer the griping of an hungry belly, to those dishes which are a feast to others. Hence it was, I think, that the philosophers of old did in vain inquire, whether *summum bonum* consisted in riches or bodily delights, or virtue, or contemplation? And they might have as reasonably disputed whether the best relish were to be found in apples, plumbs, or nuts; and have divided themselves into sects upon it. For as pleasant tastes depend not on the things themselves, but their agreeableness to this or that particular palate, wherein there is great variety; so the greatest happiness consists in the having those things which produce the greatest pleasure; and in the absence of those which cause any disturbance, any pain. Now these, to different men, are very different things. If therefore, men in this life only have hope, if in this life they can only enjoy, it is not strange nor unreasonable, that they should seek their happiness by avoiding all things that disease them here, and by pursuing all that delight them; wherein it will be no wonder to find variety and difference. For if there be no prospect beyond the grave, the inference is certainly right, "let us eat and drink," let us enjoy what we delight in, "for to-morrow we shall die." This, I think, may serve to shew us the reason, why, though all men's desires tend to happiness, yet they are not moved by the same object. Men may choose different things, and yet all choose right, supposing them only like a company of poor insects, whereof some are bees, delighted with flowers and their sweetness; others beetles, delighted with other kind of viands; which having enjoyed for a season, they would cease to be, and exist no more for ever.

§ 56. *How men come to choose ill.*—These things duly weighed, will give us, as I think, a clear view into the state of human liberty. Liberty, it is plain, consists in a power to do, or not to do; to do, or forbear doing, as we will. This cannot be denied. But this seeming to comprehend only the actions of a man consecutive to volition, it is

farther inquired, “ whether he be at liberty to will or no ?” And to this it has been answered, that in most cases a man is not at liberty to forbear the act of volition ; he must exert an act of his will, whereby the action proposed is made to exist, or not to exist. But yet there is a case wherein a man is at liberty in respect of willing, and that is the choosing of a remote good as an end to be pursued. Here a man may suspend the act of his choice from being determined for or against the thing proposed, till he has examined whether it be really of a nature in itself and consequences to make him happy or no. For when he has once chosen it, and thereby it is become a part of his happiness, it raises desire, and that proportionably gives him uneasiness, which determines his will, and sets him at work in pursuit of his choice on all occasions that offer. And here we may see how it comes to pass, that a man may justly incur punishment, though it be certain that in all the particular actions that he wills, he does, and necessarily does, will that which he then judges to be good. For though his will be always determined by that which is judged good by his understanding, yet it excuses him not: because, by a too hasty choice of his own making, he has imposed on himself wrong measures of good and evil ; which, however false and fallacious, have the same influence on all his future conduct, as if they were true and right. He has vitiated his own palate, and must be answerable to himself for the sickness and death that follows from it. The eternal law and nature of things must not be altered to comply with his ill-ordered choice. If the neglect or abuse of the liberty he had to examine what would really and truly make for his happiness, misleads him, the miscarriages that follow on it, must be imputed to his own election. He had a power to suspend his determination : it was given him, that he might examine, and take care of his own happiness, and look that he were not deceived. And he could never judge, that it was better to be deceived, than not, in a matter of so great and near concernment.

What has been said, may also discover to us the reason why men in this world prefer different things, and pursue happiness by contrary courses. But yet since men are always constant, and in earnest, in matters of happiness and misery, the question still remains, How men come often to prefer the worse to the better ; and to choose that, which, by their own confession, has made them miserable ?

§ 57. To account for the various and contrary ways men take, though all aim at being happy, we must consider whence the various uneasinesses that determine the will in the preference of each voluntary action, have their rise.

1. *From bodily pain.*—Some of them come from causes not in our power, such as are often the pains of the body from want, disease, or outward injuries, as the rack, &c., which, when present and violent, operate for the most part forcibly on the will, and turn the courses of men’s lives from virtue, piety, and religion, and what before they judged to lead to happiness ; every one not endeavouring, or through disuse, not being able, by the contemplation of remote and future good, to raise in himself desires of them strong enough to counterbalance the uneasiness he feels in those bodily torments, and to keep his will steady in

the choice of those actions which lead to future happiness. A neighbour country has been of late a tragical theatre, from which we might fetch instances, if there needed any, and the world did not in all countries and ages furnish examples enough to confirm that received observation, *Necessitas cogit ad turpia*; and therefore there is great reason for us to pray, "Lead us not into temptation."

2. *From wrong desires, arising from wrong judgment.*—Other uneasinesses arise from our desires of absent good; which desires always bear proportion to, and depend on, the judgment we make, and the relish we have of any absent good: in both which we are apt to be variously misled, and that by our own fault.

§ 58. *Our judgment of present good or evil always right.*—In the first place, I shall consider the wrong judgments men make of future good and evil, whereby their desires are misled. For as to present happiness and misery, when that alone comes into consideration, and the consequences are quite removed, a man never chooses amiss; he knows what best pleases him, and that he actually prefers. Things in their present enjoyment, are what they seem; the apparent and real good are, in this case, always the same. For the pain or pleasure being just so great, and no greater than it is felt, the present good or evil is really so much as it appears. And, therefore, were every action of ours concluded within itself, and drew no consequences after it, we should undoubtedly never err in our choice of good; we should always infallibly prefer the best. Were the pains of honest industry, and of starving with hunger and cold, set together before us, nobody would be in doubt which to choose: were the satisfaction of a lust, and the joys of heaven, offered at once to any one's present possession, he would not balance or err in the determination of his choice.

§ 59. But since our voluntary actions carry not all the happiness and misery that depend on them, along with them in their present performance, but are the precedent causes of good and evil, which they draw after them, and bring upon us when they themselves are passed and cease to be; our desires look beyond our present enjoyments, and carry the mind out to absent good, according to the necessity which we think there is of it, to the making or increase of our happiness. It is our opinion of such a necessity that gives it its attraction: without that, we are not moved by absent good. For in this narrow scantling of capacity which we are accustomed to, and sensible of, here, wherein we enjoy but one pleasure at once, which when all uneasiness is away, is, whilst it lasts, sufficient to make us think ourselves happy; it is not all remote, and even apparent good, that affects us. Because the indolency and enjoyment we have, sufficing for our present happiness, we desire not to venture the change: since we judge that we are happy already, being content, and that is enough. For who is content, is happy. But as soon as any new uneasiness comes in, this happiness is disturbed, and we are set afresh on work in the pursuit of happiness.

§ 60. *From a wrong judgment of what makes a necessary part of their happiness.*—Their aptness therefore to conclude, that they can be happy without it, is one great occasion that men often are not raised to

the desire of the greatest absent good. For whilst such thoughts possess them, the joys of a future state move them not; they have little concern or uneasiness about them; and the will, free from the determination of such desires, is left to the pursuit of nearer satisfactions, and to the removal of those uneasinesses which it then feels in its want of, and longing after, them. Change but a man's view of these things; let him see that virtue and religion are necessary to his happiness; let him look into the future state of bliss or misery, and see there God, the righteous Judge, ready to "render to every man according to his deeds; to them who by patient continuance in well-doing, seek for glory, and honour, and immortality, eternal life; but unto every soul that doth evil, indignation, and wrath, tribulation and anguish:" to him, I say, who hath a prospect of the different state of perfect happiness or misery that attends all men after this life, depending on their behaviour here, the measures of good and evil, that govern his choice, are mightily changed. For since nothing of pleasure and pain in this life, can bear any proportion to the endless happiness, or exquisite misery, of an immortal soul hereafter, actions in his power will have their preference, not according to the transient pleasure or pain that accompanies or follows them here, but as they serve to secure that perfect durable happiness hereafter.

§ 61. *A more particular account of wrong judgments.*—But to account more particularly for the misery that men often bring on themselves, notwithstanding that they do all in earnest pursue happiness, we must consider how things come to be represented to our desires, under deceitful appearances; and that is by the judgment pronouncing wrongly concerning them. To see how far this reaches, and what are the causes of wrong judgment, we must remember that things are judged good or bad in a double sense.

First, That which is properly good or bad, is nothing but barely pleasure or pain.

Secondly, But because not only present pleasure and pain, but that also which is apt, by its efficacy or consequences, to bring it upon us at a distance, is a proper object of our desires, and apt to move a creature that has foresight; therefore things also that draw after them pleasure and pain, are considered as good and evil.

§ 62. The wrong judgment that misleads us, and makes the will often fasten on the worst side, lies in misreporting upon the various comparisons of these. The wrong judgment I am here speaking of, is not what one man may think of the determination of another; but what every man himself must confess to be wrong. For since I lay it for a certain ground, that every intelligent being really seeks happiness, which consists in the enjoyment of pleasure, without any considerable mixture of uneasiness; it is impossible any one should willingly put into his own draught any bitter ingredient, or leave out any thing in his power, that would tend to his satisfaction, and the completing of his happiness, but only by wrong judgment. I shall not here speak of that mistake which is the consequence of invincible error, which scarce deserves the name of wrong judgment; but of that wrong judgment which every man himself must confess to be so.

§ 63. *In comparing present and future.*—If, therefore, as to present pleasure and pain, the mind, as has been said, never mistakes that which is really good or evil; that which is the greater pleasure, or the greater pain, is really just as it appears. But though present pleasure and pain shew their difference and degrees so plainly, as not to leave room for mistake; yet when we compare present pleasure or pain with future (which is usually the case in the most important determinations of the will), we often make wrong judgments of them, taking our measures of them in different positions of distance. Objects, near our view, are apt to be thought greater than those of a larger size, that are more remote; and so it is with pleasures and pains; the present is apt to carry it, and those at a distance have the disadvantage in the comparison. Thus most men, like spend-thrift heirs, are apt to judge a little in hand better than a great deal to come; and so for small matters in possession, part with greater ones in reversion. But that this is a wrong judgment, every one must allow, let his pleasure consist in whatever it will: since that which is future, will certainly come to be present; and then having the same advantage of nearness, will shew itself in its full dimensions, and discover his wilful mistake, who judged of it by unequal measures. Were the pleasure of drinking accompanied, the very moment a man takes off his glass, with that sick stomach and aching head, which, in some men, are sure to follow not many hours after, I think nobody, whatever pleasure he had in his cups, would, on these conditions, ever let wine touch his lips; which yet he daily swallows, and the evil side comes to be chosen only by the fallacy of a little difference in time. But if pleasure or pain can be so lessened only by a few hours' removal, how much more will it be so, by a farther distance, to a man that will not, by a right judgment do what time will, i. e. bring it home upon himself, and consider it as present, and there take its true dimensions? This is the way we usually impose on ourselves, in respect of bare pleasure and pain, or the true degrees of happiness or misery; the future loses its just proportion, and what is present, obtains the preference as the greater. I mention not here the wrong judgment, whereby the absent are not only lessened, but reduced to perfect nothing; when men enjoy what they can in present, and make sure of that, concluding amiss that no evil will thence follow. For that lies not in comparing the greatness of future good and evil, which is that we are here speaking of; but in another sort of wrong judgment, which is concerning good or evil, as it is considered to be the cause and procurement of pleasure or pain that will follow from it.

§ 64. *Causes of this.*—The cause of our judging amiss, when we compare our present pleasure or pain with future, seems to me to be the weak and narrow constitution of our minds; we cannot well enjoy two pleasures at once, much less any pleasure almost, whilst pain possesses us. The present pleasure, if it be not very languid, and almost none at all, fills our narrow souls, and so takes up the whole mind, that it scarce leaves any thought of things absent; or if among our pleasures, there are some which are not strong enough to exclude the consideration of things at a distance; yet we have so great an abhorrence of pain, that a little of it extinguishes all our pleasures: a little bitter mingled

in our cup, leaves no relish of the sweet. Hence it comes, that at any rate we desire to be rid of the present evil, which we are apt to think nothing absent can equal; because under the present pain, we find not ourselves capable of any the least degree of happiness. Men's daily complaints are a loud proof of this; the pain that any one actually feels, is still of all other the worst; and it is with anguish they cry out, "Any rather than this; nothing can be so intolerable as what I now suffer." And, therefore, our whole endeavours and thoughts are intent to get rid of the present evil, before all things, as the first necessary condition to our happiness, let what will follow. Nothing, as we passionately think, can exceed, or almost equal, the uneasiness that sits so heavy upon us. And because the abstinence from a present pleasure, that offers itself, is a pain, nay, oftentimes a very great one, the desire being inflamed by a near and tempting object; it is no wonder that that operates after the same manner pain does, and lessens in our thoughts what is future; and so forces us, as it were, blindfold into its embraces.

§ 65. Add to this, that absent good, or, which is the same thing, future pleasure, especially if of a sort we are unacquainted with, seldom is able to counterbalance any uneasiness, either of pain or desire, which is present. For its greatness being no more than what shall be really tasted when enjoyed, men are apt enough to lessen that, to make it give place to any present desire; and to conclude with themselves, that when it comes to trial, it may possibly not answer the report or opinion that generally passes of it, they having often found, that not only what others have magnified, but even what they themselves have enjoyed with great pleasure and delight at one time, has proved insipid or nauseous at another; and therefore they see nothing in it for which they should forego a present enjoyment. But that this is a false way of judging, when applied to the happiness of another life, they must confess, unless they will say, "God cannot make those happy he designs to be so." For that being intended for a state of happiness, it must certainly be agreeable to every one's wish and desire; could we suppose their reliques as different there, as they are here, yet the manna in heaven will suit every one's palate. Thus much of the wrong judgment we make of present and future pleasure and pain, when they are compared together, and so the absent considered as future.

§ 66. *In considering consequences of actions.*—As to things good or bad in their consequences, and by the aptness that is in them to procure us good or evil in the future, we judge amiss several ways.

1. When we judge that so much evil does not really depend on them, as in truth there does.

2. When we judge, that though the consequences be of that moment, yet it is not of that certainty, but that it may otherwise fall out; or else by some means be avoided, as by industry, address, change, repentance, &c. That these are wrong ways of judging, were easy to shew in every particular, if I would examine them at large singly: but I shall only mention this in general, viz., that it is a very wrong and irrational way of proceeding, to venture a greater good for a less, upon uncertain guesses, and before a due examination be made, proportionable to the weightiness of the matter, and the concernment it is to us not to mistake.

This, I think, every one must confess, especially if he considers the usual causes of his wrong judgment, whereof these following are some.

§ 67. *Causes of this.*—1. *Ignorance*: he that judges without informing himself to the utmost that he is capable, cannot acquit himself of judging amiss.

2. *Inadvertency*: when a man overlooks even that which he does know. This is an affected and present ignorance, which misleads our judgments as much as the other. Judging is, as it were balancing an account, and determining on which side the odds lies. If therefore either side be huddled up in haste, and several of the sums that should have gone into the reckoning, be overlooked, and left out, this precipitancy causes as wrong a judgment, as if it were a perfect ignorance. That which most commonly causes this, is the prevalency of some present pleasure or pain, heightened by our feeble passionate nature, most strongly wrought on by what is present. To check this precipitancy, our understanding and reason was given us, if we will make a right use of it, to search and see, and then judge thereupon. Without liberty, the understanding would be to no purpose: and without understanding, liberty (if it could be) would signify nothing. If a man sees what would do him good or harm, what would make him happy or miserable, without being able to move himself one step towards or from it, what is he the better for seeing? and he that is at liberty to ramble in perfect darkness, what is his liberty better than if he were driven up and down as a bubble by the force of the wind? the being acted by a blind impulse from without or from within, is little odds. The first, therefore, and great use of liberty, is to hinder blind precipitancy; the principal exercise of freedom, is to stand still, open the eyes, look about, and take a view of the consequences of what we are going to do, as much as the weight of the matter requires. How much sloth and negligence, heat and passion, the prevalency of fashion, or acquired indispositions, do severally contribute on occasion, to these wrong judgments, I shall not here farther inquire, I shall only add one other false judgment, which I think necessary to mention, because perhaps it is little taken notice of, though of great influence.

§ 68. *Wrong judgment of what is necessary to our happiness.*—All men desire happiness, that is past doubt: but, as has been already observed, when they are rid of pain, they are apt to take up with any pleasure at hand, or that custom has endeared to them, to rest satisfied in that; and so being happy till some new desire, by making them uneasy, disturbs that happiness, and shews them that they are not so, they look no farther; nor is the will determined to any action in pursuit of any other known or apparent good. For since we find that we cannot enjoy all sorts of good, but one excludes another; we do not fix our ideas on every apparent greater good, unless it be judged to be necessary to our happiness; if we think we can be happy without it, it moves us not. This is another occasion to men of judging wrong, when they take not that to be necessary to their happiness, which really is so. This mistake misleads us both in the choice of the good we aim at, and very often in the means to it, when it is a remote good. But which way ever it be, either by placing it where really it is not, or by neglecting the

means, as not necessary to it, when a man misses his great end, happiness, he will acknowledge he judged not right. That which contributes to this mistake, is the real or supposed unpleasantness of the actions, which are the way to this end, it seeming so preposterous a thing, to men, to make themselves unhappy in order to happiness, that they do not easily bring themselves to it.

§ 69. *We can change the agreeableness, or disagreeableness, in things.*—The last inquiry, therefore, concerning this matter is, “whether it be in a man’s power to change the pleasantness and unpleasantness that accompanies any sort of action?” and as to that, it is plain in many cases he can. Men may, and should, correct their palates, and give a relish to what either has, or they suppose has, none. The relish of the mind, is as various as that of the body, and like that, too, may be altered; and it is a mistake to think, that men cannot change the displeasingness or indifferency that is in actions, into pleasure and desire, if they will do but what is in their power. A due consideration will do it in some cases; and practice, application, and custom in most. Bread or tobacco may be neglected, where they are shewn to be useful to health, because of an indifferency or disrelish to them; reason and consideration at first recommend, and begin their trial, and use finds, or custom makes, them pleasant. That this is so in virtue too, is very certain. Actions are pleasing, or displeasing, either in themselves, or considered as a means to a greater and more desirable end. The eating of a well-seasoned dish suited to a man’s palate, may move the mind by the delight itself that accompanies the eating, without reference to any other end: to which the consideration of the pleasure there is in health and strength (to which that meat is subservient), may add a new gusto, able to make us swallow an ill-relished potion. In the latter of these, any action is rendered more or less pleasing, only by the contemplation of the end, and the being more or less persuaded of its tendency to it, or necessary connexion with it: but the pleasure of the action itself is best acquired, or increased, by use and practice. Trials often reconcile us to that, which at a distance we looked on with aversion; and by repetitions, wear us into a liking of what possibly in the first essay displeased us. Habits have powerful charms, and put so strong attractions of easiness and pleasure into what we accustom ourselves to, that we cannot forbear to do, or at least, be easy in the omission of, actions which habitual practice has suited, and thereby recommends to us. Though this be very visible, and every one’s experience shews him he can do so; yet it is a part in the conduct of men towards their happiness, neglected to a degree, that it will be possibly entertained as a paradox, if it be said, that men can make things or actions more or less pleasing to themselves; and thereby remedy that, to which one may justly impute a great deal of their wandering. Fashion and the common opinion having settled wrong notions, and education and custom ill habits, the just values of things are misplaced, and the palates of men corrupted. Pains should be taken to rectify these; and contrary habits change our pleasures, and give a relish to that which is necessary, or conducive to our happiness. This every one must confess he can do, and when happiness is lost, and misery overtakes him, he will confess, he did amiss in neglecting it, and

condemn himself for it: and I ask every one, whether he has not often done so?

§ 70. *Preference of vice to virtue, a manifest wrong judgment.*—I shall not now enlarge any farther on the wrong judgments, and neglect of what is in their power, whereby men mislead themselves. This would make a volume, and is not my business. But whatever false notions, or shameful neglect of what is in their power, may put men out of their way to happiness, and distract them, as we see, into so different courses of life, this yet is certain, that morality, established upon its true foundations, cannot but determine the choice in any one that will but consider: and he that will not be so far a rational creature, as to reflect seriously upon infinite happiness and misery, must needs condemn himself, as not making that use of his understanding he should. The rewards and punishments of another life, which the Almighty has established as the enforcements of his law, are of weight enough to determine the choice against whatever pleasure or pain this life can shew, when the eternal state is considered but in its bare possibility, which nobody can make any doubt of. He that will allow exquisite and endless happiness to be but the possible consequence of a good life here, and the contrary state, the possible reward of a bad one, must own himself to judge very much amiss, if he does not conclude, that a virtuous life, with the certain expectation of everlasting bliss, which may come, is to be preferred to a vicious one, with the fear of that dreadful state of misery, which it is very possible may overtake the guilty; or at best, the terrible uncertain hope of annihilation. This is evidently so, though the virtuous life here had nothing but pain, and the vicious, continual pleasure: which yet is for the most part quite otherwise, and wicked men have not much the odds to brag of, even in their present possession; nay, all things rightly considered, have, I think, even the worst part here. But when infinite happiness is put in one scale, against infinite misery in the other; if the worst that comes to the pious man, if he mistakes, be the best that the wicked can attain to, if he be in the right, who can, without madness, run the venture? Who in his wits would choose to come within a possibility of infinite misery, which if he miss, there is yet nothing to be got by the hazard? Whereas, on the other side, the sober man ventures nothing against infinite happiness to be got, if his expectation comes to pass. If the good man be in the right, he is eternally happy; if he mistakes, he is not miserable, he feels nothing. On the other side, if the wicked man be in the right, he is not happy; if he mistakes, he is infinitely miserable. Must it not be a most manifest wrong judgment, that does not presently see to which side, in this case, the preference is to be given? I have forborne to mention any thing of the certainty, or probability of a future state, designing here to shew the wrong judgment that any one must allow he makes upon his own principles, laid how he pleases, who prefers the short pleasures of a vicious life upon any consideration, whilst he knows, and cannot but be certain, that a future life is at least possible.

§ 71. *Recapitulation.*—To conclude this inquiry into human liberty, which, as it stood before, I myself, from the beginning, fearing, and a very judicious friend of mine, since the publication, suspecting to have

some mistake in it, though he could not particularly shew it me, I was put upon a stricter review of this chapter. Wherein lighting upon a very easy, and scarce observable, slip I had made, in putting one seemingly indifferent word for another, that discovery opened to me this present view, which here, in this second edition, I submit to the learned world, and which, in short, is this: "liberty is a power to act or not to act, according as the mind directs." A power to direct the operative faculties to motion or rest in particular instances, is that which we call the will. That which in the train of our voluntary actions determines the will to any change of operation is some present uneasiness, which is, or at least is always accompanied with, that of desire. Desire is always moved by evil, to fly it; because a total freedom from pain, always makes a necessary part of our happiness: but every good, nay, every greater good, does not constantly move desire, because it may not make, or may not be taken to make, any necessary part of our happiness. For all that we desire, is only to be happy. But though this general desire of happiness operates constantly and invariably, yet the satisfaction of any particular desire, can be suspended from determining the will to any subservient action, till we have maturely examined, whether the particular apparent good, which we then desire, makes a part of our real happiness, or be consistent or inconsistent with it. The result of our judgment upon that examination, is what ultimately determines the man who could not be free, if his will were determined by any thing but his own desire, guided by his own judgment. I know that liberty, by some, is placed in an indifferency of the man, antecedent to the determination of his will. I wish they who lay so much stress on such an antecedent indifferency, as they call it, had told us plainly, whether this supposed indifferency be antecedent to the thought and judgment of the understanding, as well as to the decree of the will. For it is pretty hard to state it between them; i. e. immediately after the judgment of the understanding, and before the determination of the will, because the determination of the will immediately follows the judgment of the understanding; and to place liberty in an indifferency, antecedent, to the thought and judgment of the understanding, seems to me to place liberty in a state of darkness, wherein we can neither see nor say any thing of it; at least it places it in a subject incapable of it, no agent being allowed capable of liberty, but in consequence of thought and judgment. I am not nice about phrases, and therefore consent to say with those that love to speak so, that liberty is placed in indifferency; but it is an indifferency which remains after the judgment of the understanding; yea, even after the determination of the will. And that is an indifferency not of the man (for after he has once judged which is best, viz., to do or forbear, he is no longer indifferent), but an indifferency of the operative powers of the man, which remaining equally able to operate, or to forbear operating, after, as before, the decree of the will, are in a state, which, if one pleases, may be called indifferency; and as far as this indifferency reaches, a man is free, and no farther; v. g. I have the ability to move my hand, or to let it rest; that operative power is indifferent to move, or not to move, my hand: I am then in that respect perfectly free. My will determines that operative power to rest; I am

yet free; because the indifferency of that my operative power to act, or not to act, still remains; the power of moving my hand, is not at all impaired by the determination of my will, which at present orders rest; the indifferency of that power to act, or not to act, is just as it was before, as will appear, if the will puts it to the trial, by ordering the contrary. But if, during the rest of my hand, it be seized by a sudden palsy, the indifferency of that operative power is gone, and with it, my liberty; I have no longer freedom in that respect, but am under a necessity of letting my hand rest. On the other side, if my hand be put into motion by a convulsion, the indifferency of that operative faculty is taken away by that motion, and my liberty in that case is lost; for I am under a necessity of having my hand move. I have added this, to shew in what sort of indifferency liberty seems to me to consist, and not in any other, real or imaginary.

§ 72. True notions concerning the nature and extent of liberty, are of so great importance, that I hope I shall be pardoned this digression, which my attempt to explain it has led me into. The ideas of will, volition, liberty, and necessity, in this chapter of power, came naturally in my way. In a former edition of this treatise, I gave an account of my thoughts concerning them, according to the light I then had: and now, as a lover of truth, and not a worshipper of my own doctrines, I own some change in my opinion, which I think I have discovered ground for. In what I first writ, I, with an unbiassed indifferency, followed truth whither I thought she led me. But neither being so vain as to fancy infallibility, nor so disingenuous as to dissemble my mistakes, for fear of blemishing my reputation, I have, with the same sincere design for truth only, not been ashamed to publish what a severer inquiry has suggested. It is not impossible, but that some may think my former notions right, and some (as I have already found) these latter; and some neither. I shall not at all wonder at this variety in men's opinions: impartial deductions of reason in controverted points being so rare, and exact ones in abstract notions not so very easy, especially if of any length. And, therefore, I should think myself not a little beholding to any one, who would upon these, or any other grounds, fairly clear this subject of liberty from any difficulties that may yet remain.

Before I close this chapter, it may perhaps be to our purpose, and help to give us clearer conceptions about power, if we make our thoughts take a little more exact survey of action. I have said above, that we have ideas but of two sorts of action, viz. motion and thinking. These, in truth, though called and counted actions, yet, if nearly considered, will not be found to be always perfectly so. For, if I mistake not, there are instances of both kinds, which, upon due consideration, will be found rather passions than actions, and, consequently, so far the effects barely of passive powers in those subjects, which yet, on their accounts, are thought agents. For, in these instances, the substance that hath motion or thought, receives the impression, whereby it is put into that action purely from without, and so acts merely by the capacity it has to receive such an impression from some external agent; and such a power is not properly an active power, but a mere passive capacity in the subject. Sometimes the substance, or agent, puts itself

into action by its own power, and this is properly active power. Whatsoever modification a substance has, whereby it produces any effect, that is called action; v. g. a solid substance by motion operates on, or alters, the sensible ideas of another substance, and, therefore, this modification of motion we call action. But yet, this motion in that solid substance is, when rightly considered, but a passion, if it received it only from some external agent. So that the active power of motion is in no substance which cannot begin motion in itself, or in another substance, when at rest. So likewise in thinking, a power to receive ideas or thoughts, from the operation of any external substance, is called a power of thinking: but this is but a passive power or capacity. But to be able to bring into view, ideas out of sight, at one's own choice, and to compare which of them one thinks fit, this is an active power. This reflection may be of some use to preserve us from mistakes about powers and actions, which grammar, and the common frame of languages, may be apt to lead us into: since what is signified by verbs that grammarians call active, does not always signify action; v. g. this proposition, I see the moon, or a star, or I feel the heat of the sun, though expressed by a verb active, does not signify any action in me, whereby I operate on those substances; but the reception of the ideas of light, roundness, and heat, wherein I am not active, but barely passive, and cannot, in that position of my eyes, or body, avoid receiving them. But when I turn my eyes another way, or remove my body out of the sun-beams, I am properly active; because of my own choice, by a power within myself, I put myself into that motion. Such an action is the product of active power.

§ 73. And thus I have, in a short draught, given a view of our original ideas, from whence all the rest are derived, and of which they are made up; which, if I would consider as a philosopher, and examine on what causes they depend, and of what they are made, I believe they all might be reduced to these very few primary and original ones, viz., extension, solidity, mobility, or the power of being moved; which by our senses, we receive from body; perceptivity, or the power of perception or thinking; motivity, or the power of moving: which, by reflection, we receive from our minds. I crave leave to make use of these two new words, to avoid the danger of being mistaken in the use of those which are equivocal. To which, if we add existence, duration, number, which belong both to the one and the other, we have, perhaps, all the original ideas on which the rest depend. For, by these, I imagine, might be explained the nature of colours, sounds, tastes, smells, and all other ideas we have, if we had but faculties acute enough to perceive the severally modified extensions and motions of these minute bodies, which produce those several sensations in us. But my present purpose being only to inquire into the knowledge the mind has of things, by those ideas and appearances which God has fitted it to receive from them, and how the mind comes by that knowledge, rather than into their causes, or manner of production; I shall not, contrary to the design of this essay, set myself to inquire, philosophically, into the peculiar constitution of bodies, and the configuration of parts, whereby they have the power to produce in us the ideas of their sensible qualities. I

shall not enter any farther into that disquisition, it sufficing to my purpose to observe, that gold or saffron has a power to produce in us the idea of yellow; and snow or milk, the idea of white; which we can only have by our sight, without examining the texture of the parts of those bodies, on the particular figures or motion of the particles which rebound from thence, to cause in us that particular sensation; though when we go beyond the bare ideas in our minds, and would inquire into their causes, we cannot conceive any thing else to be in any sensible object, whereby it produces different ideas in us, but the different bulk, figure, number, texture, and motion of its insensible parts.

CHAP. XXII.

OF MIXED MODES.

§ 1. *Mixed modes, what.*—Having treated of simple modes in the foregoing chapters, and given several instances of some of the most considerable of them, to shew what they are, and how we come by them: we are now, in the next place, to consider those we call mixed modes: such are the complex ideas we mark by the names, obligation, drunkenness, a lie, &c., which, consisting of several combinations of simple ideas of different kinds, I have called mixed modes, to distinguish them from the more simple modes, which consist only of simple ideas of the same kind. These mixed modes being also such combinations of simple ideas, as are not looked upon to be characteristic marks of any real beings, that have a steady existence, but scattered and independent ideas, put together by the mind, are thereby distinguishable from the complex ideas of substances.

§ 2. *Made by the mind.*—That the mind, in respect of its simple ideas, is wholly passive, and receives them all from the existence and operations of things, such as sensation or reflection offers them, without being able to make any one idea, experience shews us. But if we attentively consider these ideas I call mixed modes, we are now speaking of, we shall find their original quite different. The mind often exercises an active power in making these several combinations; for it being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so together in nature. And hence I think it is, that these ideas are called notions; as if they had their original and constant existence more in the thoughts of men, than in the reality of things; and to form such ideas, it sufficed, that the mind puts the parts of them together, and that they were consistent in the understanding, without considering whether they had any real being; though I do not deny, but several of them might be taken from observation, and the existence of several simple ideas, so combined, as they are put together in the understanding. For the man who first framed the idea of hypocrisy, might have either taken it at first from the observation of one who made show of good qualities which he had not; or else have framed that idea in his mind, without having any such pattern to fashion it by. For it is evident that in the beginning of languages and societies of men,

several of those complex ideas which were consequent to the constitutions established amongst them, must needs have been in the minds of men, before they existed any where else ; and that many names that stood for such complex ideas, were in use, and to those ideas framed, before the combinations they stood for ever existed.

§ 3. *Sometimes got by the explication of their names.*—Indeed, now that languages are made, and abound with words standing for such combinations, an usual way of getting these complex ideas, is by the explication of those terms that stand for them. For consisting of a company of simple ideas, combined, they may, by words standing for those simple ideas, be represented to the mind of one who understands those words, though that complex combination of simple ideas were never offered to his mind by the real existence of things. Thus a man may come to have the idea of sacrilege or murder, by enumerating to him the simple ideas which these words stand for, without ever seeing either of them committed.

§ 4. *The name ties the parts of mixed modes into one idea.*—Every mixed mode consisting of many distinct simple ideas, it seems reasonable to inquire “whence it has its unity ; and how such a precise multitude comes to make but one idea, since that combination does not always exist together in nature ?” To which I answer, it is plain it has its unity from an act of the mind combining those several simple ideas together, and considering them as one complex one, consisting of those parts ; and the mark of this union, or that which is looked on generally to complete it, is one name given to that combination. For it is by their names, that men commonly regulate their account of their distinct species of mixed modes, seldom allowing or considering any number of simple ideas to make one complex one, but such collections as there be names for. Thus, though the killing of an old man be as fit, in nature, to be united into one complex idea, as the killing a man’s father ; yet, there being no name standing precisely for the one, as there is the name of parricide to mark the other, it is not taken for a particular complex idea, nor a distinct species of actions, from that of killing a young man, or any other man.

§ 5. *The cause of making mixed modes.*—If we should inquire a little farther, to see what it is that occasions men to make several combinations of simple ideas into distinct, and, as it were, settled modes, and neglect others, which, in the nature of things themselves, have as much an aptness to be combined, and make distinct ideas, we shall find the reason of it to be the end of language ; which being to mark or communicate men’s thoughts to one another with all the dispatch that may be, they usually make such collections of ideas into complex modes, and affix names to them, as they have frequent use of in their way of living and conversation ; leaving others, which they have but seldom an occasion to mention ; loose and without names to tie them together ; they rather choosing to enumerate (when they have need) such ideas as make them up, by the particular names that stand for them, than to trouble their memories by multiplying of complex ideas with names to them, which they seldom or never have any occasion to make use of.

§ 6. *Why words in one language have none answering in another.*—

This shews us how it comes to pass, that there are in every language many particular words, which cannot be rendered by any single word of another; for the several fashions, customs, and manners of one nation, making several combinations of ideas familiar and necessary in one, which another people have had never any occasion to make, or, perhaps, so much as take notice of, names come of course to be annexed to them, to avoid long periphrases in things of daily conversation; and so they become so many distinct complex ideas in their minds. Thus *ὄστρακισμὸς* amongst the Greeks, and *proscriptio* amongst the Romans, were words which other languages had no names that exactly answered, because they stood for complex ideas, which were not in the minds of the men of other nations. Where there was no such custom, there was no notion of any such actions; no use of such combinations of ideas as were united, and, as it were, tied together, by those terms; and, therefore, in other countries, there were no names for them.

§ 7. *And languages change.*—Hence, also, we may see the reason why languages constantly change, take up new, and lay by old, terms; because change of customs and opinions bringing with it new combinations of ideas, which it is necessary frequently to think on and talk about, new names, to avoid long descriptions, are annexed to them; and so they become new species of complex modes. What a number of different ideas are, by this means, wrapped up in one short sound, and how much of our time and breath is, thereby, saved, any one will see, who will but take the pains to enumerate all the ideas that either rephrase or appeal stand for: and, instead of either of those names, use a periphrasis, to make any one understand their meaning.

§ 8. *Mixed modes, where they exist.*—Though I shall have occasion to consider this more at large, when I come to treat of words, and their use; yet I could not avoid to take thus much notice here of the names of mixed modes, which being fleeting and transient combinations of simple ideas, which have but a short existence any where, but in the minds of men, and there, too, have no longer any existence, than whilst they are thought on, have not so much, any where, the appearance of a constant and lasting existence, as in their names; which are, therefore, in this sort of ideas, very apt to be taken for the ideas themselves. For if we should inquire, whether the idea of a triumph or apotheosis exists, it is evident they could neither of them exist altogether any where in the things themselves, being actions that required time to their performance, and so could never all exist together: and as to the minds of men, where the ideas of those actions are supposed to be lodged, they have there, too, a very uncertain existence; and, therefore, we are apt to annex them to the names that excite them in us.

§ 9. *How we get the ideas of mixed modes.*—There are, therefore, three ways whereby we get the complex ideas of mixed modes. 1. By experience and observation of things themselves. Thus by seeing two men wrestle, or fence, we get the idea of wrestling or fencing. 2. By invention, or voluntary putting together of several simple ideas in our minds; so he that first invented printing, or etching, had an idea of it in his mind, before it ever existed. 3. Which is the most usual way, by explaining the names of actions we never saw, or notions we

cannot see; and by enumerating, and thereby, as it were, setting before our imaginations all those ideas which go to the making them up, and are the constituent parts of them. For having by sensation and reflection stored our minds with simple ideas, and by use got the names that stand for them, we can, by those means, represent to another any complex idea we would have him conceive; so that it has in it no simple ideas but what he knows, and has, with us, the same name for. For all our complex ideas are ultimately resolvable into simple ideas, of which they are compounded, and originally made up, though perhaps their immediate ingredients, as I may so say, are also complex ideas. Thus the mixed mode, which the word lye stands for, is made up of these simple ideas; 1. Articulate sounds. 2. Certain ideas in the mind of the speaker. 3. Those words the signs of those ideas. 4. Those signs put together by affirmation or negation, otherwise than the ideas they stand for, are in the mind of the speaker. I think I need not go any farther in the analysis of that complex idea we call a lye; what I have said is enough to shew, that it is made up of simple ideas; and it could not be but an offensive tediousness to my reader, to trouble him with a more minute enumeration of every particular simple idea that goes to this complex one; which, from what has been said, he cannot but be able to make out to himself. The same may be done in all our complex ideas whatsoever; which, however compounded, and decomposed, may at last be resolved into simple ideas, which are all the materials of knowledge or thought we have, or can have. Nor shall we have reason to fear, that the mind is hereby stinted to too scanty a number of ideas, if we consider what an inexhaustible stock of simple modes, number and figure alone affords us. How far then mixed modes, which admit of the various combinations of simple different ideas, and their infinite modes, are from being few and scanty, we may easily imagine. So that before we have done, we shall see, that nobody need be afraid he shall not have scope and compass enough for his thoughts to range in, though they be, as I pretend, confined only to simple ideas received from sensation or reflection, and their several combinations.

§ 10. *Motion, thinking, and power have been most modified.*—It is worth our observing, which of all our simple ideas have been most modified, and had most mixed ideas made out of them, with names given to them; and those have been these three: thinking, and motion (which are the two ideas which comprehend in them all action), and power, and from whence these actions are conceived to flow. The simple ideas, I say, of thinking, motion, and power, have been those which have been most modified; and out of whose modifications have been made most complex modes, with names to them. For action being the great business of mankind, and the whole matter about which all laws are conversant, it is no wonder that the several modes of thinking and motion should be taken notice of, the ideas of them observed, and laid up in the memory, and have names assigned to them; without which, laws could be but ill made, or vice and disorder repressed. Nor could any communication be well had amongst men, without such complex ideas with names to them; and therefore men have settled names, and sup-

posed settled ideas in their minds, of modes of action distinguished by their causes, means, objects, ends, instruments, time, place, and other circumstances; and also of their powers fitted for those actions: v. g. boldness is the power to speak or do what we intend, before others, without fear or disorder; and the Greeks call the confidence of speaking by a peculiar name, *παρρησία*. Which power or ability in man, of doing any thing, when it has been acquired by frequent doing the same thing, is that idea we name habit; when it is forward and ready upon every occasion to break into action, we call it disposition. Thus testiness is a disposition, or aptness to be angry.

To conclude: let us examine any modes of action, v. g. consideration and assent, which are actions of the mind; running and speaking, which are actions of the body; revenge and murder, which are actions of both together, and we shall find them but so many collections of simple ideas, which together make up the complex ones signified by those names.

§ 11. *Several words seeming to signify action, signify but the effect.*—Power being the source from whence all action proceeds, the substances wherein these powers are, when they exert this power into act, are called causes; and the substances which thereupon are produced, or the simple ideas which are introduced into that subject by the exerting of that power, are called effects. The efficacy whereby the new substance or idea is produced, is called, in the subject exerting that power, action; but in the subject wherein any simple idea is changed or produced, it is called passion: which efficacy, however various, and the effects almost infinite, yet we can, I think, conceive it in intellectual agents, to be nothing else but modes of thinking and willing; in corporeal agents, nothing else but modifications of motion. I say, I think we cannot conceive it to be any other but these two: for whatever sort of action, besides these, produces any effects, I confess myself to have no notion or idea of; and so it is quite remote from my thoughts, apprehensions, and knowledge, and as much in the dark to me as five other senses, or as the ideas of colours to a blind man; and therefore many words, which seem to express some action, signify nothing of the action or *modus operandi* at all, but barely the effect with some circumstances of the subject wrought on, or cause operating; v. g. creation, annihilation, contain in them no idea of the action or manner whereby they are produced, but barely of the cause and the thing done. And when a countryman says the cold freezes water, though the word freezing seems to import some action, yet truly it signifies nothing but the effect, viz. that water that was before fluid, is become hard and consistent, without containing any idea of the action whereby it is done.

§ 12. *Mixed modes made also of other ideas.*—I think I shall not need to remark here, that though power and action make the greatest part of mixed modes, marked by names, and familiar in the minds and mouths of men; yet other simple ideas, and their several combinations, are not excluded; much less, I think, will it be necessary for me to enumerate all the mixed modes which have been settled with names to them. That would be to make a dictionary of the great part of the words made use of in divinity, ethics, law, and politics, and several other

sciences. All that is requisite to my present design, is to shew what sort of ideas those are, which I call mixed modes; how the mind comes by them; and that they are compositions made up of simple ideas got from sensation and reflection; which, I suppose, I have done.

CHAP. XXIII.

OF OUR COMPLEX IDEAS OF SUBSTANCES.

§ 1. *Ideas of substances, how made.*—The mind being, as I have declared, furnished with a great number of the simple ideas conveyed in by the senses, as they are found in exterior things, or by reflection on its own operations, takes notice also that as certain numbers of these simple ideas go constantly together; which being presumed to belong to one thing, and words being suited to common apprehensions, and made use of for quick dispatch, are called, so united in one subject, by one name; which, by inadvertency, we are apt afterwards to talk of, and consider, as one simple idea, which indeed is a complication of many ideas together: because, as I have said, not imagining how these simple ideas can subsist by themselves, we accustom ourselves to suppose some substratum, wherein they do subsist, and from which they do result; which, therefore, we call substance.*

* This section, which was intended only to shew how the individuals of distinct species of substances came to be looked upon as simple ideas, and so to have simple names, viz. from the supposed substratum of substance, which was looked upon as the thing itself in which inhered, and from which resulted, that complication of ideas, by which it was represented to us, hath been mistaken for an account of the idea of substance in general; and as such, hath been represented in these words: But how comes the general idea of substance to be framed in our minds? Is this by abstracting and enlarging simple ideas? No: "But it is by a complication of many simple ideas together: because, not imagining how these simple ideas can subsist by themselves, we accustom ourselves to suppose some substratum, wherein they do subsist, and from whence they do result; which, therefore, we call substance." And is this all, indeed, that is to be said for the being of substance, That we accustom ourselves to suppose a substratum? Is that custom grounded upon true reason, or not? If not, then accidents or modes must subsist of themselves; and these simple ideas need no tortoise to support them; for figures and colours, &c., would do well enough of themselves, but for some fancies men have accustomed themselves to.

To which objection of the Bishop of Worcester, our author^a answers thus: "Herein your lordship seems to charge me with two faults: one, That I make the general idea of substances to be framed, not by abstracting and enlarging simple ideas, but by a complication of many simple ideas together; the other, as if I had said, the being or substance had no other foundation than the fancies of men.

"As to the first of these I beg leave to remind your lordship, that I say in more places than one, and particularly Book 3., Chap. 3., § 6., and Book 1., Chap. 11., § 9., where, *ex professo*, I treat of abstraction and general ideas, that they are all made by abstracting, and, therefore, could not be understood to mean, that that of substance was made any other way; however my pen might have slipt, or the negligence of expression, where I might have something else than the general idea of substance in view might make me seem to say so.

"That I was not speaking of the general idea of substance, in the passage your lordship quotes, is manifest from the title of that chapter, which is, 'Of the complex ideas of substances:' and the first section of it, which your lordship cites for those words you have set down.

"In which words I do not observe any that deny the general idea of substance to be made by abstracting, nor any that say it is made by a complication of many simple ideas together. But speaking in that place of the ideas of distinct substances, such as man, horse, gold, &c., I say they are made up of certain combinations of simple ideas, which combinations are looked upon, each of them, as one simple idea, though they are many; and we call it by one name of substance, though made up of modes, from the custom of supposing

^a In his first letter to the Bishop of Worcester.

§ 2. *Our idea of substance in general.*—So that if any one will examine himself concerning his notion of pure substance in general, he will find he has no other idea of it at all, but only a supposition of he knows not what support of such qualities, which are capable of producing simple ideas in us; which qualities are commonly called accidents. If any one should be asked, what is the subject wherein colour or weight inheres, he would have nothing to say, but the solid extended parts: and if he were demanded what is it that solidity and extension adhere in, he would not be in a much better case than the Indian before-mentioned, who saying that the world was supported by a great elephant, was asked, what the elephant rested on? To which his answer was, a great tortoise: but being again pressed to know what gave support to the broad-backed tortoise, replied, something, he knew not what. And thus here, as in all other cases, where we use words without having clear and distinct ideas, we talk like children; who being questioned what such a thing is, which they know not, readily give this

a substratum, wherein that combination does subsist. So that in this paragraph I only give an account of the idea of distinct substances, such as oak, elephant, iron, &c., how they are made up of distinct complications of modes, yet they are looked on as one idea, called by one name, as making distinct sorts of substance.

“But that my notion of substance is general, is quite different from these, and has no such combination of simple ideas in it, is evident from the immediate following words, where I say, ^a ‘The idea of pure substance in general, is only a supposition of we know not what support of such qualities as are capable of producing simple ideas in us.’ And these two I plainly distinguish all along, particularly where I say, ‘whatever, therefore, be the secret and abstract nature of substance in general, all the ideas we have of particular distinct substances, are nothing but several combinations of simple ideas, coexisting in such, though unknown cause of their union, as makes the whole subsist of itself.’

“The other thing laid to my charge, is as if I took the being of substance to be doubtful, or rendered it so by the imperfect and ill-grounded idea I have given of it. To which I beg leave to say, that I ground not the being, but the idea of substance, on our accustoming ourselves to support some substratum; for it is of the idea alone I speak there, and not of the being of substance. And having every where affirmed, and built upon it, that a man is a substance, I cannot be supposed to question or doubt of the being of substance, till I can question or doubt of my own being. Farther, I say, ^b ‘Sensation convinces us that there are solid extended substances; and reflection, that there are thinking ones.’ So that, I think, the being of substance is not shaken by what I have said; and if the idea of it should be, yet (the being of things depending not on our ideas) the being of substance would not be at all shaken by my saying, we had but an obscure imperfect idea of it, and that that idea came from our accustoming ourselves to suppose substratum; or indeed, if I should say, we had no idea of substance at all. For a great many things may be, and are granted to have a being, and be in nature, of which we have no ideas. For example: it cannot be doubted but there are distinct species of separate spirits, of which, yet we have no distinct ideas at all; it cannot be questioned but spirits have ways of communicating their thoughts, and yet we have no idea of it at all.

“The being then of substance being safe and secure, notwithstanding any thing I have said, let us see whether the idea of it be not so too. Your lordship asks, with concern, And is this all, indeed, that is to be said, for the being (if your lordship please, let it be the idea) of substance, that we accustom ourselves to suppose a substratum? Is that custom grounded upon true reason or no? I have said that it is grounded upon this, ^c ‘That we cannot conceive how simple ideas of sensible qualities should subsist alone; and, therefore, we suppose them to exist in, and to be supported by, some common subject; which we denote by the name substance.’ Which, I think, is a true reason, because it is the same your lordship grounds the supposition of a substratum on, in this very page; even on the repugnancy to our conceptions, that modes and actions should subsist by themselves. So that I have the good luck to agree here with your lordship: and consequently conclude, I have your approbation in this, that the substratum to modes or accidents, which is our idea of substance in general, is founded in this, ‘that we cannot conceive how modes or accidents can subsist by themselves.’”

^a B. 2. c. 23. § 2.

^b Ib. § 29.

^c B. 2. c. 23. Ib. § 4.

satisfactory answer, that it is something; which, in truth, signifies no more, when so used, either by children or men, but that they know not what; and that the thing they pretend to know, and talk of, is what they have no distinct idea of at all, and so are perfectly ignorant of it, and in the dark. The idea then we have, to which we give the general name substance, being nothing but the supposed, but unknown, support of those qualities we find existing, which, we imagine, cannot subsist *sine resubstante*, without something to support them, we call that support substantial; which, according to the true import of the word, is, in plain English, standing under, or upholding.*

* From this paragraph, there hath been raised an objection by the Bishop of Worcester, if our author's doctrine here, concerning ideas, had almost discarded substance out of the world: his words in this paragraph being brought to prove, that he is one of the gentlemen of this new way of reasoning, that have almost discarded substance out of the reasonable part of the world. To which our author replies:^a "This, my lord, is an accusation which your lordship will pardon me, if I do not readily know what to plead to, because I do not understand what it is almost to discard substance out of the reasonable part of the world. If your lordship means by it, that I deny, or doubt, that there is in the world any such thing as substance, that your lordship will acquit me of, when your lordship looks again into this 23d chapter of the second book, which you have cited more than once; where you will find these words, § 4., 'Whence, we talk or think of any particular sort of corporeal substances, as horse, stone, &c., though the idea we have of either of them, be but the complication or collection of those several simple ideas of sensible qualities which we use to find united in the thing called horse, or stone; yet, because we cannot conceive how they should subsist alone, nor one in another, we suppose them existing in, and supported by, some common subject, which support we denote by the name substance; though it is certain, we have no clear or distinct idea of that thing we suppose a support.' And again, § 5: 'The same happens concerning the operations of the mind, viz. thinking, reasoning, fearing, &c., which we considering not to subsist of themselves, nor apprehending how they can belong to body, or be produced by it, we are apt to think these the actions of some other substance, which we call spirit; whereby yet it is evident, that having no other idea or notion of matter, but something wherein those many sensible qualities, which affect our senses, do subsist, by supposing a substance, wherein thinking, knowing, doubting, and a power of moving, &c. do subsist, we have as clear a notion of the nature or substance of spirit, as we have of body; the one being supposed to be (without knowing what it is) the substratum to those simple ideas we have from without: and the other supposed (with a like ignorance of what it is) to be the substratum to those operations, which we experiment in ourselves within.' And again, § 6.: 'Whatever, therefore, be the secret nature of substance in general, all the ideas we have of particular distinct substances, are nothing but several combinations of simple ideas co-existing in such, though unknown cause of their union, as makes the whole subject of itself.' And I farther say, in the same section, 'that we suppose these combinations to rest in, and to be adherent to, that unknown common subject, which inheres not in any thing else.' And § 3: 'That our complex ideas of substances, besides all those simple ideas they are made up of, have always the confused idea of something to which they belong, and in which they subsist; and, therefore, when we speak of any sort of substance, we say it is a thing having such and such qualities; as body is a thing that is extended, figured, and capable of motion: spirit, a thing capable of thinking.

"These and the like fashions of speaking, intimate, that the substance is supposed always something besides the extension, figure, solidity, motion, thinking, or other observable idea, though we know not what it is.'

"Our idea of body,^b I say, is an extended solid substance; and our idea of soul, is of a substance that thinks.^c So that as long as there is any such thing as body or spirit in the world, I have done nothing towards the discarding substance out of the reasonable part of the world. Nay, as long as there is any simple idea or sensible quality left according to my way of arguing, substance cannot be discarded; because all simple ideas, all sensible qualities, carry with them a supposition of a substratum to exist in, and of a substance wherein they inhere: and of this, that whole chapter is so full, that I challenge any one who reads it, to think I have almost, or one jot, discarded substance out of the reasonable part of the world. And of this man, horse, sun, water, iron, diamond, &c., which I have mentioned of distinct sorts of substances, will be my witnesses, as long as any such thing remain in being, of which I say, 'That the idea of substances are such combinations of simple ideas, as are

^a In his first letter to that bishop.

^b B. 2. c. 23. § 22.

^c B. 2. c. 12. § 6.

§ 3. *Of the sorts of substances.*—An obscure and relative idea of substance in general, being thus made, we come to have the ideas of particular sorts of substances, by collecting such combinations of simple

taken to represent distinct particular things subsisting by themselves, in which the opposed or confused idea of substance is always the first and chief.^a

“If, by almost discarding substance out of the reasonable part of the world, your lordship means, that I have destroyed, and almost discarded, the true idea we have of it, by calling it a substratum,^a a supposition of we know not what support of such qualities as are capable of producing simple ideas in us, an obscure and relative idea;^b that without knowing what it is, it is that which supports accidents; so that of substance we have no idea of what it is, but only a confused obscure one of what it does; I must confess, this, and the like, I have said of our idea of substance: and should be very glad to be convinced by your lordship, or any body else, that I have spoken too meanly of it. He that would shew me a more clear and distinct idea of substance, would do me a kindness I should thank him for. But this is the best I can hitherto find, either in my own thoughts, or in the books of logicians: for their account or idea of it is, that it is *ens*, or *res per se subsistens, et substans accidentibus*; which, in effect, is no more, but that substance is a being or thing; or, in short, something, they know not what, or of which they have no clearer idea, than that it is something which supports accidents, or other simple ideas or modes, and is not supported itself, as a mode, or an accident. So that I do not see but Burgersdicius, Sanderson, and the whole tribe of logicians, must be reckoned by the gentlemen of this new way of reasoning, who have almost discarded substance out of the reasonable part of the world.

“But supposing, my lord, that I, or these gentlemen, logicians of note in the schools, should own that we have a very imperfect, obscure, inadequate idea of substance, would it not be a little too hard, to charge us with discarding substance out of the world? For what, almost discarding, and reasonable part of the world, signifies, I must confess I do not clearly comprehend: but let almost, and reasonable part, signify here what they will, for I dare say your lordship meant something by them; would not your lordship think you were a little hardly dealt with, if, for acknowledging yourself to have a very imperfect and inadequate idea of God, or of several other things which in this very treatise you confess our understandings come short in, and cannot comprehend, you should be accused to be one of these gentlemen that have almost discarded God, or those other mysterious things, whereof you contend we have very imperfect and inadequate ideas, out of the reasonable world? For I suppose your lordship means, by almost discarding out of the reasonable world, something that is blamable, for it seems not to be inserted for a commendation; and yet I think he deserves no blame, who owns the having imperfect, inadequate, obscure ideas, where he has no better; however, if it be inferred from thence, that either he almost excludes those things out of being, or out of rational discourse, if that he meant by the reasonable world; for the first of these will not hold, because the being of things in the world, depends not on our ideas: the latter, indeed, is true in some degree, but it is no fault; for it is certain, that where we have imperfect, inadequate, confused, obscure ideas, we cannot discourse and reason about those things so well, fully, and clearly, as if we had perfect, adequate, clear, and distinct ideas.”

Other objections are made against the following parts of this paragraph, by that reverend prelate, viz. “The repetition of the story of the Indian philosopher, and the talking like children about substance:” to which our author replies:

“Your lordship, I must own, with great reason, takes notice, that I paralleled, more than once, our idea of substance with the Indian philosopher’s he-knew-not-what, which supported the tortoise, &c.

“This repetition is, I confess, a fault in exact writing: but I have acknowledged and excused it, in these words, in my preface: ‘I am not ignorant how little I herein consult my own reputation, when I knowingly let my essay go with a fault so apt to disgust the most judicious, who are always the nicest readers.’ And there farther add, ‘That I did not publish my essay for such great masters of knowledge as your lordship; but fitted it to men of my own size, to whom repetitions might be sometimes useful.’ It would not, therefore, have been beside your lordship’s generosity (who were not intended to be provoked by this repetition) to have passed by such a fault as this, in one who pretends not beyond the lower rank of writers. But I see your lordship would have me exact, and without any faults; and I wish I could be so, the better to deserve your lordship’s approbation.

“My saying, ‘That when we talk of substance, we talk like children; who being asked a question about something which they know not, readily give this satisfactory answer, That it is something;’ your lordship seems mightily to lay it to heart in these words that follow; ‘If this be the truth of the case, we must still talk like children, and I know not how it can be

^a B. 2. c. 23. §. 1. § 2. § 3.

^b B. 2. c. 13. § 19.

ideas, as are by experience and observation of men's senses, taken notice of to exist together, and are, therefore, supposed to flow from the particular internal constitution, or unknown essence of that substance. Thus we come to have the ideas of a man, horse, gold, water, &c., of which substances, whether any one has any other clear idea, farther than

remedied. For if we cannot come at a rational idea of substance, we can have no principle of certainty to go upon in this debate.²

"If your lordship has any better and distincter idea of substance than mine is, which I have given an account of, your lordship is not at all concerned in what I have there said. But those whose idea of substance, whether a rational or not rational idea, is like mine, something, they know not what, must in that, with me, talk like children, when they speak of something, they know not what. For a philosopher that says, that which supports accidents, is something, he knows not what; and a countryman that says, the foundation of the great church at Harlem is supported by something, he knows not what: and a child that stands in the dark, upon his mother's muff, says he stands upon something, he knows not what, in this respect, talk all three alike. But if the countryman knows that the foundation of the church at Harlem is supported by a rock, as the houses about Bristol are; or by gravel, as the houses in London are; or by wooden piles, as the houses in Amsterdam are; it is plain, that then having a clear and distinct idea of the thing that supports the church, he does not talk of this matter as a child; nor will he of the support of accidents, when he has a clearer and more distinct idea of it, than that it is barely something. But as long as we think like children, in cases where our ideas are no clearer or distincter than theirs, I agree with your lordship, that I know not how it can be remedied, but that we must talk like them."

Farther, the bishop asks, "Whether there be no difference between the bare being of a thing, and its subsistence by itself?" To which our author answers: "Yes.^a But what will that do to prove, that upon my principles, we can come to no certainty of reason, that there is any such thing as substance? You seem by this question to conclude, that the idea of a thing that subsists by itself, is a clear and distinct idea of substance; but, I beg leave to ask, Is the idea of the manner of subsistence of a thing, the idea of the thing itself? if it be not, we may have a clear and distinct idea of the manner, and yet have none but a very obscure and confused one of the thing. For example: I tell your lordship, that I know a thing that cannot subsist without a support, and I know another thing that does subsist without a support, and say no more of them; can you, by having the clear and distinct ideas of having a support, and not having a support, say, that you have a clear and distinct idea of the thing, that I know which has, and of the thing that I know which has not a support? If your lordship can, I beseech you to give me the clear and distinct ideas of these, which I only call by the general name, things, that have or have not supports: for such there are, and such I shall give your lordship clear and distinct ideas of, when you shall please to call upon me for them; though I think your lordship will scarce find them by the general and confused idea of things, nor in the clearer and more distinct idea of having, or not having, support."

"To shew a blind man that he has no clear and distinct idea of scarlet, I tell him, that is notion of it, that it is a thing or being, does not prove that he has any clear and distinct idea of it; but barely that he takes it to be something, he knows not what. He replies, that he knows more than that, v. g. he knows that it subsists, or inheres in another thing; and there is no difference, says he in your lordship's words, between the bare being of a thing, and its subsistence in another? Yes, say I to him, a great deal, they are very different ideas. But for all that, you have no clear and distinct idea of scarlet, nor such a one as I have, who see and know it, and have another kind of idea of it, besides that of inherence."

"Your lordship has the idea of subsisting by itself, and, therefore, you conclude you have a clear and distinct idea of the thing that subsists by itself; which, methinks, is all one, as your countryman should say, he hath an idea of the cedar of Lebanon, that it is a tree of that nature to need no prop to lean on for its support; therefore, he hath a clear and distinct idea of a cedar of Lebanon; which clear and distinct idea, when he comes to examine, is nothing but a general one of a tree, with which his indetermined idea of a cedar is confounded. Just so is the idea of substance; which, however clear and distinct, is confounded with the general indetermined idea of something. But suppose that the manner of subsisting by itself, gives us a clear and distinct idea of substance, how does that prove, that upon my principles we can come to no certainty of reason, that there is any such thing as substance in the world? Which is the proposition to be proved."

^a Mr. Locke's third letter.

of certain simple ideas co-existing together, I appeal to every man's own experience. It is the ordinary qualities observable in iron, or a diamond, put together, that make the true complex idea of those substances which a smith or jeweller commonly knows better than a philosopher; who, whatever substantial forms he may talk of, has no other idea of those substances than what is framed by a collection of those simple ideas which are to be found in them; only we must take notice that our complex ideas of substances, besides all those simple ideas they are made up of, have always the confused idea of something to which they belong, and in which they subsist; and, therefore, when we speak of any sort of substance, we say it is a thing having such or such qualities, as body is a thing that is extended, figured, and capable of motion; spirit, a thing capable of thinking; and so hardness, friability, and power to draw iron, we say, are qualities, to be found in a loadstone. These and the like fashions of speaking intimate, that the substance is supposed always something besides the extension, figure, solidity, motion, thinking, or other observable ideas, though we know not what it is.

§ 4. *No clear idea of substance in general.*—Hence, when we talk or think of any particular sort of corporeal substances, as horse, stone, &c., though the idea we have of either of them, be but the complication, or collection, of those several simple ideas of sensible qualities, which we use to find united in the thing called horse, or stone; yet because we cannot conceive how they should subsist alone, nor one in another, we suppose them existing in, and supported by some common subject; which support we denote by the name substance, though it be certain we have no clear or distinct idea of that thing we suppose a support.

§ 5. *As clear an idea of spirit as body.*—The same thing happens concerning the operations of the mind, viz. thinking, reasoning, fearing, &c., which we concluding not to subsist of themselves, nor apprehending how they can belong to any body, or be produced by it, we are apt to think these the actions of some other substance which we call spirit; whereby, yet, it is evident, that having no other idea, or notion of matter, but something wherein those many sensible qualities, which affect our senses, do subsist; by supposing a substance, wherein thinking, knowing, doubting, and a power of moving, &c., do subsist, we have as clear a notion of the substance of spirit, as we have of body; the one being supposed to be (without knowing what it is) the substratum to those simple ideas we have from without; and the other supposed (with a like ignorance of what it is) to be the substratum to those operations we experiment in ourselves within. It is plain, then, that the idea of corporeal substance in matter, is as remote from our conceptions and apprehensions, as that of spiritual substance, or spirit; and therefore, from our not having any notion of the substance of spirit, we can no more conclude its non-existence, than we can, for the same reason, deny the existence of body; it being as rational to affirm, there is no body, because we have no clear and distinct idea of the substance of matter, as to say, there is no spirit, because we have no clear and distinct idea of the substance of a spirit.

§ 6. *Of the sorts of substances.*—Whatever, therefore, be the secret abstract nature of substances in general, all the ideas we have of particular distinct sorts of substances, are nothing but several combinations of simple ideas, co-existing in such, though unknown, cause of their union, as to make the whole subsist of itself. It is by such combinations of simple ideas, and nothing else, that we represent particular sorts of substances to ourselves: such are the ideas we have of their several species in our minds; and such only do we, by their specific names, signify to others, v. g. man, horse, sun, water, iron; upon hearing which words, every one who understands the language, frames in his mind a combination of those several simple ideas, he has usually observed, or fancied to exist together, under that denomination; all which he supposes to rest in, and be, as it were, adherent to that unknown common subject, which adheres not in anything else. Though in the mean time, it be manifest, and every one, upon inquiry into his own thoughts, will find that he has no other idea of any substance, v. g., let it be gold, horse, iron, man, vitriol, bread, but what he has barely of those sensible qualities which he supposes to inhere, with a supposition of such a substratum, as gives, as it were, a support to those qualities, or simple ideas, which he has observed to exist, united together. Thus, the idea of the sun, what is it but an aggregate of those several simple ideas, bright, hot, roundish, having a constant regular motion, at a certain distance from us, and, perhaps, some other? As he who thinks and discourses of the sun, has been more or less accurate in observing those sensible qualities, ideas, or properties, which are in that thing which he calls the sun.

§ 7. *Power a great part of our complex ideas of substances.*—For he has the most perfect idea of any of the particular sorts of substances, who has gathered and put together most of those simple ideas which do exist in it, among which are to be reckoned its active powers, and passive capacities; which, though not simple ideas, yet, in this respect, for brevity's sake, may, conveniently enough, be reckoned amongst them. Thus, the power of drawing iron is one of the ideas of the complex one of that substance we call a loadstone; and a power to be so drawn, is a part of the complex one we call iron; which powers pass for inherent qualities in those subjects. Because every substance being as apt, by the powers we observe in it, to change some sensible qualities in other subjects, as it is to produce in us those simple ideas which we receive immediately from it, does by those new sensible qualities introduced into other subjects, discover to us those powers which do thereby immediately affect our senses, as regularly as its sensible qualities do it immediately: v. g. we immediately by our senses, perceive in fire its heat and colour; which are, if rightly considered, nothing but powers in it to produce those ideas in us: we also, by our senses, perceive the colour and brittleness of charcoal, whereby we come by the knowledge of another power in fire, which it has to change the colour and consistency of wood. By the former, fire immediately; by the latter, it immediately discovers to us these several qualities, which, therefore, we look upon to be a part of the qualities of fire, and so make them a part of the complex ideas of it. For all those powers that

we take cognizance of, terminating only in the alteration of some sensible qualities in those subjects on which they operate, and so making them exhibit to us new sensible ideas; therefore it is that I have reckoned these powers amongst the simple ideas which make the complex ones of the sorts of substances; though these powers, considered in themselves, are truly complex ideas. And, in this looser sense, I crave leave to be understood, when I name any of these potentialities amongst the simple ideas which we recollect in our minds, when we think of particular substances. For the powers that are severally in them, are necessary to be considered, if we will have true distinct notions of the several sorts of substances.

§ 8. *And why.*—Nor are we to wonder that powers make a great part of our complex ideas of substances; since their secondary qualities are those, which, in most of them, serve principally to distinguish substances one from another, and commonly make a considerable part of the complex idea of the several sorts of them. For our senses failing us in the discovery of the bulk, texture, and figure of the minute parts of bodies, on which their real constitutions and differences depend, we are fain to make use of their secondary qualities, as the characteristic notes and marks whereby to frame ideas of them in our mind, and distinguish them one from another. All which secondary qualities, as has been shewn, are nothing but bare powers. For the colour and taste of opium, are, as well as its soporific or anodyne virtues, mere powers, depending on its primary qualities, whereby it is fitted to produce different operations on different parts of our bodies.

§ 9. *Three sorts of ideas make our complex ones of substances.*—The ideas that make our complex ones of corporeal substances, are of these three sorts. *First*, The ideas of the primary qualities of things, which are discovered by our senses, and are in them, even when we perceive them not; such are the bulk, figure, number, situation, and motion of the parts of bodies, which are really in them, whether we take notice of them or no. *Secondly*, The sensible secondary qualities, which depending on these, are nothing but the powers those substances have to produce several ideas in us by our senses; which ideas are not in the things themselves, otherwise than as any thing is in its cause. *Thirdly*, The aptness we consider in any substance, to give or receive such alterations of primary qualities, as that the substance so altered should produce in us different ideas from what it did before; these are called active and passive powers, all which powers, as far as we have any notice or notion of them, terminate only in sensible simple ideas. For whatever alteration a loadstone has the power to make in the minute particles of iron, we should have no notion of any power it had at all to operate on iron, did not its sensible motion discover it; and I doubt not, but there are a thousand changes that bodies we daily handle have a power to cause in one another, which we never suspect, because they never appear in sensible effects.

§ 10. *Powers make a great part of our complex ideas of substances.*—Powers, therefore, justly make a great part of our complex ideas of substances. He that will examine his complex idea of gold, will find several of its ideas, that make it up, to be only powers, as the power of

being melted, but of not spending itself in the fire; of being dissolved in *aqua regia*; are ideas as necessary to make up our complex ideas of gold, as its colour and weight: which, if duly considered, are also nothing but different powers. For to speak truly, yellowness is not actually in gold; but is a power in gold to produce that idea in us by our eyes, when placed in a due light: and the heat, which we cannot leave out of our ideas of the sun, is no more really in the sun, than the white colour it introduces into wax. These are both equally powers in the sun, operating by the motion and figure of its sensible parts so on a man, as to make him have the idea of heat; and so on wax, as to make it capable to produce in a man the idea of white.

§ 11. *The new secondary qualities of bodies would disappear, if we could discover the primary ones of their minute parts.*—Had we senses acute enough to discern the minute particles of bodies, and the real constitution on which their sensible qualities depends, I doubt not but they would produce quite different ideas in us; and that which is now the yellow colour of gold, would then disappear, and instead of it, we should see an admirable texture of parts of a certain size and figure. This microscopes plainly discover to us: for what to our naked eyes produces a certain colour, is, by thus augmenting the acuteness of our senses, discovered to be quite a different thing; and the thus altering, as it were, the proportion of the bulk of the minute parts of a coloured object to our usual sight, produces different ideas from what it did before. Thus sand, or pounded glass, which is opaque and white to the naked eye, is pellucid in a microscope; and a hair seen this way, loses its former colour, and is in a great measure pellucid, with a mixture of some bright sparkling colours, such as appear from the refraction of diamonds, and other pellucid bodies. Blood, to the naked eye, appears all red; but by a good microscope, wherein its lesser parts appear, shews only some few globules of red swimming in a pellucid liquor; and how these red globules would appear, if glasses could be found that could yet magnify them 1000, or 10,000 times more, is uncertain.

§ 12. *Our faculties of discovery suited to our state.*—The infinitely wise Contriver of us, and all things about us, hath fitted our senses, faculties, and organs, to the conveniences of life, and the business we have to do here. We are able, by our senses, to know and distinguish things; and to examine them so far, as to apply them to our uses, and several ways to accommodate the exigencies of this life. We have insight enough into their admirable contrivances, and wonderful effects, to admire and magnify the wisdom, power, and goodness of their Author. Such a knowledge as this, which is suited to our present condition, we want not faculties to attain. But it appears not that God intended we should have a perfect, clear, and adequate knowledge of them: that perhaps is not in the comprehension of any finite being. We are furnished with faculties (dull and weak as they are) to discover enough in the creatures, to lead us to the knowledge of the Creator, and the knowledge of our duty; and we are fitted well enough with abilities to provide for the conveniences of living: these are our business in this world. But were our senses altered, and made much

quicker and acuter, the appearance and outward scheme of things would have quite another face to us; and I am apt to think, would be inconsistent with our being, or at least well-being, in this part of the universe which we inhabit. He that considers how little our constitution is able to bear a remove into parts of this air, not much higher than that we commonly breathe in, will have reason to be satisfied, that in this globe of earth allotted for our mansion, the all-wise Architect has suited our organs, and the bodies that are to affect them, one to another. If our sense of hearing were but one thousand times quicker than it is, how would a perpetual noise distract us? And we should, in the quietest retirement, be less able to sleep or meditate, than in the middle of a sea-fight. Nay, if that most instructive of our senses, seeing, were in any man one thousand, or one hundred thousand times, more acute than it is by the best microscope, things several millions of times less than the smallest object of his sight now, would then be visible to his naked eyes, and so he would come nearer to the discovery of the texture and motion of the minute parts of corporeal things; and in many of them, probably, get ideas of their internal constitutions: but then he would be in a quite different world from other people: nothing would appear the same to him, and others: the visible ideas of every thing would be different. So that I doubt, whether he, and the rest of men, could discourse concerning the objects of sight, or have any communication about colours, their appearances being so wholly different. And, perhaps, such a quickness and tenderness of sight could not endure bright sun-shine, or so much as open day-light; nor take in but a very small part of any object at once, and that too only at a very near distance. And if by the help of such microscopical eyes (if I may so call them) a man could penetrate farther than ordinary into the secret composition and radical texture of bodies, he would not make any great advantage by the change, if such an acute sight would not serve to conduct him to the market and exchange; if he could not see things he was to avoid at a convenient distance, nor distinguish things he had to do with, by those sensible qualities others do. He that was sharp-sighted enough to see the configuration of the minute particles of the spring of a clock, and observe upon what peculiar structure and impulse its elastic motion depends, would no doubt discover something very admirable; but if eyes so framed, could not view at once the hand and the character of the hour-plate, and thereby at a distance see what a clock it was, their owner could not be much benefited by that acuteness; which, whilst it discovered the secret contrivance of the parts of the machine, made him lose its use.

§ 13. *Conjecture about spirits.*—And here give me leave to propose an extravagant conjecture of mine, viz. That since we have some reason (if there be any credit to be given to the report of things that our philosophy cannot account for) to imagine, that spirits can assume to themselves bodies of different bulk, figure, and conformation of parts; whether one great advantage some of them have over us, may not lie in this, that they can so frame and shape to themselves organs of sensation or perception, as to suit them to their present design, and the circumstances of the object they would consider. For how much would

that man exceed all others in knowledge, who had but the faculty so to alter the structure of his eyes, that one sense, as to make it capable of all the several degrees of vision which the assistance of glasses (casually at first lighted on) has taught us to conceive? What wonders would he discover, who could so fit his eyes to all sorts of objects, as to see, when he pleased, the figure and motion of the minute particles in the blood, and other juices of animals, as distinctly as he does, at other times, the shape and motion of the animals themselves? But to us, in our present state, unalterable organs, so contrived, as to discover the figure and motion of the minute parts of bodies, whereon depend those sensible qualities we now observe in them, would, perhaps, be of no advantage. God has, no doubt, made them so, as is best for us in our present condition. He hath fitted us for the neighbourhood of the bodies that surround us, and we have to do with: and though we cannot, by the faculties we have, attain to a perfect knowledge of things, yet they will serve us well enough for those ends above mentioned, which are our great concernment. I beg my reader's pardon, for laying before him so wild a fancy, concerning the ways of perception in beings above us: but how extravagant soever it be, I doubt whether we can imagine any thing about the knowledge of angels, but after this manner, some way or other, in proportion to what we find and observe in ourselves. And though we cannot but allow, that the infinite power and wisdom of God, may frame creatures with a thousand other faculties, and ways of perceiving things without them, than what we have, yet our thoughts can go no farther than our own, so impossible it is for us to enlarge our very guesses beyond the ideas received from our own sensation and reflection. The supposition, at least, that angels do sometimes assume bodies, needs not startle us, since some of the most ancient and most learned fathers of the church, seemed to believe that they had bodies: and this is certain, that their state and way of existence is unknown to us.

§ 14. *Complex ideas of substances.*—But to return to the matter in hand; the ideas we have of substances, and the ways we come by them; I say, our specific ideas of substances are nothing else but a collection of a certain number of simple ideas, considered as united in one thing. These ideas of substances, though they are commonly simple apprehensions, and the names of them simple terms; yet, in effect, are complex and compounded. Thus the idea which an Englishman signifies by the name swan, is white colour, long neck, red beak, black legs, and whole feet, and all these of a certain size, with a power of swimming in the water, and making a certain kind of noise; and, perhaps, to a man who has long observed this kind of birds, some other properties, which all terminate in sensible simple ideas, all united in one common subject.

§ 15. *Idea of spiritual substances, as clear as of bodily substances.*—Besides the complex ideas we have of material sensible substances, of which I have last spoken, by the simple ideas we have taken from those operations of our own minds, which we experiment daily in ourselves, as thinking, understanding, willing, knowing, and power of beginning motion, &c., co-existing, in some substance; we are able to frame the complex idea of an immaterial spirit. And thus, by putting together the ideas of thinking, perceiving, liberty, and power of moving

themselves and other things, we have as clear a perception and notion of immaterial substances, as we have of material. For putting together the ideas of thinking and willing, or the power of moving, or quieting corporeal motion, joined to substance, of which we have no distinct idea, we have the idea of an immaterial spirit; and by putting together the ideas of coherent solid parts, and a power of being moved, joined with substance, of which likewise we have no positive idea, we have the idea of matter. The one is as clear and distinct an idea, as the other; the idea of thinking, and moving a body, being as clear and distinct ideas, as the ideas of extension, solidity, and being moved. For our idea of substance is equally obscure, or none at all, in both; it is but a supposed I know not what, to support those ideas we call accidents. It is for want of reflection that we are apt to think that our senses shew us nothing but material things. Every act of sensation, when duly considered, gives us an equal view of both parts of nature, the corporeal and spiritual. For whilst I know, by seeing, or hearing, &c., that there is some corporeal being without me, the object of that sensation, I do more certainly know, that there is some spiritual being within me, that sees and hears. This I must be convinced cannot be the action of bare insensible matter; nor ever could be without an immaterial thinking being.

§ 16. *No idea of abstract substance.*—By the complex idea of extended, figured, coloured, and all other sensible qualities, which is all that we know of it, we are as far from the idea of the substance of body, as if we knew nothing at all; nor after all the acquaintance and familiarity which we imagine we have with matter, and the many qualities men assure themselves they perceive and know in bodies, will it, perhaps, upon examination, be found, that they have any more, or clearer, primary ideas belonging to body, than they have belonging to immaterial spirit.

§ 17. *The cohesion of solid parts, and impulse, the primary ideas of body.*—The primary ideas we have peculiar to body, as contra-distinguished to spirit, are the cohesion of solid, and consequently separable, parts, and a power of communicating motion by impulse. These, I think, are the original ideas proper and peculiar to body; for figure is but the consequence of finite extension.

§ 18. *Thinking and motivity, the primary ideas of spirit.*—The ideas we have belonging and peculiar to spirit, are thinking, and will, or a power of putting body into motion by thought, and, which is consequent to it, liberty. For as body cannot but communicate its motion by impulse to another body, which it meets with at rest, so the mind can put bodies into motion, or forbear to do so, as it pleases. The ideas of existence, duration, and mobility, are common to them both.

§ 19. *Spirits capable of motion.*—There is no reason why it should be thought strange that I make mobility belong to spirit: for having no other idea of motion, but change of distance, with other beings that are considered as at rest; and finding that spirits, as well as bodies, cannot operate but where they are, and that spirits do operate at several times in several places, I cannot but attribute change of place to all finite

spirits (for of the infinite spirit I speak not here). For my soul being a real being, as well as my body, is certainly as capable of changing distance with any other body, or being as body itself, and so is capable of motion. And if a mathematician can consider a certain distance, or a change of that distance, between two points, one may certainly conceive a distance, and a change of distance, between two spirits; and so conceive their motion, their approach or removal, one from another.

§ 20. Every one finds in himself, that his soul can think, will, and operate on his body, in the place where that is; but cannot operate on a body, or in a place, a hundred miles distant from it. Nobody can imagine that his soul can think, or move a body, at Oxford, whilst he is at London; and cannot but know, that being united to his body, it constantly changes place all the whole journey, between Oxford and London, as the coach or horse does that carries him; and, I think, may be said to be truly all that while in motion; or if that will not be allowed to afford us a clear idea enough of its motion, its being separated from the body in death, I think will: for to consider it as going out of the body, or leaving it, and yet to have no idea of its motion, seems to me impossible.

§ 21. If it be said by any one, that it cannot change place, because it hath none, for spirits are not in *loco*, but *ubi*; I suppose that way of talking will not now be of much weight to many in an age that is not much disposed to admire, or suffer themselves to be deceived by, such unintelligible ways of speaking. But if any one thinks there is any sense in that distinction, and that it is applicable to our present purpose, I desire him to put it into intelligible English; and then from thence draw a reason to shew that immaterial spirits are not capable of motion; indeed, motion cannot be attributed to God, not because he is an immaterial, but because he is an infinite, spirit.

§ 22. *Idea of soul and body compared.*—Let us compare our complex idea of immaterial spirit, with our complex idea of body, and see whether there be any more obscurity in one than in the other, and in which most. Our idea of body, as I think, is an extended solid substance, capable of communicating motion by impulse: and our idea of soul, as an immaterial spirit, is of a substance that thinks, and has a power of exciting motion in body, by willing, or thought. These, I think, are our complex ideas of soul and body, as contra-distinguished; and now let us examine which has most obscurity in it, and difficulty to be apprehended. I know that people, whose thoughts are immersed in matter, and have so subjected their minds to their senses, that they seldom reflect on any thing beyond them, are apt to say, that they cannot comprehend a thinking thing; which, perhaps, is true: but I affirm, when they consider it well, they can no more comprehend an extended thing.

§ 23. *Cohesion of solid parts in body, as hard to be conceived as thinking in a soul.*—If any one say, he knows not what it is thinks in him; he means, he knows not what the substance is of that thinking thing; no more, say I, knows he what the substance is of that solid thing. Farther, if he says, he knows not how he thinks; I answer, neither knows he how he is extended; how the solid parts of body are

united, or cohere together to make extension. For though the pressure of the particles of air, may account for the cohesion of several parts of matter that are grosser than the particles of air, and have pores less than the corpuscles of air; yet the weight or pressure of the air will not explain, nor can be a cause of the coherence of, the particles of air themselves. And if the pressure of the ether, or any subtler matter than the air, may unite and hold fast together the parts of a particle of air, as well as other bodies; yet it cannot make bonds for itself, and hold together the parts that make up every the least corpuscle of that *materia subtilis*. So that the hypothesis, how ingeniously soever explained, by shewing, that the parts of sensible bodies are held together by the pressure of other external insensible bodies, reaches not the parts of the ether itself; and by how much the more evident it proves that the parts of other bodies are held together by the external pressure of the ether, and can have no other conceivable cause of their cohesion and union, by so much the more it leaves us in the dark concerning the cohesion of the parts of the corpuscles of the ether itself; which we can neither conceive without parts, they being bodies, and divisible; nor yet how their parts cohere, they wanting that cause of cohesion which is given of the cohesion of the parts of all other bodies.

§ 24. But, in truth, the pressure of any ambient fluid, how great soever, can be no intelligible cause of the cohesion of the solid parts of matter. For though such a pressure may hinder the avulsion of two polished superficies one from another, in a line perpendicular to them, as in the experiment of two polished marbles; yet it can never, in the least, hinder the separation by a motion in a line parallel to those surfaces: because the ambient fluid, having a full liberty to succeed in each point of space deserted by a lateral motion, resists such a motion of bodies so joined, no more than it would resist the motion of that body, were it on all sides environed by that fluid, and touched no other body: and, therefore, if there were no other cause of cohesion, all parts of bodies must be easily separable by such a lateral sliding motion. For if the pressure of the ether be the adequate cause of cohesion, wherever that cause operates not, there can be no cohesion. And since it cannot operate against such a lateral separation (as has been shewn), therefore in every imaginary plane, intersecting any mass of matter, there could be no more cohesion, than of two polished surfaces, which will always, notwithstanding any imaginable pressure of a fluid, easily slide one from another. So that, perhaps, how clear an idea soever we think we have of the extension of body, which is nothing but the cohesion of solid parts, he that shall well consider it in his mind, may have reason to conclude, that it is as easy for him to have a clear idea how the soul thinks, as how body is extended. For since body is no farther, nor otherwise extended, than by the union and cohesion of its solid parts, we shall very ill comprehend the extension of body, without understanding wherein consists the union and cohesion of its parts; which seems to me as incomprehensible as the manner of thinking, and how it is performed.

§ 25. I allow it is usual for most people to wonder how any one should find a difficulty in what they think they every day observe. Do

we not see, will they be ready to say, the parts of bodies stick firmly together? Is there any thing more common? And what doubt can there be made of it? And the like, I say, concerning thinking, and voluntary motion: do we not every moment experiment it in ourselves, and therefore can it be doubted? The matter of fact is clear, I confess; but when we would a little nearer look into it, and consider how it is done, there, I think, we are at a loss, both in the one and the other; and can as little understand how the parts of body cohere, as how we ourselves perceive, or move. I would have any one intelligibly explain to me, how the parts of gold, or brass (that but now in fusion were as loose from one another, as the particles of water, or the sands of an hour-glass), come in a few moments to be so united, and adhere so strongly one to another, that the utmost force of men's arms cannot separate them; a considering man will, I suppose, be here at a loss to satisfy his own or another man's understanding.

§ 26. The little bodies that compose that fluid we call water, are so extremely small, that I never heard of any one, who by a microscope (and yet I have heard of some that have magnified to ten thousand; nay, to much above one hundred thousand times) pretended to perceive their distinct bulk, figure, or motion: and the particles of water are also so perfectly loose one from another, that the least force sensibly separates them. Nay, if we consider their perpetual motion, we must allow them to have no cohesion one with another; and yet let but a sharp cold come, and they unite, they consolidate, these little atoms cohere, and are not, without great force, separable. He that could find the bonds that tie these heaps of loose little bodies together so firmly; he that could make known the cement that makes them stick so fast one to another, would discover a great, and yet unknown, secret; and yet when that was done, would he be far enough from making the extension of body (which is the cohesion of its solid parts) intelligible, till he could shew wherein consisted the union, or consolidation, of the parts of those bonds, or of that cement, or of the least particle of matter that exists. Whereby it appears that this primary and supposed obvious quality of body, will be found, when examined, to be as incomprehensible as any thing belonging to our minds, and a solid extended substance, as hard to be conceived, as a thinking immaterial one, whatever difficulties some would raise against it.

§ 27. For, to extend our thoughts a little farther, that pressure which is brought to explain the cohesion of bodies, is as unintelligible as the cohesion itself. For if matter be considered, as no doubt it is, finite, let any one send his contemplation to the extremities of the universe, and there see what conceivable hoops, what bond, he can imagine to hold this mass of matter in so close a pressure together, from whence steel has its firmness, and the parts of a diamond their hardness and indissolubility. If matter be finite, it must have its extremes; and there must be something to hinder it from scattering asunder. If, to avoid this difficulty, any one will throw himself into the supposition and abyss of infinite matter, let him consider what light he thereby brings to the cohesion of body; and whether he be ever the nearer making it intelligible, by resolving it into a supposition, the most absurd and most

incomprehensible of all other; so far is our extension of body (which is nothing but the cohesion of solid parts) from being clearer, or more distinct, when we would inquire into the nature, cause, or manner of it, than the idea of thinking.

§ 28. *Communication of motion by impulse, or by thought equally intelligible.*—Another idea we have of body, is the power of communication of motion by impulse; and of our souls, the power of exciting of motion by thought. These ideas, the one of body, the other of our minds, every day's experience clearly furnishes us with; but if here again we inquire how this is done, we are equally in the dark. For in the communication of motion by impulse, wherein as much motion is lost to one body, as is got to the other, which is the most ordinary case, we can have no other conception, but of the passing of motion out of one body into another; which, I think, is as obscure and unconceivable, as how our minds move or stop our bodies by thought; which we every moment find they do. The increase of motion by impulse, which is observed or believed sometimes to happen, is yet harder to be understood. We have by daily experience, clear evidence of motion produced both by impulse and by thought; but the manner how, hardly comes within our comprehension; we are equally at a loss in both. So that, however we consider motion, and its communication either from body or spirit, the idea which belongs to spirit, is at least as clear as that which belongs to body. And if we consider the active power of moving, or, as I may call it, motivity, it is much clearer in spirit, than body, since two bodies, placed by one another, at rest, will never afford us the idea of a power in the one to move the other, but by a borrowed motion; whereas the mind every day affords us ideas of an active power of moving of bodies; and, therefore, it is worth our consideration, whether active power be not the proper attribute of spirits, and passive power, of matter. Hence may be conjectured, that created spirits are not totally separate from matter, because they are both active and passive. Pure spirit, viz., God, is only active; pure matter, is only passive; those beings that are both active and passive, we may judge to partake of both. But be that as it will, I think we have as many, and as clear ideas, belonging to spirit, as we have belonging to body, the substance of each being equally unknown to us; and the idea of thinking in spirit, as clear as of extension in body; and the communication of motion by thought, which we attribute to spirit, is as evident as that by impulse which we ascribe to body. Constant experience makes us sensible of both these, though our narrow understandings can comprehend neither. For when the mind would look beyond those original ideas we have from sensation or reflection, and penetrate into their causes and manner of production, we find still it discovers nothing but its own short-sightedness.

§ 29. To conclude: sensation convinces us that there are solid extended substances; and reflection, that there are thinking ones; experience assures us of the existence of such beings; and that the one hath a power to move body by impulse, the other by thought; this we cannot doubt of. Experience, I say, every moment furnishes us with the clear ideas both of the one and the other. But beyond these ideas, as received

from their proper sources, our faculties will not reach. If we would inquire farther into their nature, causes, and manner, we perceive not the nature of extension clearer than we do of thinking. If we would explain them any farther, one is as easy as the other : and there is no more difficulty to conceive how a substance we know not, should, by thought, set body into motion, than how a substance we know not, should, by impulse, set body into motion. So that we are no more able to discover wherein the ideas belonging to body consist, than those belonging to spirit. From whence it seems probable to me, that the simple ideas we receive from sensation and reflection, are the boundaries of our thoughts ; beyond which, the mind, whatever efforts it would make, is not able to advance one jot ; nor can it make any discoveries, when it would pry into the nature and hidden causes of those ideas.

§ 30. *Idea of spirit and body compared.*—So that, in short, the idea we have of spirit, compared with the idea we have of body, stands thus : the substance of spirit is unknown to us ; and so is the substance of body equally unknown to us ; two primary qualities, or properties of body, viz. solid coherent parts and impulse, we have distinct clear ideas of ; so, likewise, we know and have distinct clear ideas of two primary qualities, or properties of spirit, viz. thinking, and a power of action ; i. e. a power of beginning, or stopping, several thoughts or motions. We have also the ideas of several qualities, inherent in bodies, and have the clear distinct ideas of them ; which qualities are but the various modifications of the extension of cohering solid parts, and their motion. We have, likewise, the ideas of the several modes of thinking, viz. believing, doubting, intending, fearing, hoping ; all which are but the several modes of thinking. We have also the ideas of willing and moving the body consequent to it, and with the body itself too ; for, as has been shewn, spirit is capable of motion.

§ 31. *The notion of spirit involves no more difficulty in it, than that of body.*—Lastly, If this notion of immaterial spirit may have, perhaps, some difficulties in it, not easy to be explained, we have, therefore, no more reason to deny or doubt the existence of such spirits, than we have to deny or doubt the existence of body ; because the notion of body is cumbered with some difficulties, very hard, and, perhaps, impossible, to be explained or understood by us. For I would fain have instanced any thing in our notion of spirit, more perplexed, or nearer a contradiction, than the very notion of body includes in it ; the divisibility, *in infinitum*, of any finite extension involving us, whether we grant or deny it, in consequences impossible to be explicated, or made in our apprehensions consistent ; consequences that carry greater difficulty, and more apparent absurdity, than any thing that can follow from the notion of an immaterial knowing substance.

§ 32. *We know nothing beyond our simple ideas.*—Which we are not at all to wonder at, since we having but some few superficial ideas of things, discovered to us only by the senses from without, or by the mind, reflecting on what it experiments in itself within, have no knowledge beyond that, much less of the internal constitution, and true nature of things, being destitute of faculties to attain it. And, therefore, experimenting and discovering in ourselves knowledge, and the

power of voluntary motion, as certainly as we experiment or discover in things without us, the cohesion and separation of solid parts, which is the extension and motion of bodies; we have as much reason to be satisfied with our notion of immaterial spirit, as with our notion of body; and the existence of the one, as well as the other. For it being no more a contradiction, that thinking should exist separate and independent from solidity, than it is a contradiction, that solidity should exist separate and independent from thinking, they being both but simple ideas, independent one from another; and having as clear and distinct ideas in us of thinking, as of solidity. I know not why we may not as well allow a thinking thing without solidity, i. e. immaterial, to exist, as a solid thing without thinking, i. e. matter to exist; especially since it is not harder to conceive how thinking should exist without matter, than how matter should think. For whensoever we would proceed beyond these simple ideas we have from sensation and reflection, and dive farther into the nature of things, we fall presently into darkness and obscurity, perplexedness and difficulties; and can discover nothing farther, but our own blindness and ignorance. But whichever of these complex ideas be clearest, that of body, or immaterial spirit, this is evident, that the simple ideas that make them up, are no other than what we have received from sensation or reflection, and so is it of all our other ideas of substances, even of God himself.

§ 33. *Idea of God.*—For if we examine the idea we have of the incomprehensible supreme Being, we shall find that we come by it the same way; and that the complex ideas we have both of God, and separate spirits, are made up of the simple ideas we receive from reflection: v. g. having, from what we experiment in ourselves, got the ideas of existence and duration; of knowledge and power; of pleasure and happiness; and of several other qualities and powers, which it is better to have than to be without: when we would frame an idea the most suitable we can to the supreme Being, we enlarge every one of these with our idea of infinite; and so putting them together, make our complex idea of God. For that the mind has such a power of enlarging some of its ideas, received from sensation and reflection, has been already shewn.

§ 34. If I find that I know some few things, and some of them, or all, perhaps, imperfectly, I can frame an idea of knowing twice as many; which I can double again, as often as I can add to number; and thus enlarge my idea of knowledge, by extending its comprehension to all things existing, or possible: the same also I can do of knowing them more perfectly; i. e. all their qualities, powers, causes, consequences, and relations, &c. till all be perfectly known that is in them, or can any way relate to them; and thus frame the idea of infinite or boundless knowledge: the same may also be done of power, till we come to that we call infinite; and also of the duration of existence, without beginning or end; and so frame the idea of an eternal being. The degrees, or extent, wherein we ascribe existence, power, wisdom, and all other perfections (which we can have any ideas of) to that sovereign Being, which we call God, being all boundless and infinite, we frame the best idea of him our minds are capable of: all which is done, I say, by en-

larging those simple ideas we have taken from the operations of our own minds, by reflection: or by our senses, from exterior things, to that vastness to which infinity can extend them.

§ 35. *Idea of God.*—For it is infinity which, joined to our ideas of existence, power, knowledge, &c. makes that complex idea, whereby we represent to ourselves, the best we can, the supreme Being. For though in his own essence, which certainly we do not know, not knowing the real essence of a pebble, or a fly, or of our own selves, God, be simple and uncompounded; yet, I think, I may say we have no other idea of him, but a complex one of existence, knowledge, power, happiness, &c. infinite and eternal: which are all distinct ideas, and some of them being relative, are again compounded of others; all which being, as has been shewn, originally got from sensation and reflection, go to make up the idea or notion we have of God.

§ 36. *No ideas in our complex one of spirits, but those got from sensation or reflection.*—This farther is to be observed, that there is no idea we attribute to God, bating infinity, which is not also a part of our complex idea of other spirits. Because, being capable of no other simple ideas, belonging to any thing but body, but those, which by reflection we receive from the operation of our minds, we can attribute to spirits no other but what we receive from thence: and all the difference we put between them in our contemplation of spirits, is only in the several extents and degrees of their knowledge, power, duration, happiness, &c. For that in our ideas, as well of spirits, as of other things, we are restrained to those we receive from sensation and reflection, is evident from hence, that in our ideas of spirits, how much soever advanced in perfection beyond those of bodies, even to that of infinite, we cannot yet have any idea of the manner wherein they discover their thoughts one to another; though we must necessarily conclude, that separate spirits, which are beings that have more perfect knowledge, and greater happiness than we, must needs have also a more perfect way of communicating their thoughts than we have, who are fain to make use of corporeal signs, and particular sounds, which are therefore of most general use, as being the best and quickest we are capable of. But of immediate communication, having no experiment in ourselves, and, consequently, no notion of it at all, we have no idea, how spirits, which use not words, can with quickness, or much less how spirits, that have no bodies, can be masters of their own thoughts, and communicate or conceal them at pleasure, though we cannot but necessarily suppose they have such a power.

§ 37. *Recapitulation.*—And thus we have seen what kind of ideas we have of substances of all kinds, wherein they consist, and how we come by them. From whence, I think, it is very evident,

First, That all our ideas of the several sorts of substances, are nothing but collections of simple ideas, with a supposition of something to which they belong, and in which they subsist; though of this supposed something we have no clear distinct idea at all.

Secondly, That all the simple ideas that, thus united in one common substratum, make up our complex ideas of several sorts of the substances, are no other but such as we have received from sensation or

reflection. So that even in those which we think we are most intimately acquainted with, and that come nearest the comprehension of our most enlarged conceptions, we cannot go beyond those simple ideas. And even in those which seem most remote from all we have to do with, and do infinitely surpass any thing we can perceive in ourselves by reflection, or discover by sensation in other things, we can attain to nothing but those simple ideas which we originally received from sensation or reflection, as is evident in the complex ideas we have of angels, and particularly of God himself.

Thirdly, That most of the simple ideas that make up our complex ideas of substances, when truly considered, are only powers, however we are apt to take them for positive qualities; v. g. the greatest part of the ideas that make our complex idea of gold, are yellowness, great weight, ductility, fusibility, and solubility, in *aqua regia*, &c. all united together in an unknown substratum; all which ideas are nothing else but so many relations to other substances, and are not really in the gold considered barely in itself, though they depend on those real and primary qualities of its internal constitution, whereby it has a fitness differently to operate, and be operated on by several other substances.

CHAP. XXIV.

OF COLLECTIVE IDEAS OF SUBSTANCES.

§ 1. *One idea.*—Besides these complex ideas of several single substances, as of man, horse, gold, violet, apple, &c. the mind hath also complex collective ideas of substances; which I so call, because such ideas are made up of many particular substances considered together, as united into one idea, and which so joined, are looked on as one; v. g. the idea of such a collection of men as make an army, though consisting of a great number of distinct substances, is as much one idea, as the idea of a man: and the great collective idea, of all bodies whatsoever, signified by the name world, is as much one idea, as the idea of any the least particle of matter in it; it sufficing to the unity of any idea, that it be considered as one representation, or picture, though made up of ever so many particulars.

§ 2. *Made by the power of composing in the mind.*—These collective ideas of substances the mind makes by its power of composition, and uniting severally, either simple or complex ideas into one, as it does by the same faculty make the complex ideas of particular substances, consisting of an aggregate of divers simple ideas, united in one substance: and as the mind, by putting together the repeated ideas of unity, makes the collective mode, or complex idea, of any number, as a score, or a gross, &c.: so by putting together several particular substances, it makes collective ideas of substances, as a troop, an army, a swarm, a city, a fleet; each of which, every one finds, that he represents to his own mind, by one idea, in one view; and so under that notion, considers those several things as perfectly one, as one ship, or one atom. Nor is it harder to conceive how an army of ten thousand men should make one idea, than how a man should make one idea; it being as easy to

the mind to unite into one, the idea of a great number of men, and consider it as one, as it is to unite into one particular, all the distinct ideas that make up the composition of a man, and consider them altogether as one.

§ 3. *All artificial things are collective ideas.*—Amongst such kind of collective ideas, are to be counted most part of artificial things, at least such of them as are made up of distinct substances: and, in truth, if we consider all these collective ideas aright, as army, constellation, universe, as they are united into so many single ideas, they are but the artificial draughts of the mind, bringing things very remote, and independent on one another, into one view, the better to contemplate and discourse of them, united into one conception, and signified by one name. For there are no things so remote, nor so contrary, which the mind cannot, by this art of composition, bring into one idea, as is visible in that signified by the name universe.

CHAP. XXV.

OF RELATION.

§ 1. *Relation, what.*—Besides the ideas, whether simple or complex, that the mind has of things, as they are in themselves, there are others it gets from their comparison one with another. The understanding, in the consideration of any thing, is not confined to that precise object: it can carry any idea, as it were, beyond itself, or, at least, look beyond it, to see how it stands in conformity to any other. When the mind so considers one thing, that it does, as it were, bring it to, and set it by, another, and carry its view from one to the other: this is, as the words import, relation and respect; and the denominations given to positive things, intimating that respect, and serving as marks to lead the thoughts beyond the subject itself denominated, to something distinct from it, are what we call relatives: and the things so brought together, related. Thus, when the mind considers Caius as such a positive being, it takes nothing into that idea but what really exists in Caius; v. g. when I consider him as a man, I have nothing in my mind but the complex idea of the species, man. So likewise, when I say Caius is a white man, I have nothing but the bare consideration of a man, who hath that white colour. But when I give Caius the name husband, I intimate some other person: and when I give him the name whiter, I intimate some other thing. In both cases, my thought is led to something beyond Caius, and there are two things brought into consideration. And since any idea, whether simple or complex, may be the occasion why the mind thus brings two things together, and, as it were, takes a view of them at once, though still considered as distinct; herefore, any of our ideas may be the foundation of relation. As in the above-mentioned instance, the contract and ceremony of marriage with Sempronius, is the occasion of the denomination or relation of husband; and the colour white, the occasion why he is said to be whiter than free-stone.

§ 2. *Relations without correlative terms, not easily perceived.*—These, and the like relations expressed by relative terms that have others answering them, with a reciprocal intimation, as father and son, bigger and less, cause and effect, are very obvious to every one, and every body at first sight perceives the relation. For father and son husband and wife, and such other correlative terms, seems so nearly to belong one to another, and, through custom, do so readily chime, and answer one another, in people's memories, that upon the naming of either of them, the thoughts are presently carried beyond the thing so named; and nobody overlooks, or doubts of, a relation, where it is so plainly intimated. But where languages have failed to give correlative names, there the relation is not always so easily taken notice of. Concubine is, no doubt, a relative name, as well as wife: but in languages where this, and the like words, have not a correlative term, there people are not so apt to take them to be so, as wanting that evident mark of relation which is between correlatives, which seem to explain one another, and not to be able to exist, but together. Hence it is, that many of those names, which, duly considered, do include evident relations, have been called external denominations. But all names that are more than empty sounds, must signify some idea, which is either in the thing to which the name is applied; and then it is positive, and is looked on as united to, and existing in, the thing to which the denomination is given: or else it arises from the respect the mind finds in it, to something distinct from it, with which it considers it; and then it concludes a relation.

§ 3. *Some seemingly absolute terms contain relations.*—Another sort of relative terms there is, which are not looked on to be either relative, or so much as external, denominations; which yet, under the form and appearance of signifying something absolute in the subject, do conceal a tacit, though less observable, relation. Such are the seemingly positive terms of old, great, imperfect, &c., whereof I shall have occasion to speak more at large in the following chapters.

§ 4. *Relation different from the things related.*—This farther may be observed, that the ideas of relation may be the same in men, who have far different ideas of the things that are related, or that are thus compared; v. g. those who have far different ideas of a man, may yet agree in the notion of a father: which is a notion superinduced to the substance, or man, and refers only to an act of that thing called man; whereby he contributes to the generation of one of his own kind, let man be what it will.

§ 5. *Change of relation may be without any change in the subject.*—The nature, therefore, of relation, consists in the referring or comparing two things one to another; from which comparison, one or both comes to be denominated. And if either of those things be removed, or cease to be, the relation ceases, and the denomination consequent to it, though the other receive in itself no alteration at all: v. g. Caius whom I consider to-day as a father, ceases to be so to-morrow, only by the death of his son, without any alteration made in himself. Nay barely by the mind's changing the object to which it compares an thing, the same thing is capable of having contrary denominations a

the same time : v. g. Caius, compared to several persons, may be truly said to be older and younger, stronger and weaker, &c.

§ 6. *Relation only betwixt two things.*—Whatsoever doth, or can exist, or be considered as one thing, is positive : and so not only simple ideas, and substances, but modes also, are positive beings ; though the parts of which they consist, are very often relative one to another ; but the whole together considered as one thing, producing in us the complex idea of one thing, which idea is in our minds, as one picture, though an aggregate of divers parts, and under one name, it is a positive or absolute thing, or idea. Thus a triangle, though the parts thereof, compared one to another, be relative, yet the idea of the whole is a positive absolute idea. Thesame may be said of a family, a tune, &c., for there can be no relation but betwixt two things, considered as two things. There must always be in relation two ideas, or things, either in themselves, really separate, or considered as distinct, and then a ground or occasion for their comparison.

§ 7. *All things capable of relation.*—Concerning relation in general, these things may be considered :

First, That there is no one thing, whether simple idea, substance, mode, or relation, or name of either of them, which is not capable of almost an infinite number of considerations, in reference to other things ; and, therefore, this makes no small part of men's thoughts and words : v. g. one single man may at once be concerned in, and sustain all these following relations, and many more, viz. father, brother, son, grandfather, grandson, father-in-law, son-in-law, husband, friend, enemy, subject, general, judge, patron, client, professor, European, Englishman, islander, servant, master, possessor, captain, superior, inferior, bigger, less, older, younger, contemporary, like, unlike, &c., to an almost infinite number : he being capable of as many relations, as there can be occasions of comparing him to other things, in any manner of agreement, disagreement, or respect whatsoever : for, as I said, relation is a way of comparing, or considering, two things together ; and giving one, or both of them, some appellation from that comparison, and sometimes giving even the relation itself a name.

§ 8. *The ideas of relations clearer often, than of the subjects related.*
—*Secondly,* This farther may be considered concerning relation, that though it be not contained in the real existence of things, but something extraneous and super-induced ; yet the ideas which relative words stand for, are often clearer, and more distinct, than of those substances to which they do belong. The notion we have of a father, or brother, is a great deal clearer and more distinct, than that we have of a man ; or, you will, paternity is a thing whereof it is easier to have a clearer idea, than of humanity ; and I can much easier conceive what a friend is, than what God ; because the knowledge of one action, or one simple idea, is oftentime sufficient to give me notion of a relation ; but to the knowing of any substantial being, an accurate collection of sundry ideas is necessary. A man, if he compares two things together, can hardly be supposed not to know what it is wherein he compares them ; so that when he compares any things together, he cannot but have a very clear idea of that relation. The ideas, then, of relations, are capable

at least of being more perfect and distinct in our minds, than those of substances; because it is commonly hard to know all the simple ideas which are really in any substance, but for the most part easy enough to know the simple ideas that make up any relation I think on, or have a name for; v. g. comparing two men, in reference to one common parent, it is very easy to frame the idea of brothers without having yet the perfect idea of a man. For significant relative words, as well as others, standing only for ideas; and those being all either simple, or made up of simple, ones, it suffices, for the knowing the precise idea the relative term stands for, to have a clear conception of that which is the foundation of the relation; which may be done without having a perfect and clear idea of the thing it is attributed to. Thus having the notion that one laid the egg out of which the other was hatched, I have a clear idea of the relation of dam and chick, between the two cassio-varies in St. James's Park; though, perhaps, I have but a very obscure and imperfect idea of those birds themselves.

§ 9. *Relations all terminate in simple ideas.*—*Thirdly*, Though there be a great number of considerations wherein things may be compared one with another, and so a multitude of relations; yet they all terminate in, and are concerned about, those simple ideas, either of sensation or reflection, which I think to be the whole materials of all our knowledge. To clear this, I shall shew it in the most considerable relations that we have any notion of; and in some that seem to be the most remote from sense or reflection; which yet will appear to have their ideas from thence, and leave it past doubt, that the notions we have of them are but certain simple ideas, and so originally derived from sense or reflection.

§ 10. *Terms leading the mind beyond the subject denominated, are relative.*—*Fourthly*, That relation being the considering of one thing with another, which is extrinsical to it, it is evident, that all words that necessarily lead the mind to any other ideas than are supposed really to exist in that thing to which the word is applied, are relative words; v. g. a man black, merry, thoughtful, thirsty, angry, extended; these, and the like, are all absolute, because they neither signify nor intimate any thing, but what does, or is supposed really to, exist, in the man thus denominated; but father, brother, king, husband, blacker, merrier, &c. are words, which, together with the thing they denominate, imply also something else separate, and exterior to the existence of that thing.

§ 11. *Conclusion.*—Having laid down these premises concerning relation in general, I shall now proceed to shew, in some instances, how all the ideas we have of relation are made up, as the others are, only of simple ideas; and that they all, how refined or remote from sense soever they seem, terminate at last in simple ideas. I shall begin with the most comprehensive relation, wherein all things that do or can exist are concerned, and that is, the relation of cause and effect. The idea whereof, how derived from the two fountains of all our knowledge, sensation and reflection, I shall in the next place consider.

CHAP. XXVI.

OF CAUSE AND EFFECT, AND OTHER RELATIONS.

§ 1. *Whence their ideas got.*—In the notice that our senses take of the constant vicissitude of things, we cannot but observe, that several particular, both qualities and substances, begin to exist; and that they receive this their existence from the due application and operation of some other being. From this observation we get our ideas of cause and effect. That which produces any simple or complex idea, we denote by the general name cause; and that which is produced, effect. Thus finding, that in that substance which we call wax, fluidity, which is a simple idea, that was not in it before, is constantly produced by the application of a certain degree of heat, we call the simple idea of heat, in relation to fluidity in wax, the cause of it; and fluidity, the effect. So also finding that the substance of wood, which is a certain collection of simple ideas so called, by the application of fire, is turned into another substance, called ashes, i. e. another complex idea, consisting of a collection of simple ideas, quite different from that complex idea which we call wood; we consider fire, in relation to ashes, as cause, and the ashes, as effect. So that whatever is considered by us to conduce or operate to the producing any particular simple idea, or collection of simple ideas, whether substance, or mode, which did not before exist, hath thereby in our minds the relation of a cause, and so is denominated by us.

§ 2. *Creation, generation, making alteration.*—Having thus, from what our senses are able to discover in the operations of bodies on one another, got the notion of cause and effect, viz., that a cause is that which makes any other thing, either simple idea, substance, or mode, begin to be; and an effect is that which had its beginning from some other thing; the mind finds no great difficulty to distinguish the several originals of things into two sorts:

First, When the thing is wholly made new, so that no part thereof had ever exist before; as when a new particle of matter doth begin to exist, *in rerum natura*, which had before no being, and this we call reation.

Secondly, When a thing is made up of particles which did all of them before exist, but that very thing so constituted of pre-existing particles, which considered all together, make up such a collection of simple ideas, as had not any existence before, as this man, this egg, rose, or herry, &c. And this, when referred to a substance, produced in the ordinary course of nature, by an internal principle, but set on work by, and received from, some external agent, or cause, and working by insensible ways, which we perceive not, we call generation; when the cause is extrinsical, and the effect produced by a sensible separation, or *juxta* position of discernible parts, we call it making; and such are all artificial things. When any simple idea is produced, which was not in that subject before, we call it alteration. Thus a man is generated, a picture made, and either of them altered, when any new sensible qua-

lity, or simple idea, is produced in either of them, which was not there before; and the things thus made to exist, which were not there before, are effects: and those things which operated to the existence, causes. In which, and all other cases, we may observe that the notion of cause and effect has its rise from ideas received by sensation or reflection; and that this relation how comprehensive soever, terminates at last in them. For to have the idea of cause and effect, it suffices to consider any simple idea, or substance, as beginning to exist by the operation of some other, without knowing the manner of that operation.

§ 3. *Relations of time.*—Time and place are also the foundations of very large relations, and all finite beings at least are concerned in them. But having already shewn, in another place, how we get these ideas, it may suffice here to intimate, that most of the denominations of things received from time, are only relations; thus, when any one says that Queen Elizabeth lived sixty-nine, and reigned forty-five years, these words import only the relation of that duration to some other, and mean no more but this, that the duration of her existence was equal to sixty-nine, and the duration of her government, to forty-five, annual revolutions of the sun; and so are all words answering how long. Again, William the Conqueror invaded England about the year 1066, which means this: that taking the duration from our Saviours's time, till now, for one entire great length of time, it shews at what distance this invasion was from the two extremes; and so do all words of time, answering to the question when, which shew only the distance of any point of time, from the period of a longer duration, from which we measure, and to which we thereby consider it as related.

§ 4. There are yet, besides those other words of time that ordinarily are thought to stand for positive ideas, which yet will, when considered, be found to be relative; such as are young, old, &c., which include and intimate the relation any thing has to a certain length of duration, whereof we have the idea in our minds. Thus having settled in our thoughts the idea of the ordinary duration of a man to be seventy years, when we say a man is young, we mean that his age is yet but a small part of that which usually men attain to; and when we denominate him old, we mean, that his duration is run out almost to the end of that which men do not usually exceed. And so it is but comparing the particular age or duration of this or that man, to the idea of that duration which we have in our minds, as ordinarily belonging to that sort of animals; which is plain in the application of these names to other things; for a man is called young at twenty years, and very young at seven years old: but yet a horse we call old at twenty, and a dog at seven, years; because in each of these, we compare their age to different ideas of duration, which are settled in our mind as belonging to these several sorts of animals, in the ordinary course of nature. But the sun and stars, though they have out-lived several generations of men, we call not old, because we do not know what period God hath set to that sort of beings. This term belonging properly to those things which we can observe in the ordinary course of things, by a natural decay, to come to an end in a certain period of time; and so have in our minds, as it were, a standard to which we can compare the several parts of their duration; and by

the relation they bear thereunto, call them young, or old; which we cannot therefore do to a ruby, or diamond, things whose usual periods we know not.

§ 5. *Relations of place and extension.*—The relation also that things have to one another, in their places and distances, is very obvious to observe; as above, below, a mile distant from Charing Cross, in England, and in London. But as in duration, so in extension and bulk, there are some ideas that are relative, which we signify by names that are thought positive; as great and little, are truly relations. For here also having, by observation, settled in our minds the ideas of the bigness of several species of things, from those we have been most accustomed to, we make them, as it were, the standards whereby to denominate the bulk of others. Thus we call a great apple, such a one as is bigger than the ordinary sort of those we have been used to; and a little horse, such a one as comes not up to the size of that idea which we have in our minds to belong ordinarily to horses; and that will be a great horse to a Welchman, which is but a little one to a Fleming; they two having, from the different breed of their countries, taken several sized ideas to which they compare, and in relation to which they denominate, their great and their little.

§ 6. *Absolute terms often stand for relations.*—So likewise weak and strong are but relative denominations of power, compared to some ideas we have, at that time, of greater or less power. Thus when we say a weak man, we mean one that has not so much strength or power to move, as usually men have, or usually those of his size have; which is a comparing his strength to the idea we have of the usual strength of men, or men of such a size. The like when we say the creatures are all weak things; weak, there, is but a relative term, signifying the disproportion there is in the power of God and the creatures. And so abundance of words, in ordinary speech, stand only for relations (and, perhaps, the greatest part), which at first sight seem to have no such signification; v. g. the ship has necessary stores. Necessary and stores, are both relative words; one having a relation to the accomplishing the voyage intended, and the other to future use. All which relations, how they are confined to, and terminate in, ideas derived from sensation or reflection, is too obvious to need any explication.

CHAP. XXVII.

OF IDENTITY AND DIVERSITY.

§ 1. *Wherein identity consists.*—Another occasion the mind often takes of comparing, is the very being of things, when considering any thing as existing, at any determined time and place, we compare it with itself, existing at another time, and thereon, form the ideas of identity and diversity. When we see any thing to be in any place in any instant of time, we are sure (be it what it will) that it is that very thing, and not another, which at that same time exists in another place, how like and undistinguishable soever it may be in all other respects; and in this consists identity, when the ideas it is attributed to, vary not at all

from what they were that moment, wherein we consider their former existence, and to which we compare the present. For we never finding, nor conceiving it possible, that two things of the same kind should exist in the same place at the same time, we rightly conclude, that whatever exists any where at any time, excludes all of the same kind, and is there itself alone. When, therefore, we demand whether any thing be the same or no? it refers always to something that existed such a time in such a place, which, it was certain, at that instant, was the same with itself, and no other; from whence it follows, that one thing cannot have two beginnings of existence, nor two things one beginning, it being impossible for two things of the same kind, to be or exist in the same instant, in the very same place, or one and the same thing, in different places. That, therefore, that had one beginning, is the same thing; and that which had a different beginning in time and place from that, is not the same, but diverse. That which has made the difficulty about this relation, has been the little care and attention used in having precise notions of the things to which it is attributed.

§ 2. *Identity of substances.*—We have the ideas but of three sorts of substances; 1, God. 2, Finite intelligences. 3, Bodies. *First*, God is without beginning, eternal, unalterable, and every where; and, therefore, concerning his identity, there can be no doubt. *Secondly*, Finite spirits having had each its determinate time and place of beginning to exist, the relation to that time and place will always determine to each of them its identity, as long as it exists. *Thirdly*, The same will hold of every particle of matter, to which no addition or subtraction of matter being made, it is the same. For though these three sorts of substances, as we term them, do not exclude one another out of the same place; yet we cannot conceive but that they must necessarily, each of them, exclude any of the same kind out of the same place; or else the notions and names of identity and diversity would be in vain, and there could be no such distinction of substances, or any thing else, one from another. For example: could two bodies be in the same place at the same time; then those two parcels of matter must be one and the same, take them great or little; nay, all bodies must be one and the same. For, by the same reason that two particles of matter may be in one place, all bodies may be in one place; which, when it can be supposed, takes away the distinction of identity and diversity of one and more, and renders it ridiculous. But it being a contradiction, that two or more should be one, identity and diversity are relations and ways of comparing well founded, and of use to the understanding.

Identity of modes.—All other things being but modes or relations ultimately terminated in substances, the identity and diversity of each particular existence of them too, will be, by the same way, determined; only as to things whose existence is in succession, such as are the actions of finite beings, v. g. motion and thought, both which consist in a continued train of succession, concerning their diversity, there can be no question; because each perishing the moment it begins, they cannot exist in different times, or in different places, as permanent beings can, at different times, exist in distant places; and, therefore, no motion

or thought, considered as at different times, can be the same, each part thereof having a different beginning of existence.

§ 3. *Principium individuationis*.—From what has been said, it is easy to discover what is so much inquired after, the *principium individuationis*; and that, it is plain, is existence itself, which determines a being of any sort to a particular time and place incommunicable to two beings of the same kind. This, though it seems easier to conceive in simple substances or modes, yet when reflected on, is not more difficult in compound ones, if care be taken to what it is applied; v. g., let us suppose an atom, i. e. a continued body, under one immutable superficies, existing in a determined time and place; it is evident, that considered in any instant of its existence, it is, in that instant, the same with itself. For being at that instant what it is, and nothing else, it is the same, and so must continue as long as its existence is continued; for so long it will be the same, and no other. In like manner, if two or more atoms be joined together into the same mass, every one of those atoms will be the same, by the foregoing rule. And whilst they exist united together, the mass, consisting of the same atoms, must be the same mass, or the same body, let the parts be ever so differently jumbled; but if one of these atoms be taken away, or one new one added, it is no longer the same mass, or the same body. In the state of the living creatures, their identity depends not on a mass of the same particles, but on something else. For in them the variation of great parcels of matters alters not the identity; an oak growing from a plant to a great tree, and then lopped, is still the same oak; and a colt grown up to a horse, sometimes fat, sometimes lean, is all the while the same horse; though, in both these cases, there may be a manifest change of the parts; so that truly they are not, either of them, the same masses of matter, though they be truly one of them, the same oak; and the other, the same horse. The reason whereof is, that in these two cases, a mass of matter, and a living body, identity is not applied to the same thing.

§ 4. *Identity of vegetables*.—We must, therefore, consider wherein an oak differs from a mass of matter, and that seems to me to be in this; that the one is only the cohesion of particles of matter any how united; the other, such a disposition of them, as constitutes the parts of an oak; and such an organization of those parts, as is fit to receive, and distribute nourishment, so as to continue and frame the wood, bark, and leaves, &c., of an oak, in which consists the vegetable life. That being then one plant, which has such an organization of parts in one coherent body, partaking of one common life, it continues to be the same plant, as long as it partakes of the same life, though that life be communicated to new particles of matter vitally united to the living plant, in a like continued organization, conformable to that sort of plants. For this organization being, at any one instant, in any one collection of matter, is in that particular concrete distinguished from all other, and is that individual life, which existing constantly from that moment both forwards and backwards, in the same continuity of insensibly succeeding parts united to the living body of the plant, it has that identity which makes the same plant, and all the parts of it, parts of the same plant, during all the time that they exist united in that continued

organization, which is fit to convey that common life to all the parts so united.

§ 5. *Identity of animals.*—The case is not so much different in brutes, but that any one may hence see what makes an animal, and continues it the same. Something we have like this in machines, and may serve to illustrate it. For example, what is a watch? It is plain it is nothing but a fit organization or construction of parts, to a certain end, which, when a sufficient force is added to it, it is capable to attain. If we would suppose this machine one continued body, all whose organized parts were repaired, increased, or diminished, by a constant addition or separation of insensible parts with one common life, we should have something very much like the body of an animal, with this difference, that in an animal, the fitness of the organization, and the motion wherein life consists, begin together, the motion coming from within: but in machines, the force coming sensibly from without, is often away when the organ is in order, and well fitted to receive it.

§ 6. *Identity of man.*—This also shews wherein the identity of the same man consists; viz. in nothing but a participation of the same continued life, by constantly fleeting particles of matter, in succession, vitally united to the same organized body. He that shall place the identity of man in any thing else, but like that of other animals, in one fitly organized body, taken in any one instant, and from thence continued, under one organization of life, in several successively fleeting particles of matter, united to it, will find it hard to make an embryo, one of years, mad and sober, the same man, by any supposition that will not make it possible for Seth, Ishmael, Socrates, Pilate, St. Austin, and Cæsar Borgia, to be the same man. For if the identity of soul alone, makes the same man, and there be nothing in the nature of matter, why the same individual spirit may not be united to different bodies, it will be possible that those men, living in distant ages, and of different tempers, may have been the same man; which way of speaking must be, from a very strange use of the word man, applied to an idea out of which body and shape are excluded; and that way of speaking would agree yet worse with the notions of those philosophers, who allow of transmigration, and are of opinion that the souls of men may, for their miscarriages, be detrued into the bodies of beasts, as fit habitations, with organs suited to the satisfaction of their brutal inclinations. But yet, I think, nobody, could he be sure that the soul of Heliogabalus were in one of his hogs, would yet say that hog were a man, or Heliogabalus.

§ 7. *Identity suited to the idea.*—It is not, therefore, unity of substance that comprehends all sorts of identity, or will determine it in every case; but to conceive and judge of it aright, we must consider what idea the word it is applied to, stands for; it being one thing to be the same substance; another, the same man; and a third, the same person; if person, man, and substance, are three names standing for three different ideas; for such as is the idea belonging to that name, such must be the identity; which, if it had been a little more carefully attended to, would possibly have prevented a great deal of that confusion which often occurs about this matter, with no small seeming diffi-

culties, especially concerning personal identity, which, therefore, we shall, in the next place, a little consider.

§ 8. *Same man.*—An animal is a living organized body; and frequently the same animal, as we have observed, is the same continued life communicated to different particles of matter, as they happen successively to be united to that organized living body. And whatever is talked of other definitions, ingenious observation puts it past doubt, that the idea in our minds, of which the sound man in our mouths is the sign, is nothing else but of an animal of such a certain form; since I think I may be confident, that whoever should see a creature of his own shape and make, though it had no more reason all its life than a cat or a parrot, would call him still a man; or, whoever should hear a cat or a parrot discourse, reason, and philosophize, would call or think it nothing but a cat or a parrot; and say, the one was a dull irrational man, and the other a very intelligent rational parrot. A relation we have in an author of great note, is sufficient to countenance the supposition of a rational parrot. His words* are,

“ I had a mind to know from Prince Maurice’s own mouth, the account of a common, but much credited, story, that I had heard so often from many others, of an old parrot he had in Brazil, during his government there, that spoke, and asked, and answered, common questions, like a reasonable creature; so that those of his train there, generally concluded it to be witchery or possession; and one of his chaplains, who lived long afterwards in Holland, would never, from that time, endure a parrot, but said, they all had a devil in them. I had heard many particulars of this story, and assevered by people hard to be discredited, which made me ask Prince Maurice what there was of it? He said, with his usual plainness and dryness in talk, there was something true, but a great deal false, of what had been reported. I desired to know of him what there was of the first? He told me short and coldly, that he had heard of such an old parrot when he had been at Brazil; and though he believed nothing of it, and it was a good way off, yet he had so much curiosity as to send for it; that it was a very great and a very old one; and when it came first into the room where the prince was, with a great many Dutchmen about him, it said presently, ‘What a company of white men are here!’ They asked it what it thought that man was? pointing at the prince. It answered, ‘Some general or other;’ when they brought it close to him, he asked it, *D’ou venez vous?* ‘Whence come ye?’ It answered, *De Marinnan.* ‘From Marinnan.’ The prince, *A qui estes-vous?* ‘To whom do you belong?’ Parrot, *A un Portugais.* ‘To a Portuguese.’ Prince, *Que fais-tu là?* ‘What do you there?’ The parrot, *Je garde les poules.* ‘I look after the chickens.’ The prince laughed, and said, *Vous gardez les poules?* ‘You look after the chickens?’ The parrot answered, *Oui, moi; et je sçais bien faire;* ‘Yes, I; and I know well enough how to do it;’ and made the chuck, four or five times, that people use to make to chickens when they call them. I set down the words of this worthy dialogue in French, just as Prince Maurice said them to me. I asked him in what language the parrot spoke? and he said in Brazilian. I

* Memoirs of what passed in Christendom, from 1672 to 1769, p. 3⁵⁷/₉₂.

asked whether he understood Brazilian? he said, no: but he had taken care to have two interpreters by him, the one, a Dutchman that spoke Brazilian, and the other, a Brazilian that spoke Dutch; that he asked them separately and privately, and both of them agreed in telling him just the same thing that the parrot had said. I could not but tell this odd story, because it is so much out of the way, and from the first hand, and what may pass for a good one; for I dare say this prince, at least, believed himself in all he told me, having ever passed for a very honest and pious man. I leave it to naturalists to reason, and to other men to believe, as they please upon it; however, it is not, perhaps, amiss to relieve or enliven a busy scene sometimes with such digressions, whether to the purpose or no."

Same man.—I have taken care that the reader should have the story at large in the author's own words, because he seems to me not to have thought it incredible; for it cannot be imagined that so able a man as he, who had sufficiency enough to warrant all the testimonies he gives of himself, should take so much pains, in a place where it had nothing to do, to pin so close, not only on a man whom he mentions as his friend, but on a prince, in whom he acknowledges very great honesty and piety, a story, which, if he himself thought incredible, he could not but also think ridiculous. The prince, it is plain, who vouches this story, and our author who relates it from him, both of them call this talker a parrot; and I ask any one else, who thinks such a story fit to be told, whether if this parrot, and all of its kind, had always talked, as we have a prince's word for it this one did; whether, I say, they would not have passed for a race of rational animals; but yet, whether, for all that, they would have been allowed to be men, and not parrots? For I presume it is not the idea of a thinking or rational being alone, that makes the idea of a man in most people's sense, but of a body, so and so shaped, joined to it; and if that be the idea of a man, the same successive body not shifted all at once, must, as well as the same immaterial spirit, go to the making of the same man.

§ 9. *Personal identity.*—This being premised, to find wherein personal identity consists, we must consider what person stands for; which, I think, is a thinking intelligent being, that has reason and reflection, and can consider itself, as itself, the same thinking thing in different times and places; which it does only by that consciousness which is inseparable from thinking, and, as it seems to me, essential to it; it being impossible for any one to perceive, without perceiving that he does perceive. When we hear, smell, taste, feel, meditate, or will any thing, we know that we do so. Thus it is always as to our present sensations and perceptions; and by this every one is to himself that which he calls self; it not being considered in this case, whether the same self be continued in the same or divers substances. For since consciousness always accompanies thinking, and it is that which makes every one to be what he calls self, and thereby distinguishes himself from all other thinking things; in this, alone, consists personal identity, i. e. the sameness of a rational being; and as far as this consciousness can be extended backwards, to any past action or thought, so far reaches the identity of that person; it is the same self now, it was then; and

it is by the same self with this present one, that now reflects on it, that that action was done.

§ 10. *Consciousness makes personal identity.*—But it is farther inquired, whether it be the same identical substance? This, few would think they had reason to doubt of, if those perceptions, with their consciousness, always remained present in the mind, whereby the same thinking thing would be always consciously present, and, as would be thought, evidently the same to itself. But that which seems to make the difficulty, is this, that this consciousness being interrupted always by forgetfulness, there being no moment of our lives wherein we have the whole train of all our past actions before our eyes in one view; but even the best memories losing the sight of one part, whilst they are viewing another: and we sometimes, and that the greatest parts of our lives, not reflecting on our past selves, being intent on our present thoughts; and in sound sleep, having no thoughts at all, or, at least, none with that consciousness which remarks our waking thoughts: I say, in all these cases, our consciousness being interrupted, and we losing the sight of our past selves, doubts are raised whether we are the same thinking thing, i. e. the same substance, or no; which, however reasonable, or unreasonable, concerns no personal identity at all: the question being, what makes the same person; and not whether it be the same identical substance, which always thinks in the same person; which in this case matters not at all: different substances, by the same consciousness (where they do partake in it), being united into one person, as well as different bodies, by the same life, are united into one animal, whose identity is preserved, in that change of substances, by the unity of one continued life. For it being the same consciousness that makes a man be himself to himself, personal identity depends on that only, whether it be annexed solely to one individual substance, or can be continued in a succession of several substances. For as far as any intelligent being can repeat the idea of any past action with the same consciousness it had of it at first, and with the same consciousness it has of any present action; so far it is the same personal self. For it is by the consciousness it has of its present thoughts and actions, that it is self to itself now, and so will be the same self, as far as the same consciousness can extend to actions past or to come; and would be by distance of time, or change of substance, no more two persons, than a man be two men, by wearing other clothes to-day than he did yesterday, with a long or a short sleep between; the same consciousness uniting those distant actions into the same person, whatever substances contributed to their production.

§ 11. *Personal identity in change of substances.*—That this is so, we have some kind of evidence in our very bodies, all whose particles, whilst vitally united to this same thinking conscious self, so that we feel when they are touched, and are affected by, and conscious of good or harm that happens to them, are a part of ourselves; i. e. of our thinking conscious self. Thus the limbs of his body are to every one a part of himself; he sympathizes and is concerned for them. Cut off a hand, and thereby separate it from that consciousness he had of its heat, cold, and other affections, and it is then no longer a part of that which is

himself, any more than the remotest part of matter. Thus we see the substance, whereof personal self consisted at one time, may be varied at another, without the change of personal identity; there being no question about the same person, though the limbs, which but now were a part of it, be cut off.

§ 12. *Whether in the change of thinking substances.*—But the question is, whether if the same substance, which thinks, be changed, it can be the same person; or remaining the same, it can be different persons.

And to this I answer, *First*, This can be no question at all to those who place thought in a purely material animal constitution, void of an immaterial substance. For, whether their supposition be true or no, it is plain they conceive personal identity preserved in something else than identity of substance; as animal identity is preserved in identity of life, and not of substance. And, therefore, those who place thinking in an immaterial substance only, before they can come to deal with these men, must shew why personal identity cannot be preserved in the change of immaterial substances, or variety of particular immaterial substances, as well as animal identity is preserved in the change of material substances, or variety of particular bodies; unless they will say, it is one immaterial spirit that makes the same life in brutes, as it is one immaterial spirit that makes the same person in men, which the Cartesians at least will not admit, for fear of making brutes thinking things too.

§ 13. But next, as to the first part of the question, “whether if the same thinking substance (supposing immaterial substances only to think) be changed, it can be the same person?” I answer, that cannot be resolved, but by those who know what kind of substances they are that do think; and whether the consciousness of past actions can be transferred from one thinking substance to another. I grant, were the same consciousness the same individual action, it could not: but it being but a present representation of a past action, why it may not be possible that that may be represented to the mind to have been, which really never was, will remain to be shewn. And, therefore, how far the consciousness of past actions is annexed to any individual agent, so that another cannot possibly have it, will be hard for us to determine, till we know what kind of action it is, that cannot be done without a reflex act of perception accompanying it, and how performed by thinking substances, who cannot think without being conscious of it. But that which we call the same consciousness, not being the same individual act, why one intellectual substance may not have represented to it, as done by itself, what it never did, and was perhaps done by some other agent: why, I say, such a representation may not possibly be without reality of matter of fact, as well as several representations in dreams are, which yet, whilst dreaming, we take for true, will be difficult to conclude from the nature of things. And that it never is so, will by us, till we have clearer views of the nature of thinking substances, be best resolved into the goodness of God, who, as far as the happiness or misery of any of his sensible creatures is concerned in it, will not, by a fatal error of theirs, transfer from one to another that consciousness which draws

reward or punishment with it. How far this may be an argument against those who would place thinking in a system of fleeting animal spirits, I leave to be considered. But yet, to return to the question before us, it must be allowed, that if the same consciousness (which, as has been shewn, is quite a different thing from the same numerical figure or motion in body) can be transferred from one thinking substance to another, it will be possible, that two thinking substances may make but one person. For the same consciousness being preserved, whether in the same or different substances, the personal identity is preserved.

§ 14. As to the second part of the question, "whether the same immaterial substance remaining, there may be two distinct persons?" Which question seems to me to be built on this, whether the same immaterial being, being conscious of the action of its past duration, may be wholly stripped of all the consciousness of its past existence, and lose it beyond the power of ever retrieving it again: and so, as it were, beginning a new account from a new period, have a consciousness that cannot reach beyond this new state. All those who hold pre-existence, are evidently of this mind, since they allow the soul to have no remaining consciousness of what it did in that pre-existent state, either wholly separate from body, or informing any other body; and if they should not, it is plain, experience would be against them. So that personal identity reaching no farther than consciousness reaches, a pre-existent spirit not having continued so many ages in a state of silence, must needs make different persons. Suppose a Christian, platonist, or pythagorean, should, upon God's having ended all his works of creation the seventh day, think his soul hath existed ever since; and would imagine it has revolved in several human bodies, as I once met with one, who was persuaded his had been the soul of Socrates (how reasonably I will not dispute. This I know, that in the post he filled, which was no inconsiderable one, he passed for a very rational man; and the press has shewn that he wanted not parts or learning), would any one say, that he being not conscious of any of Socrates's actions or thoughts, could be the same person with Socrates? Let any one reflect upon himself, and conclude, that he has in himself an immaterial spirit, which is that which thinks in him, and in the constant change of his body keeps him the same; and is that which he calls himself: let him also suppose it to be the same soul that was in Nestor or Thersites at the siege of Troy (for souls being, as far as we know any thing of them, in their nature indifferent to any parcel of matter, the supposition has no apparent absurdity in it), which it may have been, as well as it is now, the soul of any other man: but he now having no consciousness of any of the actions either of Nestor or Thersites, does, or can he, conceive himself the same person with either of them? Can he be concerned in either of their actions? Attribute them to himself, or think them his own, more than the actions of any other man that ever existed? so that this consciousness not reaching to any of the actions of either of those men, he is no more one self with either of them, than if the soul or immaterial spirit that now informs him, had been created, and began to exist, when it began to inform his present body, though it were ever

so true, that the same spirit that informed Nestor's or Thersites's body, were numerically the same that now informs his. For this would no more make him the same person with Nestor, than if some of the particles of matter that were once a part of Nestor, were now a part of this man; the same immaterial substance, without the same consciousness, no more making the same person by being united to any body, than the same particle of matter, without consciousness, united to any body, makes the same person. But let him once find himself conscious of any of the actions of Nestor, he then finds himself the same person with Nestor.

§ 15. And thus we may be able, without any difficulty, to conceive the same person at the resurrection, though in a body not exactly in make or parts the same which he had here, the same consciousness going along with the soul that inhabits it. But yet the soul alone, in the change of bodies, would scarce to any one, but to him that makes the soul the man, be enough to make the same man. For should the soul of a prince, carrying with it the consciousness of the prince's past life, enter and inform the body of a cobbler, as soon as deserted by his own soul, every one sees he would be the same person with the prince, accountable only for the prince's actions: but who would say it was the same man? The body too goes to the making the man, and would, I guess, to every body, determine the man in this case, wherein the soul, with all its princely thoughts about it, would not make another man: but he would be the same cobbler to every one besides himself. I know that in the ordinary way of speaking, the same person, and the same man, stand for one and the same thing. And, indeed, every one will always have a liberty to speak as he pleases, and to apply what articulate sounds, to what ideas he thinks fit, and change them as often as he pleases. But yet, when we will inquire what makes the same spirit, man, or person, we must fix the ideas of spirit, man, or person, in our minds; and having resolved with ourselves what we mean by them, it will not be hard to determine in either of them, or the like, when it is the same, and when not.

§ 16. *Consciousness makes the same person.*—But though the same immaterial substance or soul, does not alone, wherever it be, and in whatsoever state, make the same man; yet it is plain, consciousness, as far as ever it can be extended, should it be to ages past, unites existences and actions, very remote in time, into the same person, as well as it does the existences and actions of the immediately preceding moment: so that whatever has the consciousness of present and past actions, is the same person to whom they both belong. Had I the same consciousness that I saw the ark and Noah's flood, as that I saw an overflowing of the Thames last winter, or as that I write now, I could no more doubt that I who write this now, that saw the Thames overflowed last winter, and that viewed the flood at the general deluge, was the same self, place that self in what substance you please, than that I who write this am the same myself now, whilst I write (whether I consist of all the same substance, material or immaterial, or no), that I was yesterday. For as to this point of being the same self, it matters not whether this present self be made up of the same or other substances, I

being as much concerned, and as justly accountable, for any action that was done a thousand years since, appropriated to me now by this self consciousness, as I am for what I did the last moment.

§ 17. *Self depends on consciousness.*—Self is that conscious thinking thing, whatever substance made up of (whether spiritual or material, simple or compounded, it matters not), which is sensible, or conscious of pleasure and pain, capable of happiness or misery, and so is concerned for itself, as far as that consciousness extends. Thus every one finds, that whilst comprehended under that consciousness, the little finger is as much a part of itself, as what is most so. Upon separation of this little finger, should this consciousness go along with the little finger, and leave the rest of the body, it is evident the little finger would be the person, the same person; and self, then, would have nothing to do with the rest of the body. As, in this case, the consciousness that goes along with the substance, when one part is separate from another, which makes the same person, and constitutes this inseparable self; so it is in reference to substances remote in time. That with which the consciousness of this present thinking thing can join itself, makes the same person, and is one self with it, and with nothing else; and so attributes to itself, and owns all the actions of that thing as its own, as far as that consciousness reaches, and no farther; as every one who reflects will perceive.

§ 18. *Objects of reward and punishment.*—In this personal identity is founded all the right and justice of reward and punishment; happiness and misery being that for which every one is concerned for himself, and not mattering what becomes of any substance, not joined to, or affected with, that consciousness. For as it is evident in the instance I gave but now, if the consciousness went along with the little finger, when it was cut off, that would be the same self which was concerned for the whole body yesterday, as making part of itself, whose actions then, it cannot but admit as its own now. Though if the same body should still live, and immediately, from the separation of the little finger, have its own peculiar consciousness, whereof the little finger knew nothing, it would not at all be concerned for it, as a part of itself, or could own any of its actions, or have any of them imputed to him.

§ 19. This may shew us wherein personal identity consists; not in the identity of substance, but, as I have said, in the identity of consciousness, wherein, if Socrates and the present Mayor of Queenborough agree, they are the same person; if the same Socrates, waking and sleeping, do not partake of the same consciousness, Socrates waking and sleeping, is not the same person. And to punish Socrates waking, for what sleeping Socrates thought, and waking Socrates was never conscious of, would be no more of right, than to punish one twin for what his brother-twin thought, whereof he knew nothing, because their outsides were so like, that they could not be distinguished; for such twins have been seen.

§ 20. But yet possibly it will still be objected, suppose I wholly lose the memory of some parts of my life, beyond a possibility of retrieving them, so that perhaps I shall never be conscious of them again; yet am I not the same person that did those actions, had those thoughts that I once was conscious of, though I have now forgot them? to which I answer, that we must here take notice what the word I is applied to; which, in

this case, is the man only. And the same man being presumed to be the same person, I is easily here supposed to stand also for the same person. But if it be possible for the same man to have distinct incommunicable consciousness at different times, it is past doubt the same man would, at different times, make different persons; which, we see, is the sense of mankind in the solemnest declarations of their opinions, human laws not punishing the mad man for the sober man's actions, nor the sober man for what the mad man did, thereby making them two persons; which is somewhat explained by our way of speaking in English, when we say, such a one is not himself, or is beside himself; in which phrases it is insinuated, as if those who now, or at least, first used them, thought that self was changed, the self-same person was no longer in that man.

§ 21. *Difference between identity of man and person.*—But yet it is hard to conceive that Socrates, the same individual man, should be two persons. To help us a little in this, we must consider what is meant by Socrates, or the same individual man.

First, It must be either the same individual, immaterial, thinking substance; in short, the same numerical soul, and nothing else.

Secondly, Or the same animal, without any regard to an immaterial soul.

Thirdly, Or the same immaterial spirit united to the same animal.

Now, take which of these suppositions you please, it is impossible to make personal identity to consist in any thing but consciousness; or reach any farther than that does.

For by the first of them, it must be allowed possible, that a man born of different women, and in distant times, may be the same man. A way of speaking, which, whoever admits, must allow it possible for the same man to be two distinct persons, as any two that have lived in different ages, without the knowledge of one another's thoughts.

By the second and third, Socrates in this life, and after it, cannot be the same man, any way, but by the same consciousness; and so making human identity to consist in the same thing wherein we place personal identity, there will be no difficulty to allow the same man to be the same person. But then they who place human identity in consciousness only, and not in something else, must consider how they will make the infant Socrates the same man with Socrates after the resurrection. But whatsoever to some men makes a man, and consequently the same individual man, wherein perhaps few are agreed, personal identity can by us be placed in nothing but consciousness (which is that alone which makes what we call self), without involving us in great absurdities.

§ 22. But is not man, drunk and sober, the same person? why else is he punished for the fact he commits when drunk, though he be never afterwards conscious of it? just as much the same person, as a man that walks, and does other things in his sleep, is the same person, and is answerable for any mischief he shall do in it. Human laws punish both with a justice suitable to their way of knowledge; because, in these cases, they cannot distinguish certainly what is real, what counterfeit; and so the ignorance in drunkenness or sleep, is not admitted as a plea. For though punishment be annexed to personality, and personality to

consciousness, and the drunkard perhaps be not conscious of what he did; yet human judicatures justly punish him; because the fact is proved against him, but want of consciousness cannot be proved for him. But in the great day, wherein the secrets of all hearts shall be laid open, it may be reasonable to think no one shall be made to answer for what he knows nothing of; but shall receive his doom, his conscience accusing or excusing him.

§ 23. *Consciousness alone makes self.*—Nothing but consciousness can unite remote existences into the same person, the identity of substance will not do it; for whatever substance there is, however framed, without consciousness, there is no person; and a carcass may be a person, as well as any sort of substance be so, without consciousness.

Could we suppose two distinct incommunicable consciousnesses acting the same body, the one constantly by day, the other by night; and, on the other side, the same consciousness, acting by intervals, two distinct bodies; I ask, in the first case, whether the day and the night man would not be two as distinct persons, as Socrates and Plato? And whether in the second case, there would not be one person in two distinct bodies, as much as one man is the same in two distinct clothings. Nor is it at all material to say, that this same, and this distinct consciousness in the cases above-mentioned, is owing to the same and distinct immaterial substances, bringing it with them to those bodies, which, whether true or no, alters not the case; since it is evident the personal identity would equally be determined by the consciousness, whether that consciousness were annexed to some individual immaterial substance or no. For granting that the thinking substance in man must be necessarily supposed immaterial, it is evident that immaterial thinking thing may sometimes part with its past consciousness, and be restored to it again; as appears in the forgetfulness men often have of their past actions, and the mind many times recovers the memory of a past consciousness, which it had lost for twenty years together. Make these intervals of memory and forgetfulness to take their turns regularly by day and night, and you have two persons with the same immaterial spirit, as much as in the former instance, two persons with the same body. So that self is not determined by identity or diversity of substance, which it cannot be sure of, but only by identity of consciousness.

§ 24. Indeed it may conceive the substance whereof it is now made up, to have existed formerly, united in the same conscious being; but consciousness removed, that substance is no more itself, or makes no more a part of it, than any other substance; as is evident in the instance we have already given of a limb cut off, of whose heat, or cold, or other affections, having no longer any consciousness, it is no more of a man's self, than any other matter of the universe. In like manner, it will be in reference to any immaterial substance, which is void of that consciousness whereby I am myself to myself: if there be any part of its existence which I cannot, upon recollection, join with that present consciousness whereby I am now myself, it is in that part of its existence no more myself, than any other immaterial being. For whatsoever any substance has thought or done, which I cannot recollect, and by my

consciousness make my own thought and action, it will no more belong to me, whether a part of me thought or did it, than if it had been thought or done by any other immaterial being any where existing.

§ 25. I agree, the more probable opinion is, that this consciousness is annexed to, and the affection of, one individual immaterial substance.

But let men, according to their diverse hypotheses, resolve of that as they please. This every intelligent being, sensible of happiness or misery, must grant, that there is something that is himself, that he is concerned for, and would have happy; that his self has existed in a continued duration more than one instant, and therefore it is possible may exist, as it has done, months and years to come, without any certain bounds to be set to its duration; and may be the same self, by the same consciousness, continued on for the future. And thus, by his consciousness, he finds himself to be the same self which did such or such an action some years since, by which he comes to be happy or miserable now. In all which account of self, the same numerical substance is not considered as making the same self. But the same continued consciousness, in which several substances may have been united, and again separated from it, which, whilst they continued in a vital union with that wherein this consciousness then resided, made a part of that same self. Thus any part of our bodies vitally united to that which is conscious in us, makes a part of ourselves; but upon separation from the vital union, by which that consciousness is communicated, that which a moment since was part of ourselves, is now no more so, than a part of another man's self is part of me; and it is not impossible, but in a little time may become a real part of another person. And so we have the same numerical substance become a part of two different persons; and the same person preserved under the change of various substances. Could we suppose any spirit wholly stripped of all its memory or consciousness of past actions, as we find our minds always are of a great part of ours, and sometimes of them all, the union or separation of such a spiritual substance would make no variation of personal identity, any more than that of any particle of matter does. Any substance vitally united to the present thinking being, is a part of that very same self, which now is: any thing united to it by a consciousness of former actions, makes also a part of the same self, which is the same both then and now.

§ 26. *Person, a forensic term.*—Person, as I take it, is the name for this self. Wherever a man finds what he calls himself, there, I think, another may say is the same person. It is a forensic term, appropriating actions and their merit; and so belongs only to intelligent agents capable of a law, and happiness and misery. This personality extends itself beyond present existence to what is past, only by consciousness, whereby it becomes concerned and accountable, owns and imputes to itself past actions, just upon the same ground, and for the same reason, that it does the present. All which is founded in a concern for happiness, the unavoidable concomitant of consciousness, that which is conscious of pleasure and pain, desiring that that self that is conscious, should be happy. And therefore whatever past actions it cannot reconcile or appropriate to that present self by consciousness,

it can be no more concerned in, than if they had never been done : and to receive pleasure or pain, i. e. reward or punishment, on the account of any such action, is all one as to be made happy or miserable in its first being, without any demerit at all. For supposing a man punished now for what he had done in another life, whereof he could be made to have no consciousness at all, what difference is there between that punishment, and being created miserable? And therefore conformable to this, the apostle tells us, that at the great day, when every one shall "receive according to his doings, the secrets of all hearts shall be laid open." The sentence shall be justified by the consciousness all persons shall have, that they themselves, in what bodies soever they appear, or what substances soever that consciousness adheres to, are the same that committed those actions, and deserve that punishment for them.

§ 27. I am apt enough to think I have, in treating of this subject, made some suppositions that will look strange to some readers, and possibly they are so in themselves : but yet, I think, they are such as are pardonable in this ignorance we are in of the nature of that thinking thing that is in us, and which we look on as ourselves. Did we know what it was, or how it was tied to a certain system of fleeting animal spirits; or whether it could or could not perform its operations of thinking and memory out of a body organised as ours is; and whether it has pleased God that no one such spirit shall ever be united to any but one such body, upon the right constitution of whose organs its memory should depend, we might see the absurdity of some of those suppositions I have made. But taking, as we ordinarily now do (in the dark concerning these matters), the soul of a man, for an immaterial substance, independent from matter, and indifferent alike to it all, there can, from the nature of things, be no absurdity at all to suppose that the same soul may, at different times, be united to different bodies, and with them make up, for that time, one man : as well as we suppose a part of a sheep's body yesterday, should be a part of a man's body to-morrow, and in that union make a vital part of Melibœus himself, as well as it did of his ram.

§ 28. *The difficulty from ill use of names.*—To conclude : whatever substance begins to exist, it must, during its existence, necessarily be the same : whatever compositions of substances begin to exist, during the union of those substances, the concrete must be the same : whatsoever mode begins to exist, during its existence, it is the same : and so if the composition be of distinct substances, and different modes, the same rule holds. Whereby it will appear, that the difficulty or obscurity that has been about this matter, rather rises from the names ill used, than from any obscurity in things themselves. For whatever makes the specific idea, to which the name is applied, if that idea be steadily kept to, the distinction of any thing into the same, and divers, will easily be conceived, and there can arise no doubt about it.

§ 29. *Continued existence makes identity.*—For supposing a rational spirit be the idea of a man, it is easy to know what is the same man, viz., the same spirit, whether separate or in a body, will be the same man. Supposing a rational spirit vitally united to a body of a certain conformation of parts to make a man, whilst that rational spirit, with

that vital conformation of parts, though continued in a fleeting successive body, remains, it will be the same. But if to any one the idea of a man be but the vital union of parts in a certain shape; as long as that vital union and shape remain in a concrete no otherwise the same, but by a continued succession of fleeting particles, it will be the same man. For whatever be the composition whereof the complex idea is made, whenever existence makes it one particular thing under any denomination, the same existence continued, preserves it the same individual under the same denomination.*

* The doctrine of identity and diversity contained in this chapter, the Bishop of Worcester pretends to be inconsistent with the doctrines of the Christian faith, concerning the resurrection of the dead. His way of arguing from it, is this: he says, "The reason of believing the resurrection of the same body, upon Mr. Locke's grounds, is from the idea of identity." To which our author^a answers: "Give me leave, my lord, to say, that the reason of believing any article of the Christian faith (such as your lordship is here speaking of) to me, and upon my grounds, is its being a part of divine revelation: upon this ground I believed it, before I either writ that chapter of identity and diversity, and before I ever thought of those propositions which your lordship quotes out of that chapter; and, upon the same ground, I believe it still; and not from my idea of identity. This saying of your lordship's, therefore, being a proposition neither self-evident, nor allowed by me to be true, remains to be proved. So that your foundation failing, all your large superstructure built thereon, comes to nothing.

"But, my lord, before we go any farther, I crave leave humbly to represent to your lordship, that I thought you undertook to make out, that my notion of ideas was inconsistent with the articles of the Christian faith. But that which your lordship instances in here, is not, that I yet know, an article of the Christian faith. The resurrection of the dead, I acknowledge to be an article of the Christian faith: but that the resurrection of the same body, in your lordship's sense of the same body, is an article of the Christian faith, is what, I confess, I do not yet know.

"In the New Testament (wherein, I think, are contained all the articles of the Christian faith) I find our Saviour, and the apostles, to preach the resurrection of the dead, and the resurrection from the dead, in many places; but I do not remember any place, where the resurrection of the same body is so much as mentioned. Nay, which is very remarkable in the case, I do not remember in any place of the New Testament (where the general resurrection at the last day is spoken of), any such expression as the resurrection of the body, much less of the same body.

"I say the general resurrection at the last day; because, where the resurrection of some particular persons, presently upon our Saviour's resurrection, is mentioned, the words are,^b 'The graves were opened, and many bodies of saints, which slept, arose, and came out of the graves, after his resurrection, and went into the Holy City, and appeared to many:' of which peculiar way of speaking of this resurrection, the passage itself gives a reason in these words, 'appeared to many,' i. e. those who slept appeared, so as to be known to be risen. But this could not be known, unless they brought with them the evidence, that they were those who had been dead; whereof there were these two proofs, their graves were opened, and their bodies not only gone out of them, but appeared to be the same to those who had known them formerly alive, and knew them to be dead and buried. For if they had been those who had been dead so long, that all who knew them once alive, were now gone, those to whom they appeared might have known them to be men; but could not have known they were risen from the dead, because they never knew they had been dead. All that by their appearing they could have known, was, they were so many living strangers, of whose resurrection they knew nothing. It was necessary, therefore, that they should come in such bodies, as might in make and size, &c. appear to be the same they had before, that they might be known to those of their acquaintance, whom they appeared to. And it is probable they were such as were newly dead, whose bodies were not yet dissolved and dissipated; and, therefore, it is particularly said here (differently from what is said of the general resurrection) that their bodies arose; because they were the same, that were then lying in their graves, the moment before they rose.

"But your lordship endeavours to prove it must be the same body; and let us grant that your lordship, nay, and others too, think you have proved it must be the same body; will you, therefore, say, that he holds what is inconsistent with an article of faith, who having never seen this, your lordship's interpretation of the scripture, nor your reasons for the same

^a In his third letter to the Bishop of Worcester.

^b Matt. xxvii. 52, 53.

body, in your sense of same body; or, if he has seen them, yet not understanding them, or not perceiving the force of them, believes what the scripture proposes to him, viz. 'That at the last day, the dead shall be raised,' without determining whether it shall be with the very same bodies or no?

"I know your lordship pretends not to erect your particular interpretations of scripture into articles of faith. And if you do not, he that believes the dead shall be raised, believes that article of faith which the scripture proposes; and cannot be accused of holding any thing inconsistent with it, if it should happen, that what he holds is inconsistent with another proposition, viz. 'That the dead shall be raised with the same bodies,' in your lordship's sense, which I do not find proposed in Holy Writ as an article of faith.

"But your lordship argues, It must be the same body; which, as you explain same body,^a is not the same individual particles of matter which were united at the point of death; nor the same particles of matter that the sinner had at the time of the commission of his sins: but that it must be the same material substance which was vitally united to the soul here; i. e. as I understand it, the same individual particles of matter which were some time or other during his life here vitally united to his soul.

"Your first argument to prove that it must be the same body, in this sense of the same body, is taken from these words of our Saviour,^b 'All that are in the graves, shall hear his voice, and shall come forth:'^c from whence your lordship argues, that these words, 'All that are in their graves,' relate to no other substance than what was united to the soul in life; because, 'a different substance cannot be said to be in the graves, and to come out of them.' Which words of your lordship's, if they prove any thing, prove that the soul, too, is lodged in the grave, and raised out of it at the last day. For your lordship says, 'Can a different substance be said to be in the graves, and come out of them?' so that, according to this interpretation of these words of our Saviour, 'no other substance being raised, but what hears his voice; and no other substance hearing his voice, but what being called, comes out of the grave; and no other substance coming out of the grave, but what was in the grave;' any one must conclude, that the soul, unless it be in the grave, will make no part of the person that is raised, unless, as your lordship argues against me,^d you can make it out, that a substance which never was in the grave, may come out of it, or that the soul is no substance.

"But setting aside the substance of the soul, another thing that will make any one doubt, whether this, your interpretation of our Saviour's words, be necessarily to be received as their true sense, is, that it will not be very easily reconciled to your saying,^e you do not mean by the same body, the same individual particles which were united at the point of death. And yet by this interpretation of our Saviour's words, you can mean no other particles but such as were united at the point of death; because you mean no other substance but what comes out of the grave; and no substance, no particles come out, you say, but what were in the grave; and I think your lordship will not say, that the particles that were separate from the body by perspiration before the point of death, were laid up in the grave.

"But your lordship, I find, has an answer to this, viz.^f That by comparing this with other places, you find that the words (of our Saviour above quoted) are to be understood of the substance of the body, to which the soul was united, and not to (I suppose your lordship writ, of) these individual particles, i. e. those individual particles that are in the grave at the resurrection. For so they must be read, to make your lordship's sense entire, and to the purpose of your answer here; and then, methinks, this last sense of our Saviour's words given by your lordship, wholly overturns the sense which we have given of them above, where, from those words, you press the belief of the resurrection of the same body, by this strong argument, that a substance could not, upon hearing the voice of Christ, come out of the grave, which was never in the grave. There (as far as I can understand your words) your lordship argues, that our Saviour's words are to be understood of the particles in the grave, unless, as your lordship says, one can make out, that a substance which never was in the grave may come out of it. And here, your lordship expressly says, 'That our Saviour's words are to be understood of the substance of that body, to which the soul was (at any time) united, and not to those individual particles that are in the grave.' Which put together seems to me to say, That our Saviour's words are to be understood of those particles only which are in the grave, and not of those particles only which are in the grave, but of others also, which have at any time been vitally united to the soul, but never were in the grave.

"The next text your lordship brings to make the resurrection of the same body in your sense, an article of faith, are these words of St. Paul;^g 'For we must all appear before the judgment-seat of Christ, that every one may receive the things done in his body, according to that he hath done, whether it be good or bad.' To which your lordship subjoins^h this question: 'Can these words be understood of any other material substance, but that body in which these things were done?' Answer: A man may suspend his determining the mean-

^a Second answer.^b John, v. 28, 29.^c Second answer.^d Ibid.^e Ibid.^f Ibid.^g 2 Cor. v. 10.^h Second answer.

ing of the apostle to be, that a sinner shall suffer for his sins, in the very same body wherein he committed them; because St. Paul does not say he shall have the very same body when he suffers, that he had when he sinned. The apostle says, indeed, done in his body. The body he had, and did things in, at five or fifteen, was, no doubt, his body, as much as that which he did things in at fifty, was his body, though his body were not the very same body at those different ages; and so will the body, which he shall have after the resurrection, be his body, though it be not the very same with that which he had at five, or fifteen, or fifty. He that at threescore is broke on the wheel, for a murder he committed at twenty, is punished for what he did in his body, though the body he has, i. e. his body at threescore, be not the same, i. e. made up of the same individual particles of matter, that that body was which he had forty years before. When your lordship has resolved with yourself, what that same immutable he is which at the last judgment shall receive the things done in his body, your lordship will easily see, that the body he had when an embryo in the womb, when a child playing in coats, when a man marrying a wife, and when bed-rid dying of a consumption, and at last, which he shall have after his resurrection, are each of them his body, though neither of them be the same body, the one with the other.

“But farther, to your lordship’s question, ‘Can these words be understood of any other material substance, but that body in which these things were done?’ I answer, These words of St. Paul may be understood of another material substance than that body in which these things were done, because your lordship teaches me, and gives me a strong reason so to understand them. Your lordship says,^a ‘That you do not say the same particles of matter, which the sinner had at the very time of the commission of his sins, shall be raised at the last day.’ And your lordship gives this reason for it; ^b ‘For then a long sinner must have a vast body, considering the continued spending of particles by perspiration.’ Now, my lord, if the apostle’s words, as your lordship would argue, cannot be understood of any other material substance, but that body in which these things were done; and no body, upon the removal or change of some of the particles, that at any time made it up, is the same material substance, or the same body; it will, I think, thence follow, that either the sinner must have all the same individual particles vitally united to his soul when he is raised, that he had vitally united to his soul when he sinned; or else St. Paul’s words here, cannot be understood to mean the same body in which the things were done. For if there were other particles of matter in the body, wherein the things were done, than in that which is raised, that which is raised cannot be the same body in which they were done: unless that alone, which has just all the same individual particles when any action is done, being the same body wherein it was done, that also, which has not the same individual particles wherein that action was done, can be the same body wherein it was done; which is, in effect, to make the same body sometimes to be the same, and sometimes not the same.

“Your lordship thinks it suffices to make the same body to have not all, but no other particles of matter, but such as were some time or other, vitally united to the soul before: but such a body, made up of part of the particles some time or other vitally united to the soul, is no more the same body, wherein the actions were done, in the distant parts of the long sinner’s life, than that is the same body in which a quarter, or half, or three quarters of the same particles, that made it up, are wanting. For example, a sinner has acted here in his body a hundred years; he is raised at the last day, but with what body? The same, says your lordship, that he acted in; because St. Paul says, he must receive the things done in his body. What therefore, must his body at the resurrection consist of? Must it consist of all the particles of matter that have ever been vitally united to his soul? For they, in succession, have all of them made up his body, wherein he did these things: ‘No,’ says your lordship,^c ‘that would make his body too vast; it suffices to make the same body in which the things were done, that it consists of some of the particles, and no other, but such as were, some time, during his life, vitally united to his soul.’ But according to this account, his body at the resurrection being, as your lordship seems to limit it, near the same size it was in some part of his life, it will be no more the same body in which the things were done in the distant parts of his life, than that is the same body, in which half or three quarters, or more, of the individual matter that then made it up, is now wanting. For example, let his body at fifty years old, consist of a million of parts; five hundred thousand at least of those parts will be different from those which made up his body at ten years, and at a hundred. So that to take the numerical particles that made up his body at fifty, or any other season of his life, or to gather them promiscuously out of those which at different times have successively been vitally united to his soul, they will no more make the same body, which was his, wherein some of his actions were done, than that is the same body, which has but half the same particles: and yet all your lordship’s argument here for the same body, is, because St. Paul says, it must be his body in which these things were done; which it could not be if any other substance were joined to it, i. e. if any other particles of matter made up the body, which were not vitally united to the soul when the action was done.

“Again your lordship says,^d ‘That you do not say the same individual particles [shall

^a Second answer.

^b Ibid.

^c Ibid.

^d Ibid.

make up the body at the resurrection] which were united at the point of death, for there must be a great alteration in them in a lingering disease, as if a fat man falls into a consumption.^a Because, it is likely, your lordship thinks, these particles of a decrepit, wasted, withered body, would be too few, or unfit, to make such a plump, strong, vigorous, well-sized body, as it has pleased your lordship to proportion out in your thoughts to men at the resurrection; and, therefore, some small portion of the particles formerly united vitally to that man's soul, shall be reassumed to make up his body to the bulk your lordship judges convenient; but the greatest part of them shall be left out, to avoid the making his body more vast than your lordship thinks will be fit, as appears by these; your lordship's words immediately following, viz. ^a 'That you do not say the same particles the sinner had at the very time of commission of his sins; for then a long sinner must have a vast body.'

"But then, pray, my lord, what must an embryo do, who dying within a few hours after his body was vitally united to his soul, has no particles of matter, which were formerly vitally united to it, to make up his body of that size, and proportion, which your lordship seems to require in bodies at the resurrection? Or, must we believe he shall remain content with that small pittance of matter, and that yet imperfect body, to eternity, because it is an article of faith to believe the resurrection of the very same body, i. e. made up of only such particles as have been vitally united to the soul? For if it be so, as your lordship says,^b 'That life is the result of the union of soul and body,' it will follow, that the body of an embryo, dying in the womb, may be very little, not the thousandth part of any ordinary man. For since from the first conception and beginning of formation, it has life, and 'life is the result of the union of the soul with the body;' an embryo, that shall die either by the untimely death of the mother, or by any other accident, presently after it has life, must, according to your lordship's doctrine, remain a man, not an inch long, to eternity; because there are not particles of matter, formerly united to his soul, to make him bigger, and no other can be made use of to that purpose: though what greater congruity the soul hath with any particles of matter which were once vitally united to it, but are now so no longer, than it hath with particles of matter which it was never united to, would be hard to determine, if that should be demanded.

"By these, and not a few other the like, consequences, one may see what service they do to religion, and the Christian doctrine, who raise questions, and make articles of faith, about the resurrection of the same body, where the scripture says nothing of the same body; or if it does, it is with no small reprimand^c to those who make such an inquiry. 'But some man will say, How are the dead raised up? and with what body do they come? Thou fool, that which thou sowest, is not quickened, except it die. And that which thou sowest, thou sowest not that body that shall be, but bare grain, it may chance of wheat, or some other grain. But God giveth it a body, as it hath pleased him. Words, I should think, sufficient to deter us from determining any thing for or against the same body's being raised at the last day. It suffices, that all the dead shall be raised, and every one appear and answer for the things done in his life, and receive according to the things he has done in his body, whether good or bad. He that believes this, and has said nothing inconsistent herewith, I presume may, and must, be acquitted from being guilty of any thing inconsistent with the article of the resurrection of the dead.

"But your lordship, to prove the resurrection of the same body to be an article of faith, farther asks,^d 'How could it be said, if any other substance be joined to the soul at the resurrection, as its body, that they were the things done in or by the body?' Answer. Just as it may be said of a man at a hundred years old, that hath then another substance joined to his soul, than he had at twenty; that the murder or drunkenness, he was guilty of at twenty, were things done in the body; how 'by the body,' comes in here I do not see.

"Your lordship adds: 'And St. Paul's dispute about the manner of raising the body, night soon have ended, if there were no necessity of the same body.' Answer. When I understand what argument there is in these words to prove the resurrection of the same body, without the mixture of one new atom of matter, I shall know what to say to it. In the mean time, this I understand, that St. Paul would have put as short an end to all disputes about this matter, if he had said, that there was a necessity of the same body, or that it should be the same body.

"The next text of scripture you bring for the same body, is,^e 'If there be no resurrection of the dead, then is not Christ raised.' From which your lordship argues,^f 'It seems then, their bodies are to be raised as his was.' I grant other dead, as certainly raised as Christ was; for else his resurrection would be of no use to mankind. But I do not see how it follows, that they shall be raised with the same body, as Christ was raised with the same body, as your lordship infers, in these words annexed: 'And can there be any doubt, whether his body was the same material substance which was united to his soul before?' I answer, none at all; nor that it had just the same distinguishing lineaments and marks, yea, and

^a Second answer.^b Ibid.^c 1 Cor. xv. 35, &c.^d Second answer.^e 1 Cor. xv. 16.^f Second answer.

the same wounds, that it had at the time of his death. If, therefore, your lordship will argue from other bodies being raised as his was, That they must keep proportion with his in sameness; then we must believe, that every man shall be raised with the same lineaments and other notes of distinction he had at the time of his death, even with his wounds yet open, if he had any, because our Saviour was so raised; which seems to me scarce reconcilable with what your lordship says,^a of a fat man falling into a consumption, and dying.

“But whether it will consist or no with your lordship’s meaning in that place, this to me seems a consequence that will need to be better proved, viz. That our bodies must be raised the same, just as our Saviour’s was: because St. Paul says, ‘If there be no resurrection of the dead, then is not Christ risen.’ For it may be a good consequence, Christ is risen, and, therefore, there shall be a resurrection of the dead; and yet this may not be a good consequence, Christ was raised with the same body he had at his death, therefore all men shall be raised with the same body they had at their death, contrary to what your lordship says concerning a fat man dying of a consumption. But the case I think far different betwixt our Saviour, and those to be raised at the last day.

“1. His body saw not corruption, and, therefore, to give him another body, new moulded, mixed with other particles, which were not contained in it, as it lay in the grave, whole and entire as it was laid there, had been to destroy his body to frame him a new one, without any need. But why, with the remaining particles of a man’s body, long since dissolved and mouldered into dust and atoms (whereof, possibly, a great part may have undergone variety of changes, and entered into other concretions; even in the bodies of other men), other new particles of matter mixed with them, may not serve to make his body again, as well as the mixture of new and different particles of matter with the old, did in the compass of his life make his body, I think no reason can be given.

“This may serve to shew, why, though the materials of our Saviour’s body were not changed at his resurrection; yet it does not follow, but that the body of a man dead and rotten in his grave, or burnt, may at the last day have several new particles in it, and that without any inconvenience: since whatever matter is vitally united to his soul, is his body, as much as is that which was united to it when he was born, or in any other part of his life.

“2. In the next place, the size, shape, figure, and lineaments of our Saviour’s body, even to his wounds, into which doubting Thomas put his fingers and his hand, were to be kept in the raised body of our Saviour, the same they were at his death, to be a conviction to his disciples, to whom he shewed himself, and who were to be witnesses of his resurrection, that their master, the very same man, was crucified, dead, and buried, and raised again; and, therefore, he was handled by them, and eat before them, after he was risen, to give them in all points full satisfaction that it was really he, the same, and not another, nor a spectre or apparition of him; though I do not think your lordship will thence argue, that because others are to be raised as he was, therefore, it is necessary to believe, that because he eat after his resurrection, others, at the last day, shall eat and drink after they are raised from the dead; which seems to me as good an argument, as because his undissolved body was raised out of the grave, just as it there lay entire, without the mixture of any new particles; therefore the corrupted and consumed bodies of the dead, at the resurrection, shall be new framed only out of those scattered particles which were once vitally united to their souls, without the least mixture of any one single atom of new matter. But at the last day, when all men are raised, there will be no need to be assured of any one particular man’s resurrection. It is enough that every one shall appear before the judgment-seat of Christ, to receive according to what he had done in his former life; but in what sort of body he shall appear, or of what particles made up, the scripture having said nothing, but that it shall be a spiritual body raised in incorruption, it is not for me to determine.

“Your lordship asks,^b ‘Were they (who saw our Saviour after his resurrection) witnesses only of some material substance then united to his soul?’ In answer, I beg your lordship to consider, whether you suppose our Saviour was to be known to be the same man (to the witnesses that were to see him, and testify his resurrection) by his soul, that could neither be seen or known to be the same: or by his body, that could be seen, and by the discernible structure and marks of it, be known to be the same? When your lordship has resolved that, all that you say in that page will answer itself. But because one man cannot know another to be the same, but by the outward visible lineaments, and sensible marks, he has been wont to be known and distinguished by, will your lordship, therefore, argue, that the Great Judge, at the last day, who gives to each man, whom he raises, his new body, shall not be able to know who is who, unless he give to every one of them a body, just of the same figure, size, and features, and made up of the very same individual particles he had in his former life? Whether such a way of arguing for the resurrection of the same body, to be an article of faith, contributes much to the strenghtening of the credibility of the article of resurrection of the dead, I shall leave to the judgment of others.

“Farther, for the proving the resurrection of the same body, to be an article of faith, your

^a Second answer.

^b Ibid.

lordship says,^a 'But the apostle insists upon the resurrection of Christ, not merely as an argument of the possibility of ours, but of the certainty of it;^b because he rose as the first-fruits; Christ the first-fruits, afterward they that are Christ's at his coming.' Answer. No doubt, the resurrection of Christ is a proof of the certainty of our resurrection. But is it, therefore, a proof of the resurrection of the same body, consisting of the same individual particles which concurred to the making up of the body here, without the mixture of any one other particle of matter? I confess I see no such consequence.

'But your lordship goes on:^c 'St. Paul was aware of the objections in men's minds about the resurrection of the same body; and it is of great consequence as to this article, to shew upon what grounds he proceeds: 'But some men will say, how are the dead raised up, and with what body do they come?' First, he shews, that the seminal parts of plants are wonderfully improved by the ordinary Providence of God, in the manner of their vegetation.' Answer. I do not perfectly understand, what it is 'for the seminal parts of plants to be wonderfully improved by the ordinary Providence of God, in the manner of their vegetation:' or else, perhaps, I should better see how this here tends to the proof of the resurrection of the same body, in your lordship's sense.

'It continues,^d 'They sow bare grain of wheat, or of some other grain, but God giveth it a body, as it hath pleased him, and to every seed his own body. Here,' says your lordship, 'is an identity of the material substance supposed.' It may be so. But to me, a diversity of the material substance, i. e. of the component particles, is here supposed, or in direct words said. For the words of St. Paul taken altogether, run thus:^e 'That which thou sowest, thou sowest not that body that shall be, but bare grain:' and so on, as your lordship has set down in the remainder of them. From which words of St. Paul, the natural argument seems to me to stand thus: If the body that is put in the earth in sowing, is not that body which shall be, then the body that is put in the grave, is not that, i. e. the same body, that shall be.

'But your lordship proves it to be the same body, by these three Greek words of the text, τὸ ἴδιον σῶμα, which your lordship interprets thus,^f 'That proper body which belongs to it.' Answer. Indeed by those Greek words, τὸ ἴδιον σῶμα, whether our translators have rightly rendered them 'his own body,' or your lordship more rightly, 'that proper body which belongs to it,' I formerly understood no more but this, that in the production of wheat, and other grain from seed, God continued every species distinct; so that from grains of wheat sown, root, stalk, blade, ear, grains of wheat, were produced, and not those of barley; and so of the rest, which I took to be the meaning of, to every seed his own body.' 'No,' says your lordship, 'these words prove, that to every plant of wheat, and to every grain of wheat produced in it, is given the proper body that belongs to it, which is the same body with the grain that was sown.' Answer. This, I confess, I do not understand; because I do not understand how one individual grain, can be the same with twenty, fifty, or a hundred individual grains; for such sometimes is the increase.

'But your lordship proves it. 'For,' says your lordship,^g 'every seed having that body in little, which is afterwards so much enlarged; and in grain, the seed is corrupted before the germination; but it hath its proper organical parts, which make it the same body with that which it grows up to. For although grain be not divided into lobes, as other seeds are, yet it hath been found, by the most accurate observations, that upon separating the membranes, these seminal parts are discerned in them; which afterwards grow up to that body which we call corn. In which words I crave leave to observe, that your lordship supposes that a body may be enlarged by the addition of a hundred or a thousand times as much in bulk as its own matter, and yet continue the same body; which, I confess, I cannot understand.

'But in the next place, if that could be so; and that the plant, in its full growth at harvest, increased by a thousand or a million of times as much new matter added to it, as it had when it lay a little concealed in the grain that was sown, was the very same body; yet I do not think that your lordship will say, that every minute, insensible, and inconceivably small grain of the hundred grains, contained in that little organized seminal plant, is every one of them the very same with that grain which contains that whole seminal plant, and all those invisible grains in it. For then it will follow, that one grain is the same with a hundred, and a hundred distinct grains the same with one: which I shall be able to assent to, when I can conceive, that all the wheat in the world is but one grain.

'For I beseech you, my lord, consider what it is St. Paul here speaks of: it is plain he speaks of that which is sown and dies, i. e. the grain that the husbandman takes out of his barn to sow in his field. And of this grain St. Paul says, 'that it is not that body that shall be.' These two, viz. 'that which is sown, and that body that shall be,' are all the bodies that St. Paul here speaks of, to represent the agreement or difference of men's bodies after the resurrection, with those they had before they died. Now, I crave leave to ask your lordship, which of these two is that little invisible seminal plant which your lordship here

^a Second answer.^b 1 Cor. xv. 20. 23.^c Second answer.^d Ibid.^e V. 37.^f Second answer.^g Ibid.

speaks of? Does your lordship mean by it the grain that is sown? But that is not what St. Paul speaks of; he could not mean this embryonated little plant, for he could not denote it by these words, 'that which thou sowest,' for that he says must die: but this little embryonated plant, contained in the seed that is sown, dies not: or does your lordship mean by it, 'the body that shall be?' But neither by these words, 'the body that shall be,' can St. Paul be supposed to denote this insensible little embryonated plant; for that is already in being, contained in the seed that is sown, and, therefore, could not be spoken of under the name of 'the body that shall be.' And, therefore, I confess, I cannot see of what use it is to your lordship, to introduce here this third body which St. Paul mentions not, and to make that the same, or not the same, with any other, when those which St. Paul speaks of, are, as I humbly conceive, these two visible sensible bodies, the grain sown, and the corn grown up to ear; with neither of which, this insensible embryonated plant can be the same body, unless an insensible body can be the same body with a sensible body, and a little body can be the same body with one ten thousand, or a hundred thousand, times as big as itself. So that yet, I confess, I see not the resurrection of the same body proved, from these words of St. Paul, to be an article of faith.

"Your lordship goes on:^a 'St. Paul indeed saith, That' we sow not that body that shall be; but he speaks not of the identity, but the perfection of it.' Here my understanding fails me again: for I cannot understand St. Paul to say, That the same identical sensible grain of wheat, which was sown at seed-time, is the very same with every grain of wheat in the ear at harvest, that sprang from it: yet so I must understand it, to make it prove, that the same sensible body that is laid in the grave, shall be the very same with that which shall be raised at the resurrection. For I do not know of any seminal body in little, contained in the dead carcass of any man or woman, which, as your lordship says, in seeds, having its proper organical parts, shall afterwards be enlarged, and at the resurrection grow up into the same man. For I never thought of any seed or seminal parts, either of plant or animal, 'so wonderfully improved by the Providence of God,' whereby the same plant or animal should beget itself; nor ever heard, that it was by Divine Providence designed to produce the same individual, but for the producing of future and distinct individuals, for the continuation of the same species.

"Your lordship's next words are,^b 'And although there be such a difference from the grain itself, when it comes up to the perfect corn, with root, stalk, blade, and ear, that it may be said to outward appearance not to be the same body; yet with regard to the seminal and organical parts, it is as much the same, as a man grown up is the same with the embryo in the womb.' Answer. It does not appear, by any thing I can find in the text, that St. Paul here compared the body produced, with the seminal and organical parts contained in the grain it sprang from, but with the whole sensible grain that was grown. Microscopes had not then discovered the little embryo plant in the seed: and supposing it should have been revealed to St. Paul (though in the scripture we find little revelation of natural philosophy), yet an argument taken from a thing perfectly unknown to the Corinthians, whom he writ to, could be of no manner of use to them; nor serve at all either to instruct or convince them. But granting that those St. Paul writ to, knew it as well as Mr. Lewenhoek; yet your lordship, thereby, proves not the raising of the same body: your lordship says, 'It is as much the same' (I crave leave to add body) 'as a man grown up is the same' (same what, I beseech your lordship?) 'with the embryo in the womb.' For that the body of the embryo in the womb, and body of the man grown up, is the same body, I think no one will say; unless he can persuade himself that a body that is not the hundredth part of another, is the same with that other; which I think no one will do, till having renounced this dangerous way by ideas of thinking and reasoning, he has learnt to say, that a part and the whole are the same.

"Your lordship goes on:^c 'And although many arguments may be used to prove, that a man is not the same, because life, which depends upon the course of the blood, and the manner of respiration, and nutrition, is so different in both states; yet that man would be thought ridiculous, that should seriously affirm, that it was not the same man.' And your lordship says, 'I grant, that the variation of great parcels of matter in plants, alters not the identity: and that the organization of the parts in one coherent body, partaking of one common life, makes the identity of a plant.' Answer. My lord, I think the question is not about the same man, but the same body. For though I do say,^d (somewhat differently from what your lordship sets down as my words here), 'That that which has such an organization, as is fit to receive and distribute nourishment, so as to continue and frame the wood, bark, and leaves, &c. of a plant, in which consists the vegetable life, continues to be the same plant, as long as it partakes of the same life, though that life be communicated to new particles of matter, vitally united to the living plant:' yet I do not remember, that I any where say, That a plant, which was once no bigger than an oaten straw, and, afterwards, grows to be above a fathom about, is the same body, though it be still the same plant.

"The well-known tree in Epping Forest, called the King's Oak, which, from not weighing

^a Second answer.

^b Ibid.

^c Ibid.

^d Essay, b. 2. c. 27. § 4.

an ounce at first, grew to have many tons of timber in it, was all along the same oak, the very same plant; but nobody, I think, will say that it was the same body, when it weighed a ton, as it was when it weighed but an ounce; unless he has a mind to signalize himself, by saying, That that is the same body, which has a thousand different particles of matter in it, for one particle that is the same; which is no better than to say, That a thousand different particles are but one and the same particle, and one and the same particle is a thousand different particles; a thousand times a greater absurdity, than to say half is the whole, or the whole is the same with the half; which will be improved ten thousand times yet farther, if a man shall say (as your lordship seems to me to argue here), that that great oak is the very same body with the acorn it sprang from, because there was in that acorn an oak in little, which was afterwards (as your lordship expresses it) so much enlarged, as to make that mighty tree. For this embryo, if I may so call it, or oak in little, being not the hundredth, or, perhaps, the thousandth, part of the acorn, and the acorn being not the thousandth part of the grown oak, it will be very extraordinary to prove the acorn and the grown oak to be the same body, by a way wherein it cannot be pretended that above one particle of a hundred thousand, or a million, is the same in the one body, that it was in the other. From which way of reasoning, it will follow, that a nurse and her sucking child have the same body; and be past doubt, that a mother and her infant have the same body. But this is a way of certainty, found out to establish the articles of faith, and to overturn the new method of certainty, that your lordship says I have started, which is apt to leave men's minds more doubtful than before.

“And now I desire your lordship to consider of what use it is to you, in the present case, to quote out of my Essay, these words: ‘That partaking of one common life, makes the identity of a plant;’ since the question is not about the identity of a plant, but about the identity of a body. It being a very different thing, to be the same plant, and to be the same body. For that which makes the same plant, does not make the same body; the one being the partaking in the same continued vegetable life; the other, the consisting of the same numerical particles of matter. And, therefore, your lordship’s inference from my words above quoted, in these which you subjoin,^a seems to me a very strange one, viz. ‘So that in things capable of any sort of life; the identity is consistent with a continued succession of parts; and so the wheat grown up, is the same body with the grain that was sown.’ For I believe, if my words, from which you infer, ‘and so the wheat grown up, is the same body with the grain that was sown,’ were put into a syllogism, this would hardly be brought to be the conclusion.

“But your lordship goes on with consequence upon consequence, though I have not eyes acute enough, every where to see the connexion, till you bring it to the resurrection of the same body. The connexion of your lordship’s words^b is as followeth: ‘And thus the alteration of the parts of the body at the resurrection, is consistent with its identity, if its organization and life be the same; and this is a real identity of the body, which depends not upon consciousness. From whence it follows, that to make the same body, no more is required, but restoring life to the organized parts of it.’ If the question were about raising the same plant, I do not say but there might be some appearance for making such an inference from my words as this, ‘Whence it follows, that to make the same plant, no more is required, but to restore life to the organized parts of it.’ But this deduction, wherein from those words of mine, that speak only of the identity of a plant, your lordship infers, there is no more required to make the same body, than to make the same plant, being too subtle for me, I leave to my reader to find out.

“Your lordship goes on, and says,^c ‘That I grant likewise, that the identity of the same man, consists in a participation of the same continued life, by constantly fleeting particles of matter in succession, vitally united to the same organized body.’ Answer. I speak in these words of the identity of the same man, and your lordship thence roundly concludes; ‘so that there is no difficulty of the sameness of the body.’ But your lordship knows, that I do not take these two sounds, man and body, to stand for the same thing; nor the identity of the man to be the same with the identity of the body.

“But let us read out your lordship’s words.^d ‘So that there is no difficulty as to the sameness of the body, if life were continued; and if, by Divine Power, life be restored to that material substance, which was before united by a re-union of the soul to it, there is no reason to deny the identity of the body, not from the consciousness of the soul, but from that life which is the result of the union of the soul and body.’

“If I understand your lordship right, you, in these words, from the passages above quoted out of my book, argue, that from those words of mine it will follow, That it is or may be the same body, that is raised at the resurrection. If so, my lord, your lordship has then proved, That my book is not inconsistent with, but conformable to, this article of the resurrection of the same body, which your lordship contends for, and will have to be an article of faith: for though I do by no means deny, that the same bodies shall be raised at the last day, yet I see nothing your lordship has said to prove it to be an article of faith.

^a Second answer.^b Ibid.^c Ibid.^d Ibid.

“ But your lordship goes on with your proofs, and says,^a ‘ But St. Paul still supposes, that it must be that material substance to which the soul was before united. ‘ For,’ saith he, ‘ it is sown in corruption, it is raised in incorruption: it is sown in dishonour, it is raised in glory: it is sown in weakness, it is raised in power: it is sown a natural body, it is raised a spiritual body.’ Can such a material substance, which was never united to the body, be said to be sown in corruption, and weakness, and dishonour? either, therefore, he must speak of the body, or his meaning cannot be comprehended.’ I answer, Can such a material substance, which was never laid in the grave, be said to be sown? &c. For your lordship says,^b ‘ You do not say the same individual particles, which were united at the point of death, shall be raised at the last day; and no other particles are laid in the grave, but such as are united at the point of death; either, therefore, your lordship must speak of another body, different from that which was sown, which shall be raised, or else your meaning, I think, cannot be comprehended.

“ But whatever be your meaning, your lordship proves it to be St. Paul’s meaning, that the same body shall be raised, which was sown, in these following words: ‘ For what does all this relate to a conscious principle?’ Answer. The scripture being express, That the same person should be raised and appear before the judgment-seat of Christ, that every one may receive according to what he had done in his body; it was very well suited to common apprehensions (which refined not about ‘ particles that had been vitally united to the soul’), to speak of the body, which each one was to have after the resurrection, as he would be apt to speak of it himself. For it being his body both before and after the resurrection, every one ordinarily speaks of his body as the same, though, in a strict and philosophical sense, as your lordship speaks, it be not the very same. Thus it is no impropriety of speech to say, This body of mine, which was formerly strong and plump, is now weak and wasted, though, in such a sense as you are speaking here, it be not the same body. Revelation declares nothing any where concerning the same body, in your lordship’s sense of the same body, which appears not to have been thought of. The apostle directly proposes nothing for or against the same body (as necessary to be believed); that which he is plain and direct in, is opposing and condemning such curious questions about the body, which could serve only to perplex, not to confirm, what was material and necessary for them to believe, viz. a day of judgment and retribution to men in a future state; and therefore, it is no wonder that mentioning their bodies, he should use a way of speaking suited to vulgar notions, from which it would be hard positively to conclude any thing for the determining of this question (especially against expressions in the same discourse that plainly incline to the other side) in a matter which, as it appears, the apostle thought not necessary to determine; and the Spirit of God thought not fit to gratify any one’s curiosity in.

“ But your lordship says,^d ‘ The apostle speaks plainly of that body which was once quickened, and afterwards falls to corruption, and is to be restored with more noble qualities.’ I wish your lordship had quoted the words of St. Paul, wherein he speaks plainly of that numerical body that was once quickened, they would presently decide this question. But your lordship proves it, by these following words of St. Paul. ‘ For this corruption must put on incorruption, and this mortal must put on immortality;’ to which your lordship adds, that ‘ you do not see how he could more expressly affirm the identity of this corruptible body, with that after the resurrection.’ How expressly it is affirmed by the apostle, shall be considered by and by. In the mean time, it is past doubt that your lordship best knows what you do, or do not see. But this I would be bold to say, that if St. Paul had, any where in this chapter (where there are so many occasions for it, if it had been necessary to have been believed), but said in express words, that the same bodies should be raised, every one else, who thinks of it, will see he had more expressly affirmed the identity of the bodies which men now have, with those they shall have after the resurrection.

“ The remainder of your lordship’s period^e is; ‘ And that without any respect to the principle of self-consciousness.’ Answer. These words, I doubt not, have some meaning, but I must own, I know not what; either towards the proof of the resurrection of the same body, or to shew, that any thing I have said concerning self-consciousness, is inconsistent; for I do not remember that I have any where said, that the identity of body consisted in self-consciousness.

“ From your preceding words, your lordship concludes thus;^f ‘ And so if the scripture be the sole foundation of our faith, this is an article of it.’ My lord, to make the conclusion unquestionable, I humbly conceive the words must run thus. And so if the scripture, and your lordship’s interpretation of it, be the sole foundation of our faith, the resurrection of the same body is an article of it. For with submission, your lordship has neither produced express words of scripture for it, nor so proved that to be the meaning of any of those words of scripture, which you have produced for it, that a man who reads, and sincerely endeavours to understand, the scripture, cannot but find himself obliged to believe, as expressly, that the same bodies of the dead, in your lordship’s sense, shall be raised, as that the dead shall be raised. And I crave leave to give your lordship this one reason for it. He who

^a Second answer.^b Ibid.^c Ibid.^d Ibid.^e Ibid.^f Ibid.

reads with attention this discourse of St. Paul,^a where he discourses of the resurrection, will see, that he plainly distinguishes between the dead that shall be raised, and the bodies of the dead. For it is νεκροί, πάντες, οἱ, are the nominative cases to βεγίρονται, ζωοποιθήσονται, ἐγερθήσονται, all along, and not σώματα, bodies; which one may with reason think would somewhere or other have been expressed, if all this had been said to propose it as an article of faith, that the very same bodies should be raised. The same manner of speaking the Spirit of God observes all through the New Testament, where it is said,^c raise the dead, quicken or make alive the dead, the resurrection of the dead. Nay, these very words of our Saviour,^d urged by your lordship, for the resurrection of the same body, run thus: Πάντες οἱ ἐν τοῖς μνημείοις ἀκούσονται τῆς φωνῆς αὐτοῦ καὶ ἐκπορεύσονται, οἱ τὰ ἀγαθὰ ποιήσαντες εἰς ἀνάστασιν ζωῆς οἱ δὲ τὰ φαῦλα πράξαντες εἰς ἀνάστασιν κρίσεως. Would not a well meaning searcher of the scriptures be apt to think, that if the thing here intended by our Saviour, were to teach and propose it as an article of faith, necessary to be believed by every one, that the very same bodies of the dead should be raised; would not, I say, any one be apt to think, that if our Saviour meant so, the words should rather have been, πάντα τὰ σώματα, ἀ ἐν τοῖς μνημείοις i. e. all the bodies that are in the graves, rather than all who are in the graves; which must denote persons, and not precisely bodies.

“Another evidence that St. Paul makes a distinction between the dead, and the bodies of the dead, so that the dead cannot be taken in this, 1 Cor. xv. to stand precisely for the bodies of the dead, are these words of the apostle,^e ‘But some man will say, how are the dead raised? and with what body do they come?’ Which words, dead and they, if supposed to stand precisely for the bodies of the dead, the question will run thus: How are the dead bodies raised? and with what bodies do the dead bodies come? which seems to have no very agreeable sense.

“This, therefore, being so, that the Spirit of God keeps so expressly to this phrase, or form of speaking, in the New Testament, ‘of raising, quickening, rising, resurrection, &c., of the dead,’ where the resurrection at the last day is spoken of; and that the body is not mentioned, but in answer to this question, ‘With what bodies shall those dead, who are raised, come?’ so that by the dead cannot precisely be meant the dead bodies; I do not see but a good Christian, who reads the scripture, with an intention to believe all that is there revealed to him, concerning the resurrection, may acquit himself of his duty therein, without entering into the inquiry, whether the dead shall have the very same bodies or no? which sort of inquiry, the apostle, by the appellation he bestows here on him that makes it, seems not much to encourage. Nor, if he shall think himself bound to determine concerning the identity of the bodies of the dead, raised at the last day; will he, by the remainder of St. Paul’s answer, find the determination of the apostle to be much in favour of the very same body, unless the being told, that the body sown is not that body that shall be; that the body raised is as different from that which was laid down, as the flesh of man is from the flesh of beasts, fishes, and birds; or as the sun, moon, and stars, are different one from another; or as different as a corruptible, weak, natural, mortal body, is from an incorruptible, powerful, spiritual, immortal body; and, lastly, as different as a body that is flesh and blood, is from a body that is not flesh and blood. ‘For flesh and blood cannot,’ says St. Paul, in this very place,^f ‘inherit the kingdom of God,’ unless, I say, all this, which is contained in St. Paul’s words, can be supposed to be the way to deliver this as an article of faith, which is required to be believed by every one, viz. That the dead should be raised with the very same bodies that they had before in this life; which article proposed in these or the like plain and express words, could have left no room for doubt in the meanest capacities; nor for contest in the most perverse minds.

“Your lordship adds, in the next words,^g ‘And so it hath been always understood by the Christian church, viz. That the resurrection of the same body, in your lordship’s sense of the same body, is an article of faith.’ Answer. What the Christian has always understood, is beyond my knowledge. But for those who coming short of your lordship’s great learning, cannot gather their articles of faith from the understanding of all the whole Christian church, ever since the preaching of the Gospel (who make the far greater part of Christians, I think I may say nine hundred and ninety and nine of a thousand), but are forced to have recourse to the scripture, to find them there, I do not see that they will easily find there this proposed as an article of faith, that there shall be a resurrection of the same body; but that there shall be a resurrection of the dead, without explicitly determining, That they shall be raised with bodies made up wholly of the same particles which were once vitally united to their souls, in their former life, without the mixture of any one other particle of matter; which is that which your lordship means by the same body.

“But supposing your lordship to have demonstrated this to be an article of faith, though

^g Second answer.

I crave leave to own, that I do not see that all your lordship has said here, makes it so much as probable; What is all this to me? 'Yes,' says your lordship in the following words,^a 'my idea of personal identity is inconsistent with it, for it makes the same body which was here united to the soul, not to be necessary to the doctrine of the resurrection. But any material substance united to the same principle of consciousness, makes the same body.'

"This is an argument of your lordship's, which I am obliged to answer to. But is it not fit I should first understand it, before I answer it? Now, here, I do not well know, what it is to make a thing not to be necessary to the doctrine of the resurrection. But to help myself out the best I can, with a guess, I will conjecture (which in disputing with learned men, is not very safe) your lordship's meaning is, That 'my idea of personal identity makes it not necessary,' that for the raising the same person, the body should be the same.

"Your lordship's next word is 'but:' to which I am ready to reply, but what? what does my idea of personal identity do? for something of that kind, the adversative particle 'but' should, in the ordinary construction of our language, introduce to make the proposition clear and intelligible: but here is no such thing. 'But,' is one of your lordship's privileged particles, which I must not meddle with; for fear your lordship complain of me again, 'as so severe a critic, that for the least ambiguity in any particle, fill up pages in my answer, to make my book look considerable for the bulk of it.' But since this proposition here, 'my idea of a personal identity, makes the same body which was here united to the soul, not necessary to the doctrine of the resurrection: but any material substance being united to the same principle of consciousness, makes the same body,' is brought to prove my idea of personal identity inconsistent with the article of the resurrection; I must make it out in some direct sense or other, that I may see whether it be both true and conclusive. I, therefore, venture to read it thus: 'my idea of personal identity makes the same body which was here united to the soul, not to be necessary at the resurrection, but allows, that any material substance being united to the same principle of consciousness, makes the same body. Ergo, my idea of personal identity is inconsistent with the article of the resurrection of the same body.'

"If this be your lordship's sense in this passage, as I here have guessed it to be, or else I know not what it is, I answer,

"1. That my idea of personal identity does not allow, that any material substance, being united to the same principle of consciousness, makes the same body. I say no such thing in my book, nor any thing from whence it may be inferred; and your lordship would have done me a favour to have set down the words where I say so, or those from which you infer so, and shewed how it follows from any thing I have said.

"2. Granting, that it were a consequence from my idea of personal identity, that 'any material substance being united to the same principle of consciousness, makes the same body;' this would not prove that my idea of personal identity was inconsistent with this proposition, 'that the same body shall be raised;' but, on the contrary, affirms it: since, if I affirm, as I do, that the same persons shall be raised, and it be a consequence of my idea of personal identity, that 'any material substance being united to the same principle of consciousness, makes the same body;' it follows, that if the same person be raised, the same body must be raised; and so I have herein not only said nothing inconsistent with the resurrection of the same body, but have said more for it than your lordship. For there can be nothing plainer, than that in the scripture it is revealed, that the same persons shall be raised, and appear before the judgment-seat of Christ, to answer for what they have done in their bodies. If, therefore, whatever matter be joined to the same principle of consciousness makes the same body, it is demonstration, that if the same persons are raised, they have the same bodies.

"How then your lordship makes this an inconsistency with the resurrection is beyond my conception. 'Yes,' says your lordship,^b 'it is inconsistent with it, for it makes the same body, which was here united to the soul, not to be necessary.'

"3. I answer, therefore, *Thirdly*, That this is the first time I ever learnt, that 'not necessary,' was the same with 'inconsistent.' I say, that a body made up of the same numerical parts of matter, is not necessary to the making of the same person; from whence it will indeed follow, that to the resurrection of the same person, the same numerical particles of matter are not required. What does your lordship infer from hence? to wit, this: therefore, he who thinks that the same particles of matter are not necessary to the making of the same person, cannot believe that the same persons shall be raised with bodies made of the very same particles of matter, if God should reveal, that it shall be so, viz. that the same persons shall be raised with the same bodies they had before. Which is all one as to say, that he who thought the blowing of rams' horns was not necessary in itself to the falling down of the walls of Jericho, could not believe that they should fall upon the blowing of rams' horns, when God had declared it should be so.

"Your lordship says, 'my idea of personal identity is inconsistent with the article of the resurrection;' the reason you ground it on, is this, because it makes not the same body neces-

^a Second answer.

^b Ibid.

sary to the making the same person. Let us grant your lordship's consequence to be good, what will follow from it? No less than this, that your lordship's notion (for I dare not say your lordship has any so dangerous things as ideas) of personal identity, is inconsistent with the article of the resurrection. The demonstration of it is thus; your lordship says,^a 'It is not necessary that the body to be raised at the last day, should consist of the same particles of matter which were united at the point of death; for there must be a great alteration in them in a lingering disease; as if a fat man falls into a consumption; you do not say the same particles which the sinner had at the very time of commission of his sins; for then a long sinner must have a vast body, considering the continual spending of particles by perspiration.' And again, here your lordship says,^b 'you allow the notion of personal identity to belong to the same man, under several changes of matter. From which words it is evident, that your lordship supposes a person in this world may be continued and preserved the same in a body not consisting of the same individual particles of matter; and hence, it demonstratively follows, that let your lordship's notion of personal identity be what it will, it makes 'the same body not to be necessary to the same person;' and, therefore, it is by your lordship's rule, inconsistent with the article of the resurrection. When your lordship shall think fit to clear your own notion of personal identity from this inconsistency with the article of the resurrection, I do not doubt but my idea of personal identity will be thereby cleared too. Till then, all inconsistency with that article, which your lordship has here charged on mine, will, unavoidably, fall upon your lordship's too.

"But for the clearing of both, give me leave to say, my lord, that whatsoever is not necessary, does not, thereby, become inconsistent. It is not necessary to the same person, that his body should always consist of the same numerical particles; this is demonstration, because the particles of the bodies of the same persons, in this life, change every moment, and your lordship cannot deny it; and yet this makes it not inconsistent with God's preserving, if he thinks fit, to the same persons, bodies consisting of the same numerical particles always, from the resurrection to eternity. And so, likewise, though I say any thing that supposes it not necessary that the same numerical particles, which were vitally united to the soul in this life, should be re-united to it at the resurrection, and constitute the body it shall then have; yet it is not inconsistent with this, that God may, if he pleases, give to every one a body consisting only of such particles as were before vitally united to his soul. And thus, I think, I have cleared my book from all that inconsistency which your lordship charges on it, and would persuade the world it has, with the article of the resurrection of the dead.

"Only before I leave it, I will set down the remainder of what your lordship says upon his head, that though I see not the coherence nor tendency of it, nor the force of any argument in it against me; yet that nothing may be omitted that your lordship has thought fit to entertain your reader with, on this new point, nor any one have reason to suspect, that I have passed by any word of your lordship's (on this now introduced subject) wherein he might find your lordship had proved what you had promised in your title page. Your remaining words are these:^c 'The dispute is not how far personal identity in itself may consist in the very same material substance; for we allow the notion of personal identity to belong to the same man under several changes of matter; but whether it doth not depend upon a vital union between the soul, and body, and the life, which is consequent upon it; and, therefore, in the resurrection, the same material substance must be re-united, or else it cannot be called a resurrection, but a renovation, i. e. it may be a new life, but not a raising the body from the dead.' I confess, I do not see how what is here ushered in by the words, 'and, therefore,' is a consequence from the preceding words; but as to the propriety of the name, I think it will not be much questioned, that if the same man rise who was dead, it may very properly be called the resurrection of the dead; which is the language of the scripture.

"I must not part with this article of the resurrection, without returning my thanks to your lordship for making me^d take notice of a fault in my Essay. When I wrote that book, I took it for granted, as I doubt not but many others have done, that the scripture had mentioned, in express terms, 'the resurrection of the body.' But upon the occasion your lordship has given me in your last letter, to look a little more narrowly into what revelation has declared concerning the resurrection, and finding no such express words in the scripture, as that 'the body shall rise, or be raised, or the resurrection of the body;' I shall, in the next edition of it, change these words of my book,^e 'The dead bodies of men shall rise,' into these of the scripture, 'the dead shall rise.' Not that I question, that the dead shall be raised with bodies; but in matters of revelation I think it not only safest, but our duty, as for as any one delivers it for revelation, to keep close to the words of the scripture, unless he will assume to himself the authority of one inspired, or make himself wiser than the Holy spirit himself. If I had spoke of the resurrection in precisely scripture terms, I had avoided giving your lordship the occasion of making^f here such verbal reflection on my words; 'What! but if there be an idea of identity as to the body?'"

^a Second answer.^b Ibid.^c Ibid.^d Ibid.^e Essay, b. 4. c. 18. § 7.^f Second answer.

CHAP. XXVIII.

OF OTHER RELATIONS.

§ 1. *Proportional*.—Besides the before-mentioned occasions of time, place, and causality of comparing, or referring things one to another, there are, as I have said, infinite others, some whereof I shall mention.

First, The first I shall name, is some one simple idea; which being capable of parts or degrees, affords an occasion of comparing the subject wherein it is to one another, in respect of that simple idea, v. g. whiter, sweeter, bigger, equal, more, &c. These relations depending on the equality and excess of the same simple idea in several subjects, may be called, if one will, proportional; and that these are only conversant about those simple ideas received from sensation or reflection, is so evident, that nothing need be said to evince it.

§ 2. *Natural*.—*Secondly*, Another occasion of comparing things together, or considering one thing, so as to include in that consideration some other thing, is the circumstances of their origin or beginning; which being not afterwards to be altered, make the relations depending thereon, as lasting as the subjects to which they belong; v. g. father and son, brothers, cousin-germans, &c., which have their relations by one community of blood, wherein they partake in several degrees; countrymen, i. e. those who were born in the same country, or tract of ground: and these I call natural relations: wherein we may observe, that mankind have fitted their notions and words to the use of common life, and not to the truth and extent of things. For it is certain, that in reality, the relation is the same betwixt the begetter and the begotten, in the several races of other animals, as well as men; but yet it is seldom said, this bull is the grandfather of such a calf; or that two pigeons are cousin-germans. It is very convenient, that by distinct names, these relations should be observed, and marked out in mankind, there being occasion, both in laws, and other communications one with another, to mention and take notice of men under these relations; from whence also arise the obligations of several duties amongst men: whereas in brutes, men having very little or no cause to mind these relations, they have not thought fit to give them distinct and peculiar names. This, by the way, may give us some light into the different state and growth of languages: which being suited only to the convenience of communication, are proportioned to the notions men have, and the commerce of thoughts familiar amongst them; and not to the reality or extent of things, nor to the various respects might be found among them; nor the different abstract considerations might be framed about them. Where they had no philosophical notions, there they had no terms to express them; and it is no wonder men should have framed no names for those things they found no occasion to discourse of. From whence it is easy to imagine, why, as in some countries, they may not have so much as the name for a horse; and in others, where they are more careful of the pedigrees of their horses than of their own, that there they may have, not only names for particular horses, but also of their several relations of kindred one to another.

§ 3. *Instituted.*—*Thirdly*, Sometimes the foundation of considering things, with reference to one another, is some act whereby any one comes by a moral right, power, or obligation to do something. Thus a general is one that hath power to command an army; and an army under a general, is a collection of armed men, obliged to obey one man. A citizen or a burgher, is one who has a right to certain privileges in this or that place. All this sort, depending upon men's wills, or agreement in society, I call instituted, or voluntary, and may be distinguished from the natural, in that they are most, if not all, of them, some way or other alterable, and separable from the persons to whom they have sometimes belonged, though neither of the substances, so related, be destroyed. Now, though these are all reciprocal, as well as the rest, and contain in them a reference of two things one to the other; yet because one of the two things often wants a relative name, importing that reference, men usually take no notice of it, and the relation is commonly overlooked, v. g. a patron and client are easily allowed to be relations; but a constable, or dictator, are not so readily, at first hearing, considered as such; because there is no peculiar name for those who are under the command of a dictator, or constable, expressing a relation to either of them; though it be certain, that either of them hath a certain power over some others; and so is so far related to them, as well as a patron is to his client, or general to his army.

§ 4. *Moral.*—*Fourthly*, There is another sort of relation, which is the conformity or disagreement men's voluntary actions have to a rule to which they are referred, and by which they are judged of; which, I think, may be called moral relation, as being that which denominates our moral actions, and deserves well to be examined, there being no part of knowledge wherein we should be more careful to get determined ideas, and avoid, as much as may be, obscurity and confusion. Human actions, when with their various ends, objects, manners, and circumstances, they are framed into distinct complex ideas, are, as has been shewn, so many mixed modes, a great part whereof have names annexed to them. Thus, supposing gratitude to be a readiness to acknowledge and return kindness received; polygamy to be the having more wives than one at once; when we frame these notions thus in our minds, we have there so many determined ideas of mixed modes. But this is not all that concerns our actions; it is not enough to have determined ideas of them, and to know what names belong to such and such combinations of ideas. We have a farther and greater concernment, and that is, to know whether such actions, so made up, are morally good or bad.

§ 5. *Moral good and evil.*—Good and evil, as hath been shewn, b. 2. c. 20. § 2. and c. 21. § 42. are nothing but pleasure or pain, or that which occasions or procures pleasure or pain to us. Moral good and evil, then, is only the conformity or disagreement of our voluntary actions to some law, whereby good or evil is drawn on us by the will and power of the law-maker: which good and evil, pleasure or pain, attending our observance, or breach of the law, by the decree of the law-maker, is that we call reward and punishment.

§ 6. *Moral rules.*—Of these moral rules, or laws, to which men

generally refer, and by which they judge of the rectitude or pravity of their actions, there seem to me to be three sorts, with their three different enforcements, or rewards and punishments. For since it would be utterly in vain to suppose a rule set to the free actions of man, without annexing to it some enforcement of good and evil, to determine his will, we must, wherever we suppose a law, suppose also some reward or punishment annexed to that law. It would be in vain for one intelligent being to set a rule to the actions of another, if he had it not in his power to reward the compliance with, and punish deviation from, his rule, by some good and evil, that is not the natural product and consequence of the action itself; for that being a natural convenience, or inconvenience, would operate of itself, without a law. This, if I mistake not, is the true nature of all law, properly so called.

§ 7. *Laws.*—The laws that men generally refer their actions to, to judge of their rectitude or obliquity, seem to me to be these three: 1. The divine law. 2. The civil law. 3. The law of opinion or reputation, if I may so call it. By the relation they bear to the first of these, men judge whether their actions are sins or duties; by the second, whether they be criminal or innocent; and by the third, whether they be virtues or vices.

§ 8. *Divine law, the measure of sin and duty.*—*First,* The divine law, whereby I mean that law which God has set to the actions of men, whether promulgated to them by the light of nature, or the voice of revelation. That God has given a rule whereby men should govern themselves, I think there is nobody so brutish as to deny. He has a right to do it; we are his creatures; he has goodness and wisdom to direct our actions to that which is best; and he has power to enforce it by rewards and punishments, of infinite weight and duration, in another life; for nobody can take us out of his hands. This is the only true touchstone of moral rectitude; and by comparing them to this law it is that men judge of the most considerable moral good or evil of their actions; that is, whether as duties or sins, they are like to procure their happiness or misery from the hands of the Almighty.

§ 9. *Civil law, the measure of crimes and innocence.*—*Secondly,* The civil law, the rule set by the commonwealth to the actions of those who belong to it, is another rule to which men refer their actions, to judge whether they be criminal or no. This law nobody overlooks; the rewards and punishments that enforce it, being ready at hand, and suitable, to the power that makes it; which is the force of the commonwealth, engaged to protect the lives, liberties, and possessions of those who live according to its laws; and has power to take away life, liberty, or goods from him who disobeys; which is the punishment of offences committed against this law.

§ 10. *Philosophical law, the measure of virtue and vice.*—*Thirdly,* The law of opinion, or reputation. Virtue and vice are names pretended, and supposed, every where to stand for actions in their own nature, right and wrong; and as far as they really are so applied, they so far are co-incident with the divine law above-mentioned. But yet, whatever is pretended, this is visible, that these names, virtue and vice, in the particular instances of their application, through the several na-

tions and societies of men in the world, are constantly attributed only to such actions, as, in each country and society, are in reputation or discredited. Nor is it to be thought strange, that men every where should give the name of virtue to those actions, which, amongst them, are judged praiseworthy; and call that vice, which they account blameable; since, otherwise, they would condemn themselves, if they should think any thing right, to which they allowed not commendation; any thing wrong, which they let pass without blame. Thus, the measure of what is every where called and esteemed virtue and vice, is the approbation or dislike, praise, or blame, which, by a secret and tacit consent, establishes itself in the several societies, tribes, and clubs of men in the world, whereby several actions come to find credit or disgrace amongst them, according to the judgment, maxims, or fashion of that place. For though men uniting into politic societies, have resigned up to the public the disposing of all their force, so that they cannot employ it against any fellow-citizens, any farther than the law of the country directs; yet they retain still the power of thinking well or ill, approving or disapproving, of the actions of those whom they live amongst, and converse with; and by this approbation and dislike, they establish amongst themselves what they will call virtue and vice.

§ 11. That this is the common measure of virtue and vice, will appear to any one who considers, that though that passes for vice in one country, which is counted a virtue, or at least not vice, in another; yet every where, virtue and praise, vice and blame, go together. Virtue is every where that which is thought praiseworthy; and nothing else but that which has the allowance of public esteem, is called virtue.*

* Our author, in his preface to the fourth edition, taking notice how apt men have been to mistake him, added what here follows. "Of this, the ingenious author of the discourse concerning the nature of man, has given me a late instance, to mention no other. For the civility of his expressions, and the candour that belongs to his order, forbid me to think, that he would have closed his preface with an insinuation, as if in what I had said, book 2, chap. 28, concerning the third rule, which men refer their actions to, I went about to make virtue vice, and vice virtue, unless he had mistaken my meaning, which he could not have done, if he had but given himself the trouble to consider what the argument was I was then upon, and what was the chief design of that chapter, plainly enough set down in the fourth section, and those following. For I was there not laying down moral rules, but shewing the original and nature of moral ideas, and enumerating the rules men make use of in moral relations, whether those rules were true or false: and pursuant thereunto, I tell what has every where that denomination, which, in the language of that place, answers to virtue and vice in ours, which alters not the nature of things, though men do generally judge of, and denominate, their actions according to the esteem and fashion of the place, or sect, they are of.

"If he had been at the pains to reflect on what I had said, b. 1. c. 3. § 18, and in this present chapter, § 13, 14, 15, and 20, he would have known what I think of the eternal and unalterable nature of right and wrong, and what I call virtue and vice: and if he had observed, that in the place he quotes, I only report as matter of fact, what others call virtue and vice, he would not have found it liable to any great exception. For, I think, I am not much out in saying, That one of the rules made use of in the world for a ground or measure of a moral relation, is that esteem and reputation which several sorts of actions find variously in the several societies of men, according to which they are there called virtues or vices; and whatsoever authority the learned Mr. Lowde places in his old English Dictionary, I dare say it no where tells him (if I should appeal to it), that the same action is not in credit, called and counted a virtue in one place, which being in disrepute, passes for, and under the name of, vice, in another. The taking notice that men bestow the names of virtue and vice according to this rule of reputation, is all I have done, or can be laid to my charge to have done, towards the making vice virtue, and virtue vice. But the good

Virtue and praise are so united, that they are called often by the same name. "Sunt sua præmia laudi," says Virgil; and so Cicero, "nihil habet natura præstantius, quam honestatem, quam laudem, quam dignitatem, quam decus;" which, he tells you, are all names for the same thing, *Tusc. l. ii.* This is the language of the Heathen philosophers, who well understood wherein their notions of virtue and vice consisted. And though, perhaps, by the different temper, education, fashion, maxims, or interest of different sorts of men, it fell out, that what was thought praiseworthy in one place, escaped not censure in another;

man does well, and as becomes his calling, to be watchful in such points, and to take the alarm, even at expressions, which standing alone by themselves, might sound ill, and be suspected.

"It is to this zeal allowable in his function, that I forgive his citing, as he does, these words of mine in § 11 of this chapter: 'The exhortations of inspired teachers have not feared to appeal to common repute, "whatsoever things are lovely, whatsoever things are of good report, if there be any virtue, if there be any praise," &c. *Phil. iv. 8.* without taking notice of those immediately preceding, which introduce them, and run thus; 'whereby in the corruption of manners, the true boundaries of the law of nature, which ought to be the rule of virtue and vice, were pretty well preserved: so that even the exhortations of inspired teachers,' &c. By which words, and the rest of that section, it is plain, that I brought this passage of St. Paul not to prove that the general measure of what men call virtue and vice, throughout the world, was the reputation and fashion of each particular society within itself; but to shew, that though it were so, yet, for reasons I there give men, in that way of denominating their actions, did not, for the most part, much vary from the law of nature, which is that standing and unalterable rule, by which they ought to judge of the moral rectitude and pravity of their actions, and accordingly denominate them virtues or vices. Had Mr. Lowde considered this, he would have found it little to his purpose, to have quoted that passage in a sense I used it not; and would, I imagine, have spared the explication he subjoins to it, as not very necessary. But I hope this second edition will give him satisfaction in the point, and that this matter, is now so expressed, as to shew him there was no cause of scruple.

"Though I am forced to differ from him in those apprehensions he has expressed in the latter end of his preface, concerning what I had said about virtue and vice; yet we are better agreed than he thinks, in what he says in his third chapter, p. 78, concerning natural inscription, and innate notions. I shall not deny him the privilege he claims, p. 52, to state the question as he pleases, especially when he states it so, as to leave nothing in it contrary to what I have said: for according to him, innate notions being conditional things depending upon the concurrence of several other circumstances, in order to the soul's exerting them, all that he says for innate, imprinted, impressed notions (for of innate ideas he says nothing at all), amounts at last only to this; that there are certain propositions, which though the soul from the beginning, or when a man is born, does not know, yet, by assistance from the outward senses, and the help of some previous cultivation, it may afterwards come certainly to know the truth of; which is no more than what I have affirmed in my first book. For I suppose by the soul's exerting them, he means its beginning to know them; or else the soul's exerting of notions, will be to me a very unintelligible expression; and, I think, at best is a very unfit one in this case, it misleading men's thoughts by an insinuation, as if these notions were in the mind before the soul exerts them, i. e. before they are known: whereas truly before they are known, there is nothing of them in the mind, but a capacity to know them, when the concurrence of those circumstances, which this ingenious author thinks necessary, in order to the soul's exerting them, brings them into our knowledge.

"P. 52, I find him express it thus: 'These natural notions are not so imprinted upon the soul, as that they naturally and necessarily exert themselves (even in children and idiots) without any assistance from the outward senses, or without the help of some previous cultivation.' Here he says they exert themselves, as p. 78, that the soul exerts them. When he has explained to himself or others what he means by the soul's exerting innate notions, or their exerting themselves, and what that previous cultivation and circumstances, in order to their being exerted, are; he will, I suppose, find there is so little of controversy between him and me in the point, bating that he calls that exerting of notions, which I, in a more vulgar style, call knowing, that I have reason to think he brought in my name upon this occasion only out of the pleasure he has to speak civilly of me; which I must gratefully acknowledge he has done, wherever he mentions me, not without conferring on me, as some others have done, a title I have no right to."

and so in different societies, virtues and vices were changed : yet, as to the main, they, for the most part, kept the same every where. For since nothing can be more natural, than to encourage with esteem and reputation, that wherein every one finds his advantage ; and to blame and discountenance the contrary ; it is no wonder that esteem and discredit, virtue and vice, should, in a great measure, every where correspond with the unchangeable rule of right and wrong, which the law of God hath established ; there being nothing that so directly and visibly secures and advances the general good of mankind in this world, as obedience to the laws he has set them, and nothing that breeds such mischiefs and confusion, as the neglect of them. And, therefore, men, without renouncing all sense and reason, and their own interest, which they are so constantly true to, could not generally mistake in placing their commendation and blame on that side that really deserved it not. Nay, even those men, whose practice was otherwise, failed not to give their approbation right ; few being depraved to that degree as not to condemn, at least in others, the faults they themselves were guilty of : whereby even in the corruption of manners, the true boundaries of the law of nature, which ought to be the rule of virtue and vice, were pretty well preserved. So that even the exhortations of inspired teachers have not feared to appeal to common repute : “ Whatsoever is lovely, whatsoever is of good report, if there be any virtue, if there be any praise,” &c. Phil. iv. 8.

§ 12. *Its enforcement, commendation, and discredit.*—If any one should imagine, that I forgot my own notion of a law, when I make the law whereby men judge of virtue and vice, to be nothing else but the consent of private men, who have not authority enough to make a law ; especially wanting that which is so necessary and essential to a law, a power to enforce it ; I think I may say, that he who imagines commendation and disgrace, not to be strong motives to men, to accommodate themselves to the opinions and rules of those with whom they converse, seems little skilled in the nature or history of mankind : the greatest part whereof he shall find to govern themselves chiefly, if not solely, by this law of fashion ; and so they do that which keeps them in reputation with their company, little regard the laws of God or the magistrate. The penalties that attend the breach of God’s laws, some, nay, perhaps most, men, seldom seriously reflect on ; and amongst those that do, many, whilst they break the law, entertain thoughts of future reconciliation, and making their peace for such breaches : and as to the punishments due from the laws of the commonwealth, they frequently flatter themselves with the hopes of impunity. But no man escapes the punishment of their censure and dislike, who offends against the fashion and opinion of the company he keeps, and would recommend himself to. Nor is there one of ten thousand, who is stiff and insensible enough to bear up under the constant dislike and condemnation of his own club. He must be of a strange and unusual constitution, who can content himself to live in constant disgrace and disrepute with his own particular society. Solitude many men have sought, and been reconciled to : but nobody, that has the least thought or sense of a man about him, can live in society under the constant dislike and ill opinion

of his familiars, and those he converses with. This is a burden too heavy for human sufferance: and he must be made up of irreconcilable contradictions, who can take pleasure in company, and yet be insensible of contempt and disgrace from his companions.

§ 13. *These three laws, the rules of moral good and evil.*—These three then, *First*, The law of God; *Secondly*, The law of politic societies; *Thirdly*, The law of fashion, or private censure; are those to which men variously compare their actions: and it is by their conformity to one of these laws, that they take their measures, when they would judge of their moral rectitude, and denominate their actions good or bad.

§ 14. *Morality is the relation of actions to these rules.*—Whether the rule, to which, as to a touch-stone, we bring our voluntary actions, to examine them by, and try their goodness, and accordingly to name them; which is, as it were, the mark of the value we set upon them; whether, I say, we take that rule from the fashion of the country, or the will of the law-maker, the mind is easily able to observe the relation any action hath to it; and to judge whether the action agrees, or disagrees, with the rule; and so hath a notion of moral goodness or evil, which is either conformity or not conformity, of any action to that rule; and, therefore, is often called moral rectitude. This rule being nothing but a collection of several simple ideas, the conformity thereto is but so ordering the action, that the simple ideas belonging to it, may correspond to those which the law requires. And thus we see how moral beings and notions are founded on, and terminated in, these simple ideas we have received from sensation or reflection. For example, Let us consider the complex idea we signify by the word murder; and when we have taken it asunder, and examined all the particulars, we shall find them to amount to a collection of simple ideas derived from reflection or sensation, viz. *First*, From reflection on the operations of our own mind, we have the ideas of willing, considering, proposing before-hand, malice, or wishing ill to another; and also of life, or perception, and self-motion. *Secondly*, From sensation, we have the collection of those simple sensible ideas which are to be found in a man, and of some action, whereby we put an end to perception and motion in the man; all which simple ideas, are comprehended in the word murder. This collection of simple ideas being found by me to agree or disagree with the esteem of the country I have been bred in, and to be held by most men there, worthy praise or blame, I call the action virtuous or vicious: if I have the will of a supreme, invisible, Law-giver for my rule; then, as I supposed the action commanded or forbidden by God, I call it good or evil, sin or duty: and if I compare it to the civil law, the rule made by the legislative power of the country, I call it lawful or unlawful, a crime or no crime. So that whencesoever we take the rule of moral actions, or by what standard soever we frame in our minds the ideas of virtues or vices, they consist only, and are made up of collections of simple ideas, which we originally received from sense or reflection, and their rectitude or obliquity consists in the agreement or disagreement with those patterns prescribed by some law.

§ 15. To conceive rightly of moral actions, we must take notice

of them under this two-fold consideration. *First*, As they are in themselves each made up of such a collection of simple ideas. Thus drunkenness or lying, signify such or such a collection of simple ideas, which I call mixed modes; and in this sense, they are as much positive absolute ideas, as the drinking of a horse, or speaking of a parrot. *Secondly*, Our actions are considered as good, bad, or indifferent; and in this respect, they are relative; it being their conformity to, or disagreement with, some rule, that makes them to be regular or irregular, good or bad: and so, as far as they are compared with a rule, and thereupon denominated, they come under relation. Thus the challenging and fighting with a man, as it is a certain positive mode, or particular sort of action, by particular ideas distinguished from all others, is called duelling: which, when considered in relation to the law of God, will deserve the name sin; to the law of fashion, in some countries, valour and virtue; and to the municipal laws of some governments, a capital crime. In this case, when the positive mode has one name, and another name as it stands in relation to the law, the distinction may as easily be observed, as it is in substances, where one name, v. g. man, is used to signify the thing; another, v. g. father, to signify the relation.

§ 16. *The denominations of actions often mislead us.*—But because very frequently the positive idea of the action, and its moral relation, are comprehended together under one name, and the same word made use of to express both the mode or action, and its moral rectitude or obliquity; therefore, the relation itself is less taken notice of; and there is often no distinction made between the positive idea of the action, and the reference it has to a rule. By which confusion of these two distinct considerations under one term, those who yield too easily to the impressions of sounds, and are forward to take names for things, are often misled in their judgment of actions. Thus, the taking from another what is his, without his knowledge or allowance, is properly called stealing: but that name being commonly understood to signify also the moral pravity of the action, and to denote its contrariety to the law, men are apt to condemn whatever they hear called stealing, as an ill action, disagreeing with the rule of right. And yet, the private taking away this sword from a madman, to prevent his doing mischief, though it be properly denominated stealing, as the name of such a mixed mode; yet, when compared to the law of God, and considered in its relation to that supreme rule, it is no sin or transgression, though the name stealing ordinarily carries such an intimation with it.

§ 17. *Relations innumerable.*—And thus much for the relation of human actions to a law, which, therefore, I call moral relation.

It would make a volume to go over all sorts of relations: it is not therefore to be expected, that I should here mention them all. It suffices to our present purpose, to shew by these, what the ideas are we have of this comprehensive consideration, called relation: which is so various, and the occasions of it so many (as many as there can be of comparing things one to another), that it is not very easy to reduce it rules, or under just heads. Those I have mentioned, I think, are some of the most considerable, and such as may serve to let us see from whence we get our ideas of relations, and wherein they are founded.

But before I quit this argument, from what has been said, give me leave to observe :

§ 18. *All relations terminate in simple ideas* — *First*, That it is evident, that all relation terminates in, and is ultimately founded on, those simple ideas we have got from sensation or reflection : so that all we have in our thoughts ourselves (if we think of any thing, or have any meaning), or would signify to others, when we use words standing for relations, is nothing but some simple ideas, or collections of simple ideas, compared one with another. This is so manifest in that sort called proportional, that nothing can be more. For when a man says, honey is sweeter than wax, it is plain, that his thoughts in this relation, terminate in this simple idea, sweetness, which is equally true of all the rest; though, where they are compounded, or decomposed, the simple ideas they are made up of, are, perhaps, seldom taken notice of; v. g. when the word father is mentioned : *First*, There is meant that particular species, or collective idea, signified by the word man. *Secondly*, Those sensible simple ideas signified by the word generation : and, *Thirdly*, the effects of it, and all the simple ideas signified by the word child. So the word friend, being taken for a man who loves, and is ready to do good to another, has all these following ideas to the making of it up : *First*, All the simple ideas comprehended in the word man, or intelligent being. *Secondly*, The idea of love. *Thirdly*, The idea of readiness, or disposition. *Fourthly*, The idea of action, which is any kind of thought or motion. *Fifthly*, The idea of good, which signifies any thing that may advance his happiness, and terminates at last, if examined, in particular simple ideas, of which the word good, in general, signifies any one ; but if removed from all simple ideas quite, it signifies nothing at all. And thus also all moral words terminate at last, though, perhaps, more remotely, in a collection of simple ideas : the immediate signification of relative words, being very often other supposed known relations ; which, if traced one to another, still end in simple ideas.

§ 19. *We have ordinarily as clear (or clearer) a notion of the relation, as of its foundation.*—*Secondly*, That in relations, we have for the most part, if not always, as clear a notion of the relation, as we have of those simple ideas wherein it is founded : agreement or disagreement, whereon relation depends, being things whereof we have commonly as clear ideas as of any other whatsoever : it being but the distinguishing simple ideas, or their degrees, one from another, without which we could have no distinct knowledge at all. For if I have a clear idea of sweetness, light, or extension, I have too, of equal, or more, or less, of each of these : if I know what it is for one man to be born of a woman, viz. Sempronia, I know what it is for another man to be born of the same woman, Sempronia ; and so have as clear a notion of brothers, as of births, and perhaps clearer. For if I believed that Sempronia digged Titus out of the parsley-bed (as they use to tell children), and thereby became his mother ; and that afterward in the same manner she digged Caius out of the parsley-bed, I had as clear a notion of the relation of brothers between them, as if I had all the skill of a midwife ; the notion that the same woman contributed, as mother,

equally to their births (though I were ignorant or mistaken in the manner of it), being that on which I grounded the relation, and that they agreed in that circumstance of birth, let it be what it will. The comparing them then in their descent from the same person, without knowing the particular circumstances of that descent, is enough to found my notion of their having or not having the relation of brothers. But though the ideas of particular relations are capable of being as clear and distinct in the minds of those who will duly consider them, as those of mixed modes, and more determinate than those of substances; yet the names belonging to relation, are often of as doubtful and uncertain signification, as those of substances or mixed modes; and much more than those of simple ideas: because relative words being the marks of this comparison, which is made only by men's thoughts, and is an idea only in men's minds, men frequently apply them to different comparisons of things, according to their own imaginations, which do not always correspond with those of others using the same names.

§ 20. *The notion of the relation is the same, whether the rule and action to be compared is true or false.*—Thirdly, That in these I call moral relations, I have a true notion of relation by comparing the action with the rule, whether the rule be true or false. For if I measure any thing by a yard, I know whether the thing I measure be longer or shorter than that supposed yard, though, perhaps, the yard I measure by, be not exactly the standard; which, indeed, is another inquiry. For though the rule be erroneous, and I mistaken in it, yet the agreement or disagreement observable in that which I compare with, makes me perceive the relation. Though measuring by a wrong rule, I shall thereby be brought to judge amiss of its moral rectitude, because I have tried it by that which is not the true rule, yet I am not mistaken in the relation which that action bears to that rule I compare it to, which is agreement, or disagreement.

CHAP. XXIX.

OF CLEAR AND OBSCURE, DISTINCT AND CONFUSED IDEAS.

§ 1. *Ideas, some clear and distinct, others obscure and confused.*—Having shewn the original of our ideas, and taken a view of their several sorts; considered the difference between the simple and the complex, and observed how the complex ones are divided into those of modes, substances, and relations; all which, I think, is necessary to be done by any one who would acquaint himself thoroughly with the progress of the mind in its apprehension and knowledge of things, it will, perhaps, be thought I have dwelt long enough upon the examination of ideas. I must, nevertheless, crave leave to offer some few other considerations concerning them. The first is, that some are clear, and others obscure; some distinct, and others confused.

§ 2. *Clear and obscure, explained by sight.*—The perception of the mind being most aptly explained by words relating to the sight, we shall best understand what is meant by clear and obscure in our ideas,

by reflecting on what we call clear and obscure in the objects of sight, light being that which discovers to us visible objects, we give the name of obscure to that which is not placed in a light sufficient to discover minutely to us the figure and colours which are observable in it, and which, in a better light, would be discernible. In like manner, our simple ideas are clear, when they are such as the objects themselves, from whence they were taken, did or might, in a well-ordered sensation or perception, present them. Whilst the memory retains them thus, and can produce them to the mind, whenever it has occasion to consider them, they are clear ideas. So far as they either want any thing of the original exactness, or have lost any of their first freshness, and are, as it were, faded or tarnished by time, so far are they obscure. Complex ideas, as they are made up of simple ones, so they are clear, when the ideas that go to their composition are clear; and the number and order of those simple ideas, that are the ingredients of any complex one, is determinate and certain.

§ 3. *Causes of obscurity.*—The causes of obscurity in simple ideas, seem to be either dull organs, or very slight and transient impressions made by the objects; or else a weakness in the memory not able to retain them as received. For to return again to visible objects, to help us to apprehend this matter; if the organs or faculties of perception, like wax over-hardened with cold, will not receive the impression of the seal, from the usual impulse wont to imprint it; or, like wax of a temper too soft, will not hold it well when well imprinted; or else supposing the wax of a temper fit, but the seal not applied with a sufficient force to make a clear impression; in any of these cases, the print left by the seal, will be obscure. This, I suppose, needs no application to make it plainer.

§ 4. *Distinct and confused, what.*—As a clear idea is that whereof the mind has such a full and evident perception, as it does receive from an outward object operating duly on a well-disposed organ; so a distinct idea is that wherein the mind perceives a difference from all other; and a confused idea is such a one as is not sufficiently distinguishable from another, from which it ought to be different.

§ 5. *Objection.*—If no idea be confused, but such as is not sufficiently distinguishable from another, from which it should be different; it will be hard, may any one say, to find any where a confused idea. For let any idea be as it will, it can be no other but such as the mind perceives it to be; and that every perception sufficiently distinguishes it from all other ideas, which cannot be other, i. e. different, without being perceived to be so. No idea, therefore, can be undistinguishable from another, from which it ought to be different, unless you would have it different from itself; from all other, it is evidently different.

§ 6. *Confusion of ideas is in reference to their names.*—To remove this difficulty, and to help us to conceive aright what it is that makes the confusion ideas are at any time chargeable with, we must consider, that things ranked under distinct names, are supposed different enough to be distinguished; and so each sort, by its peculiar name, may be marked, and discoursed of apart upon any occasion; and there is nothing more evident, than that the greatest part of different names are

supposed to stand for different things. Now, every idea a man has, being visibly what it is, and distinct from all other ideas but itself, that which makes it confused, is, when it is such, that it may as well be called by another name, as that which it is expressed by, the difference which keeps the things (to be ranked under those two different names) distinct, and makes some of them belong rather to the one, and some of them to the other, of those names, being left out; and so the distinction, which was intended to be kept up by those different names, is quite lost.

§ 7. *Defaults which make confusion.*—The defaults which usually occasion this confusion, I think, are chiefly these following:

First, complex ideas made up of too few simple ones.—*First*, When any complex idea (for it is complex ideas that are most liable to confusion) is made up of too small a number of simple ideas, and such only as are common to other things, whereby the differences that make it, deserve a different name, are left out. Thus, he that has an idea made up of barely the simple ones of a beast with spots, has but a confused idea of a leopard, it not being thereby sufficiently distinguished from a lynx, and several other sorts of beasts, that are spotted. So that such an idea, though it has the peculiar name leopard, is not distinguishable from those designed by the names lynx, or panther, and may as well come under the name lynx, as leopard. How much the custom of defining of words by general terms, contributes to make the ideas we would express by them confused and undetermined, I leave others to consider. This is evident, that confused ideas are such as render the use of words uncertain, and take away the benefit of distinct names. When the ideas for which we use different terms, have not a difference answerable to their distinct names, and so cannot be distinguished by them, there it is that they are truly confused.

§ 8. *Secondly, or its simple ones jumbled disorderly together.*—*Secondly*, Another fault which makes our ideas confused, is when though the particulars that make up any ideas, are in number enough; yet they are so jumbled together, that it is not easily discernible, whether it more belongs to the name that is given it, than to any other. There is nothing more proper to make us conceive this confusion, than a sort of pictures usually shewn as surprising pieces of art, wherein the colours, as they are laid by the pencil on the table itself, mark out very odd and unusual figures, and have no discernible order in their position. This draught thus made up of parts, wherein no symmetry nor order appears, is, in itself, no more a confused thing, than the picture of a cloudy sky; wherein, though there be as little order of colours or figures to be found, yet nobody thinks it a confused picture. What is it then that makes it to be thought confused, since the want of symmetry does not? as it is plain it does not; for another draught made barely in imitation of this, could not be called confused. I answer, that which makes it be thought confused, is the applying it to some name, to which it does no more discernibly belong, than to some other: v. g. when it is said to be the picture of a man, or Cæsar, then any one with reason counts it confused. Because it is not discernible in that state to belong more to the name man, or Cæsar, than to the name

baboon, or Pompey, which are supposed to stand for different ideas from those signified by man, or Cæsar. But when a cylindrical mirror, placed right, hath reduced those irregular lines on the table into their due order and proportion, then the confusion ceases, and the eye presently sees that it is a man, or Cæsar; i. e. that it belongs to those names; and that it is sufficiently distinguishable from a baboon, or Pompey; i. e. from the ideas signified by those names. Just thus it is with our ideas, which are, as it were, the pictures of things. No one of these mental draughts, however the parts are put together, can be called confused (for they are plainly discernible as they are), till it be ranked under some ordinary name, to which it cannot be discerned to belong, any more than it does to some other name, of an allowed different signification.

§ 9. *Thirdly, or are mutable and undetermined.*—*Thirdly*, A third defect that frequently gives the name of confused to our ideas, is, when any one of them is uncertain, and undetermined. Thus we may observe men, who not forbearing to use the ordinary words of their language, till they have learned their precise signification, change the idea they make this or that term stand for, almost as often as they use it. He that does this out of uncertainty of what he should leave out, or put into, his idea of church, or idolatry, every time he thinks of either, and holds not steady to any one precise combination of ideas that makes it up, is said to have a confused idea of idolatry, or the church; though this be still for the same reason as the former, viz. because a mutable idea (if we will allow it to be one idea) cannot belong to one name, rather than another; and so loses the distinction that distinct names are designed for.

§ 10. *Confusion without reference to names, hardly conceivable.*—By what has been said, we may observe how much names, as supposed steady signs of things, and by their difference to stand for and keep things distinct, that in themselves are different, are the occasion of denominating ideas distinct or confused, by a secret and unobserved reference the mind makes of its ideas to such names. This, perhaps, will be fuller understood, after what I say of words, in the third book, has been read and considered. But without taking notice of such a reference of ideas to distinct names, as the signs of distinct things, it will be hard to say what a confused idea is. And, therefore, when a man designs, by any name, a sort of things, or any one particular thing, distinct from all others, the complex idea he annexes to that name, is the more distinct, the more particular the ideas are, and the greater and more determinate the number and order of them are, whereof it is made up. For the more it has of these, the more it has still of the perceivable differences whereby it is kept separate and distinct from all ideas belonging to other names, even those that approach nearest to it, and thereby all confusion with them is avoided.

§ 11. *Confusion concerns always two ideas.*—Confusion, making it a difficulty to separate two things that should be separated, concerns always two ideas; and those most, which most approach one another. Whenever, therefore, we suspect any idea to be confused, we must examine what other it is in danger to be confounded with, or which it

cannot easily be separated from, and that will always be found an idea belonging to another name, and so should be a different thing from which yet it is not sufficiently distinct; being either the same with it, or making a part of it, or at least, as properly called by that name, as the other it is ranked under; and so keeps not that difference from that other idea, which the different names import.

§ 12. *Causes of confusion.*—This, I think, is the confusion proper to ideas, which still carries with it a secret reference to names. At least, if there be any other confusion of ideas, this is that which most of all disorders men's thoughts and discourses: ideas, as ranked under names, being those that for the most part men reason of within themselves, and always those which they commune about with others. And, therefore, where there are supposed two different ideas marked by two different names, which are not as distinguishable as the sounds that stand for them, there never fails to be confusion: and where any ideas are distinct, as the ideas of those two sounds they are marked by, there can be between them no confusion. The way to prevent it, is to collect and unite into one complex idea, as precisely as is possible, all those ingredients whereby it is differenced from others; and to them so united in a determinate number and order, apply steadily the same name. But this neither accommodating men's ease or vanity, or serving any design but that of naked truth, which is not always the thing aimed at, such exactness is rather to be wished, than hoped for. And since the loose application of names to undetermined, variable, and almost no ideas, serves both to cover our own ignorance, as well as to perplex and confound others, which goes for learning and superiority in knowledge, it is no wonder that most men should use it themselves, whilst they complain of it in others. Though, I think, no small part of the confusion to be found in the notions of men, might, by care and ingenuity, be avoided; yet I am far from concluding it every where wilful. Some ideas are so complex, and made up of so many parts, that the memory does not easily retain the very same precise combination of simple ideas, under one name; much less are we able constantly to divine for what precise complex idea such a name stands in another man's use of it. From the first of these, follows confusion in a man's own reasonings and opinions within himself; from the latter, frequent confusion in discoursing and arguing with others. But having more at large treated of words, their defects and abuses, in the following book, I shall here say no more of it.

§ 13. *Complex ideas may be distinct in one part, and confused in another.*—Our complex ideas being made up of collections, and so variety of simple ones, may accordingly be very clear and distinct in one part, and very obscure and confused in another. In a man who speaks of a chiliædron, or a body of a thousand sides, the ideas of the figure may be very confused, though that of the number be very distinct; so that he being able to discourse and demonstrate concerning that part of his complex idea which depends upon the number of a thousand, he is apt to think he has a distinct idea of a chiliædron; though it be plain, he has no precise idea of its figure, so as to distinguish it by that, from one that has but nine hundred and ninety-nine

sides. The not observing whereof, causes no small error in men's thoughts, and confusion in their discourses.

§ 14. *This, if not heeded, causes confusion in our arguings.*—He that thinks he has a distinct idea of the figure of a chiliædron, let him, for trial's sake, take another parcel of the same uniform matter, viz. gold or wax, of an equal bulk, and make it into a figure of nine hundred and ninety-nine sides: he will, I doubt not, be able to distinguish these two ideas, one from another, by the number of sides; and reason and argue distinctly about them, whilst he keeps his thoughts and reasoning to that part only of these ideas, which is contained in their numbers; as that the sides of the one could be divided into two equal numbers; and of the others, not, &c. But when he goes about to distinguish them by their figure, he will there be presently at a loss, and not be able, I think, to frame in his mind two ideas, one of them distinct from the other, by the bare figure of these two pieces of gold; as he could, if the same parcels of gold were made one into a cube, the other a figure of five sides. In which incomplete ideas, we are very apt to impose on ourselves, and wrangle with others, especially where they have particular and familiar names. For being satisfied in that part of the idea, which we have clear; and the name which is familiar to us, being applied to the whole, containing that part also which is imperfect and obscure, we are apt to use it for that confused part, and draw deductions from it in the obscure part of its signification, as confidently as we do from the other.

§ 15. *Instance in eternity.*—Having frequently in our mouths the name eternity, we are apt to think we have a positive comprehensive idea of it, which is as much as to say, that there is no part of that duration which is not clearly contained in our idea. It is true, that he that thinks so, may have a clear idea of duration; he may also have a very clear idea of a very great length of duration; he may also have a clear idea of the comparison of that great one, with still a greater: but it not being possible for him to include in his idea of any duration, let it be as great as it will, the whole extent together of a duration, where he supposes no end, that part of his idea, which is still beyond the bounds of that large duration he represents to his own thoughts, is very obscure and undetermined. And hence it is, that in disputes and reasonings concerning eternity, or any other infinity, we are apt to blunder, and involve ourselves in manifest absurdities.

§ 16. *Divisibility of matter.*—In matter, we have no clear ideas of the smallness of parts, much beyond the smallest that occur to any of our senses; and, therefore, when we talk of the divisibility of matter *in infinitum*, though we have clear ideas of division and divisibility, and have also clear ideas of parts made out of a whole by division; yet we have but very obscure and confused ideas of corpuscles, or minute bodies so to be divided, when by former divisions they are reduced to a smallness much exceeding the perception of any of our senses; and so all that we have clear and distinct ideas of, is of what division in general or abstractly is, and the relation of totum and parts: but of the bulk of the body, to be thus infinitely divided after certain progressions, I think we have no clear nor distinct idea at all. For I ask any one,

whether taking the smallest atom of dust he ever saw, he has any distinct idea (bating still the number which concerns not extension) betwixt the 100,000th, and the 1,000,000th part of it? Or if he thinks he can refine his ideas to that degree, without losing sight of them, let him add ten cyphers to each of those numbers. Such a degree of smallness is not unreasonable to be supposed, since a division carried on so far, brings it no nearer the end of infinite division, than the first division into two halves, does. I must confess, for my part, I have no clear distinct ideas of the different bulk or extension of those bodies, having but a very obscure one of either of them. So that, I think, when we talk of division of bodies *in infinitum*, our idea of their distinct bulks, which is the subject and foundation of division, comes, after a little progression, to be confounded, and almost lost in obscurity. For that idea, which is to represent only bigness, must be very obscure and confused, which we cannot distinguish from one ten times as big, but only by number; so that we have clear distinct ideas, we may say, of ten and one, but no distinct ideas of two such extensions. It is plain from hence, that when we talk of infinite divisibility of body, or extension, our distinct and clear ideas are only of numbers: but the clear distinct ideas of extension, after some progress of division, are quite lost; and of such minute parts, we have no distinct ideas at all; but it returns, as all our ideas of infinite do, at last to that of number always to be added; but thereby never amounts to any distinct idea of actual infinite parts. We have, it is true, a clear idea of division, as often as we will think of it; but thereby we have no more a clear idea of infinite parts in matter, than we have a clear idea of an infinite number, by being able still to add new numbers to any assigned number we have: endless divisibility giving us no more a clear and distinct idea of actually infinite parts, than endless addibility (if I may so speak) gives us a clear and distinct idea of an actually infinite number. They both being only in a power still of increasing the number, be it already as great as it will. So that of what remains to be added (wherein consists the infinity), we have but an obscure, imperfect, and confused idea; from or about which we can argue or reason with no certainty or clearness, no more than we can in arithmetic, about a number of which we have no such distinct idea, as we have of four or one hundred: but only this relative obscure one, that compared to any other, it is still bigger: and we have no more a clear positive idea of it, when we say or conceive it is bigger, or more than 400,000,000, than if we should say, it is bigger than forty, or four; 400,000,000 having no nearer a proportion to the end of addition, or number, than four. For he that adds only four to four, and so proceeds, shall as soon come to the end of all addition, as he that adds 400,000,000 to 400,000,000; and so likewise in eternity, he that has an idea of but four years, has as much a positive complete idea of eternity, as he that has one of 400,000,000 of years: for what remains of eternity beyond either of these two numbers of years, is as clear to the one as the other; i. e. neither of them has any clear positive idea of it at all. For he that adds only four years to four, and so on, shall as soon reach eternity, as he that adds 400,000,000 of years, and so on; or if he please, doubles

the increase as often as he will ; the remaining abyss being still as far beyond the end of all these progressions, as it is from the length of a day, or an hour. For nothing finite bears any proportion to infinite ; and therefore our ideas, which are all finite, cannot bear any. Thus it is also in our idea of extension, when we increase it by addition, as well as when we diminish it by division, and would enlarge our thoughts to infinite space. After a few doublings of those ideas of extension, which are the largest we are accustomed to have, we lose the clear distinct idea of that space : it becomes a confusedly great one, with a surplus of still greater ; about which, when we would argue or reason, we shall always find ourselves at a loss ; confused ideas, in our arguings and deductions from that part of them which is confused, always leading us into confusion.

CHAP. XXX.

OF REAL AND FANTASTICAL IDEAS.

§ 1. *Real ideas are conformable to their archetypes.*—Besides what we have already mentioned concerning ideas, other considerations belong to them, in reference to things from whence they are taken, or which they may be supposed to represent ; and thus, I think, they may come under a threefold distinction ; and are, 1. Either real or fantastical. 2. Adequate or inadequate. 3. True or false,

First, By real ideas, I mean such as have a foundation in nature ; such as have a conformity with the real being and existence of things, or with their archetypes. Fantastical or chimerical, I call such as have no foundation in nature, nor have any conformity with that reality of being to which they are tacitly referred as their archetypes. If we examine the several sorts of ideas before mentioned, we shall find, that,

§ 2. *Simple ideas all real.*—*First*, Our simple ideas are all real, all agree to the reality of things. Not that they are all of them the images, or representations, of what does exist, the contrary whereof, in all but the primary qualities of bodies, hath been already shewn. But though whiteness and coldness are no more in snow, than pain is ; yet those ideas of whiteness and coldness, pain, &c., being in us the effects of powers in things without us, ordained by our Maker, to produce in us such sensations ; they are real ideas in us, whereby we distinguish the qualities that are really in things themselves. For these several appearances being designed to be the marks whereby we are to know and distinguish things which we have to do with, our ideas do as well serve us to that purpose, and are as real distinguishing characters, whether they be only constant effects, or else exact resemblances of something in the things themselves ; the reality lying in that steady correspondence they have with the distinct constitutions of real beings. But whether the answer to those constitutions, as to causes or patterns, it matters not it suffices that they are constantly produced by them. And thus our simple ideas are all real and true, because they answer and agree to those powers of things which produce them in our minds, that being all that is requisite to make them real, and not fictions at pleasur

For in simple ideas (as has been shewn), the mind is wholly confined to the operation of things upon it, and can make to itself no simple idea, more than what it has received.

§ 3. *Complex ideas are voluntary combinations.*—Though the mind be wholly passive, in respect of its simple ideas; yet I think we may say it is not so, in respect of its complex ideas; for those being combinations of simple ideas put together, and united under one general name, it is plain that the mind of man uses some kind of liberty in forming those complex ideas; how else comes it to pass, that one man's idea of gold, or justice, is different from another's? but because he has put in, or left out of his, some simple idea which the other has not. The question then is, which of these are real, and which barely imaginary combinations? What collections agree to the reality of things, and what not? And to this, I say, that,

§ 4. *Mixed modes, made of consistent ideas, are real.*—*Secondly*, Mixed modes and relations, having no other reality but what they have in the minds of men, there is nothing more required to this kind of ideas, to make them real, but that they be so framed, that there be a possibility of existing conformable to them. These ideas being themselves archetypes, cannot differ from their archetypes, and so cannot be chimerical, unless any one will jumble together in them inconsistent ideas. Indeed, as any of them have the names of a known language assigned to them, by which he that has them in his mind, would signify them to others, so bare possibility of existing is not enough; they must have a conformity to the ordinary signification of the name that is given them, that they may not be thought fantastical; as if a man would give the name of justice to that idea, which common use calls liberality. But this fantasticalness relates more to propriety of speech, than reality of ideas; for a man to be undisturbed in danger, sedately to consider what is fittest to be done, and to execute it steadily, is a mixed mode, or a complex idea of an action which may exist. But to be undisturbed in danger, without using one's reason or industry, is what is also possible to be; and so is as real an idea as the other. Though the first of these having the name courage given to it, may, in respect of that name, be a right or wrong idea; but the other, whilst it has not a common received name of any known language assigned to it, is not capable of any deformity, being made with no reference to any thing but itself.

§ 5. *Ideas of substances are real, when they agree with the existence of things.*—*Thirdly*, Our complex ideas of substances being made, all of them, in reference to things existing without us, and intended to be representations of substances, as they really are, are no farther real, than as they are such combinations of simple ideas, as are really united, and co-exist in things without us. On the contrary, those are fantastical, which are made up of such collections of simple ideas as were really never united, never were found together in any substance; v. g. a rational creature, consisting of a horse's head, joined to a body of human shape, or such as the centaurs are described; or, a body yellow, very malleable, fusible, and fixed; but lighter than common water: or, a uniform, unorganized body, consisting, as to sense, all of similar

parts, with perception and voluntary motion joined to it. Whether such substances as these can possibly exist, or no, it is probable we do not know: but be that as it will, these ideas of substances being made conformable to no pattern existing, that we know, and consisting of such collections of ideas as no substance ever shewed us united together, they ought to pass with us for barely imaginary; but much more are those complex ideas so, which contain in them any inconsistency or contradiction of their parts.

CHAP. XXXI.

OF ADEQUATE AND INADEQUATE IDEAS.

§ 1. *Adequate ideas are such as perfectly represent their archetypes.*—Of our real ideas, some are adequate, and some are inadequate. Those I call adequate, which perfectly represent those archetypes which the mind supposes them taken from; which it intends them to stand for, and to which it refers them. Inadequate ideas are such, which are but a partial or incomplete representation of those archetypes to which they are referred. Upon which account it is plain,

§ 2. *Simple ideas all adequate.*—*First,* That all our simple ideas are adequate: because, being nothing but the effects of certain powers in things, fitted and ordained by God, to produce such sensations in us, they cannot but be correspondent and adequate to those powers; and we are sure they agree to the reality of things. For if sugar produce in us the ideas which we call whiteness, and sweetness, we are sure there is a power in sugar to produce those ideas in our minds, or else they could not have been produced by it. And so each sensation answering the power that operates on any of our senses, the idea so produced, is a real idea (and not a fiction of the mind, which has no power to produce any simple idea); and cannot but be adequate, since it ought only to answer that power; and so all simple ideas are adequate. It is true, the things producing in us these simple ideas, are but few of them denominated by us, as if they were only the causes of them; but as if those ideas were real beings in them. For though fire be called painful to the touch, whereby is signified the power of producing in us the idea of pain: yet it is denominated also light and heat; as if light and heat were really something in the fire, more than a power to excite these ideas in us; and, therefore, are called qualities in, or of, the fire. But these being nothing, in truth, but powers to excite such ideas in us, I must, in that sense, be understood when I speak of secondary qualities, as being in things; or of their ideas, as being the objects that excite them in us. Such ways of speaking, though accommodated to the vulgar notions, without which one cannot be well understood, yet truly signify nothing but those powers which are in things, to excite certain sensations or ideas in us. Since were there no fit organs to receive the impressions fire make on the sight and touch; nor a mind joined to those organs to receive the ideas of light and heat, by those impressions from the fire or sun

there would yet be no more light or heat in the world, than there would be pain, if there were no sensible creature to feel it, though the sun should continue just as it is now, and Mount Etna flame higher than ever it did. Solidity and extension, and the termination of it, figure; with motion and rest, whereof we have the ideas, would be really in the world as they are, whether there were any sensible being to perceive them, or no; and, therefore, we have reason to look on those as the real modifications of matter, and such are the exciting causes of all our various sensations from bodies. But this being an inquiry not belonging to this place, I shall enter no farther into it, but proceed to shew what complex ideas are adequate, and what not.

§ 3. *Modes are all adequate.*—*Secondly*, Our complex ideas of modes, being voluntary collections of simple ideas, which the mind puts together, without reference to any real archetypes, or standing patterns, existing any where, are, and cannot but be, adequate ideas; because they not being intended for copies of things really existing, but for archetypes made by the mind, to rank and denominate things by, cannot want any thing; they having, each of them, that combination of ideas, and thereby that perfection which the mind intended they should; so that the mind acquiesces in them, and can find nothing wanting. Thus, by having the idea of a figure, with three sides, meeting at three angles, I have a complete idea, wherein I require nothing else to make it perfect. That the mind is satisfied with the perfection of this, its idea, is plain in that it does not conceive that any understanding hath, or can have, a more complete or perfect idea of that thing it signifies by the word triangle, supposing it to exist, than itself has in that complex idea of three sides, and three angles: in which is contained all that is, or can be, essential to it, or necessary to complete it, wherever or however it exists. But in our ideas of substances, it is otherwise. For their desiring to copy things, as they really do exist, and to represent to ourselves that constitution, on which all their properties depend, we perceive our ideas attain not that perfection we intend: we find they still want something we should be glad were in them; and so are all inadequate. But mixed modes, and relations, being archetypes without patterns, and so having nothing to represent but themselves, cannot but be adequate, every thing being so to itself. He that at first put together the idea of danger perceived, absence or disorder from fear, sedate consideration of what was justly to be done, and executing that without disturbance, or being deterred by the danger of it, had certainly in his mind that complex idea made up of that combination; and intending it to be nothing else but what it is, nor to have in it any other simple ideas but what it hath, it could not also but be an adequate idea; and laying this up in his memory, with the name courage annexed to it, to signify it to others, and denominate from thence any action he should observe to agree with it, had, thereby, a standard to measure and denominate actions by, as they agreed to it. This idea thus made, and laid up for a pattern, must necessarily be adequate, being referred to nothing else but itself, nor made by any other original, but the good-liking and will of him that first made this combination.

§ 4. *Modes in reference to settled names, may be inadequate.*—In-

deed, another coming after, and, in conversation, learning from him the word courage, may make an idea, to which he gives the name courage, different from what the first author applied it to, and has in his mind, when he uses it. And in this case, if he designs that his idea in thinking should be conformable to the other's idea, as the name he uses in speaking is conformable in sounds to his, from whom he learned it, his idea may be very wrong and inadequate; because, in this case, making the other man's idea the pattern of his idea in thinking, as the other man's word, or sound, is the pattern of his in speaking, his idea is so far defective and inadequate, as it is distant from the archetype and pattern he refers it to, and intends to express and signify by the name he uses for it; which name he would have to be a sign of the other man's idea (to which in its proper use, it is primarily annexed), and of his own, as agreeing to it; to which, if his own does not exactly correspond, it is faulty and inadequate.

§ 5. Therefore these complex ideas of modes, when they are referred by the mind, and intended to correspond to the ideas in the mind of some other intelligent being, expressed by the names we apply to them, they may be very deficient, wrong, and inadequate; because they agree not to that which the mind designs to be their archetype and pattern; in which respect only, any idea of modes can be wrong, imperfect, or inadequate. And on this account, our ideas of mixed modes are the most liable to be faulty of any other; but this refers more to proper speaking, than knowing right.

§ 6. *Ideas of substances, as referred to real essences, not adequate.*—*Thirdly*, What ideas we have of substances, I have above shewn; now, those ideas have in the mind a double reference: 1. Sometimes they are referred to a supposed real essence of each species of things. 2. Sometimes they are only designed to be pictures and representations in the mind of things that do exist by ideas of those qualities that are discoverable in them. In both which ways, these copies of those originals and archetypes, are imperfect and inadequate.

First, It is usual for men to make the names of substances stand for things, as supposed to have certain real essences, whereby they are of this or that species; and names standing for nothing but the ideas that are in men's minds, they must consequently refer their ideas to such real essences, as to their archetypes. That men (especially such as have been bred up in the learning taught in this part of the world) do suppose certain specific essences of substances, which each individual, in its several kinds, is made conformable to, and partakes of, is so far from needing proof, that it will be thought strange if any one should do otherwise. And thus they ordinarily apply the specific name they rank particular substances under, to things, as distinguished by such specific real essences. Who is there almost, who would not take it amiss, if it should be doubted, whether he called himself a man, with any other meaning than as having the real essence of a man? And yet if you demand, what those real essences are, it is plain men are ignorant, and know them not. From whence it follows, that the ideas they have in their minds, being referred to real essences, as to archetypes which are unknown, must be so far from being adequate, that they cannot be sup-

posed to be any representation of them at all. The complex ideas we have of substances, are, as it has been shewn, certain collections of simple ideas that have been observed or supposed constantly to exist together. But such a complex idea cannot be the real essence of any substance; for then the properties we discover in that body, would depend on that complex idea, and be deducible from it, and their necessary connexion with it be known; as all properties of a triangle depend on, and as far as they are discoverable, are deducible from, the complex idea of three lines, including a space. But it is plain, that in our complex ideas of substances, are not contained such ideas, on which all the other qualities, that are to be found in them, do depend. The common idea men have of iron, is a body of a certain colour, weight, and hardness; and a property that they look on as belonging to it, is malleableness. But yet this property has no necessary connexion with that complex idea, or any part of it; and there is no more reason to think, that malleableness depends on that colour, weight, and hardness, than that that colour, or that weight, depends on its malleableness. And yet, though we know nothing of these real essences, there is nothing more ordinary, than that men should attribute the sorts of things to such essences. The particular parcel of matter, which makes the ring I have on my finger, is forwardly, by most men, supposed to have a real essence, whereby it is gold; and from whence those qualities flow, which I find in it, viz., its peculiar colour, weight, hardness, fusibility, fixedness, and change of colour upon a slight touch of mercury, &c. This essence, from which all these properties flow, when I inquire into it, and search after it, I plainly perceive I cannot discover; the farthest I can go, is only to presume, that it being nothing but body, its real essence, or internal constitution, on which these qualities depend, can be nothing but the figure, size, and connexion of its solid parts; of neither of which, having any distinct perception at all, I can have no idea of its essence, which is the cause that it has that particular shining yellowness, a greater weight than any thing I know of the same bulk, and a fitness to have its colour changed by the touch of quicksilver. If any one will say, that the real essence, and internal constitution, on which these properties depend, is not the figure, size, and arrangement or connexion of its solid parts, but something else, called its particular form; I am farther from having any idea of its real essence, than I was before; for I have an idea of figure, size, and situation of solid parts in general, though I have none of the particular figure, size, or putting together of parts, whereby the qualities above-mentioned are produced; which qualities I find in that particular parcel of matter that is on my finger, and not in another parcel of matter with which I cut the pen I write with. But when I am told, that something besides the figure, size, and posture of the solid parts of that body, is its essence, something called substantial form; of that, I confess, I have no idea at all, but only of the sound form; which is far enough from an idea of its real essence, or constitution. The like ignorance as I have of the real essence of this particular substance, I have also of the real essence of all other natural ones; of which essences, I confess, I have no distinct ideas at all; and I am apt to suppose others, when they examine their

own knowledge, will find in themselves, in this one point, the same sort of ignorance.

§ 7. Now then, when men apply this particular parcel of matter on my finger, a general name already in use, and denominated gold, do they not ordinarily, or are they not understood to, give it that name as belonging to a particular species of bodies, having a real internal essence; by having of which essence, this particular substance comes to be of that species, and to be called by that name? If it be so, as it is plain it is, the name by which things are marked, as having that essence, must be referred primarily to that essence; and consequently the idea to which that name is given, must be referred also to that essence, and be intended to represent it. Which essence, since they, who so use the names, know not their ideas of substances, must be all inadequate in that respect, as not containing in them that real essence which the mind intends they should.

§ 8. *Ideas of substances, as collections of their qualities, are all inadequate.*—*Secondly,* Those who neglecting that useless supposition of unknown real essences, whereby they are distinguished, endeavour to copy the substances that exist in the world, by putting together the ideas of those sensible qualities which are found co-existing in them, though they come much nearer a likeness of them, than those who imagine they know not what real specific essences; yet they arrive not at perfectly adequate ideas of those substances they would thus copy into their minds; nor do those copies exactly and fully contain all that is to be found in their archetypes. Because those qualities, and powers of substance, whereof we make their complex ideas, are so many and various, that no man's complex idea contains them all. That our abstract ideas of substances, do not contain in them all the simple ideas that are united in the things themselves, it is evident, in that men do rarely put into their complex idea of any substance, all the simple ideas they do know to exist in it. Because endeavouring to make the signification of their names as clear, and as little cumbersome, as they can, they make their specific ideas of the sorts of substances, for the most part, of a few of those simple ideas which are to be found in them: but these having no original precedency, or right to be put in, and make the specific idea more than others that are left out, it is plain; that both these ways, our ideas of substances are deficient and inadequate. The simple ideas whereof we make our complex ones of substances, are all of them (bating only the figure and bulk of some sorts) powers, which being relations to other substances, we can never be sure that we know all the powers that are in any one body, till we have tried what changes it is fitted to give to, or receive from, other substances, in their several ways of application: which being impossible to be tried upon any one body, much less upon all, it is impossible we should have adequate ideas of any substance made up of a collection of all its properties.

§ 9. Whosoever first lighted on a parcel of that sort of substance we denote by the word gold, could not rationally take the bulk and figure he observed in that lump, to depend on its real essence or internal constitution. Therefore those never went into his idea of that species of

body; but its peculiar colour, perhaps, and weight, were the first he abstracted from it, to make the complex idea of that species. Which both are but powers; the one to affect our eyes after such a manner, and to produce in us that idea we call yellow; and the other, to force upwards any other body of equal bulk, they being put into a pair of equal scales, one against another. Another, perhaps, added to these, the ideas of fusibility and fixedness, two other passive powers, in relation to the operation of fire upon it; another, its ductility and solubility in *aqua regia*; two other powers, relating to the operation of other bodies, in changing its outward figure or separation of it into insensible parts. These, or part of these, put together, usually make the complex idea in men's minds, of that sort of body we call gold.

§ 10. But no one, who hath considered the properties of bodies in general, or this sort in particular, can doubt, that this called gold, has infinite other properties, not contained in that complex idea. Some, who have examined this species more accurately, could, I believe, enumerate ten times as many properties in gold, all of them as inseparable from its internal constitution, as its colour, or weight; and, it is probable, if any one knew all the properties that are by divers men known of this metal, there would be a hundred times as many ideas go to the complex idea of gold, as any one man yet has in his; and yet, perhaps, that not be the thousandth part of what is to be discovered in it. The changes which that one body is apt to receive, and make in other bodies, upon due application, exceeding far, not only what we know, but what we are apt to imagine. Which will not appear so much a paradox, to any one who will but consider how far men are yet from knowing all the properties of that one, no very compound figure, a triangle, though it be no small number that are already by mathematicians discovered of it.

§ 11. *Ideas of substances, as collections of their qualities, are all inadequate.*—So that all our complex ideas of substances, are imperfect and inadequate. Which would be so also in mathematical figures, if we were to have our complex ideas of them only by collecting their properties in reference to other figures. How uncertain and imperfect would our ideas be of an ellipsis, if we had no other idea of it, but some few of its properties? Whereas having in our plain idea, the whole essence of that figure, we from thence discover those properties, and demonstratively see how they flow, and are inseparable from it.

§ 12. *Simple ideas, εικονα, and adequate.*—This in the mind has three sorts of abstract ideas, or nominal essences:

First, Simple ideas, which are εικονα, or copies; but yet certainly adequate. Because being intended to express nothing but the power in things to produce in the mind such a sensation, that sensation when it is produced, cannot but be the effect of that power. So the paper I write on, having the power, in the light (I speak according to the common notion of light), to produce in men the sensation which I call white, it cannot but be the effect of such a power in something without the mind; since the mind has not the power to produce any idea in itself, and being meant for nothing else but the effect of such a power, that simple idea is real and adequate; the sensation of white, in my

mind, being the effect of that power, which is in the paper to produce it, it is perfectly adequate to that power; or else, that power would produce a different idea.

§ 13. *Ideas of substances are εικτυπα, inadequate.*—*Secondly*, The complex ideas of substances, are ectypes, copies too; but not perfect ones, not adequate: which is very evident to the mind, in that it plainly perceives, that whatever collection of simple ideas it makes of any substance that exists, it cannot be sure, that it exactly answers all that are in that substance: since not having tried all the operations of all other substances upon it, and found all the alterations it would receive from, or cause in, other substances, it cannot have an exact adequate collection of all its active and passive capacities; and so not have an adequate complex idea of the powers of any substance existing, and its relations, which is that sort of complex ideas of substances we have. And, after all, if we would have, and actually had, in our complex idea, an exact collection of all the secondary qualities or powers of any substance, we should not yet thereby have an idea of the essence of that thing. For since the powers or qualities, that are observable by us, are not the real essence of that substance, but depend on it, and flow from it, any collection whatsoever of these qualities, cannot be the real essence of that thing. Whereby it is plain, that our ideas of substances are not adequate; are not what the mind intends them to be. Besides, a man has no idea of substance in general, nor knows what substance is in itself.

§ 14. *Ideas of modes and relations, are archetypes, and cannot but be adequate.*—*Thirdly*, Complex ideas of modes and relations, are originals and archetypes; are not copies nor made after the pattern of any real existence, to which the mind intends them to be conformable, and exactly to answer. These being such collections of simple ideas, that the mind itself puts together, and such collections, that each of them contains in it precisely all that the mind intends that it should, they are archetypes and essences of modes that may exist; and so are designed only for, and belong only to, such modes, as when they do exist, have an exact conformity with those complex ideas. The ideas therefore of modes and relations, cannot but be adequate.

CHAP. XXXII.

OF TRUE AND FALSE IDEAS.

§ 1. *Truth and falsehood properly belong to propositions.*—Though truth and falsehood belong, in propriety of speech, only to propositions yet ideas are oftentimes termed true or false (as what words are there that are not used with great latitude, and with some deviation from their strict and proper significations?). Though, I think, that when ideas themselves are termed true or false, there is still some secret or tacit proposition, which is the foundation of that denomination; as we shall see, if we examine the particular occasions wherein they come to be called true or false. In all which, we shall find some kind of affirmations

tion, or negation, which is the reason of that denomination. For our ideas being nothing but bare appearances or perceptions in our minds, cannot properly and simply in themselves be said to be true or false, no more than a single name of any thing can be said to be true or false.

§ 2. *Metaphysical truth contains a tacit proposition.*—Indeed, both ideas and words may be said to be true in a metaphysical sense of the word truth, as all other things, that any way exist, are said to be true; i. e. really to be such as they exist. Though in things called true, even in that sense, there is, perhaps, a secret reference to our ideas, looked upon as the standards of that truth, which amounts to a mental proposition, though it be usually not taken notice of.

§ 3. *No idea, as an appearance in the mind, true or false.*—But it is not in that metaphysical sense of truth which we inquire here, when we examine whether our ideas are capable of being true or false; but in the more ordinary acceptation of those words: and so I say, that the ideas in our minds, being only so many perceptions, or appearances there, none of them are false. The idea of a centaur having no more falsehood in it, when it appears in our minds, than the name centaur has falsehood in it, when it is pronounced by our mouths, or written on paper. For truth or falsehood lying always in some affirmation or negation, mental or verbal, our ideas are not capable, any of them, of being false, till the mind passes some judgment on them; that is, affirms or denies something of them.

§ 4. *Ideas, referred to any thing, may be true or false.*—Whenever the mind refers any of its ideas to any thing extraneous to them, they are then capable to be called true or false. Because the mind in such a reference, makes a tacit supposition of their conformity to that thing: which supposition, as it happens to be true or false; so the ideas themselves come to be denominated. The most usual cases wherein this happens, are these following:

§ 5. *Other men's ideas, real existence, and supposed real essences, are what men usually refer their ideas to.*—*First*, When the mind supposes any idea it has in itself, to be conformable to that in other men's minds, called by the same common name; v. g. when the mind intends or judges its ideas of justice, temperance, religion, to be the same with what other men give those names to.

Secondly, When the mind supposes any idea it has in itself, to be conformable to some real existence. Thus the two ideas of a man and a centaur, supposed to be the ideas of real substances, are the one true, and the other false; the one having a conformity to what has really existed, the other not.

Thirdly, When the mind refers any of its ideas to that real constitution and essence of any thing, whereon all its properties depend: and thus the greatest part, if not all our ideas of substances, are false.

§ 6. *The cause of such references.*—These suppositions the mind is very apt tacitly to make concerning its own ideas: but yet if we will examine it, we shall find it is chiefly, if not only, concerning its abstract complex ideas. For the natural tendency of the mind being towards knowledge; and finding that, if it should proceed by, and dwell upon,

only particular things, its progress would be very slow, and its work endless: therefore, to shorten its way to knowledge, and make each perception the more comprehensive, the first thing it does, as the foundation of the easier enlarging its knowledge, either by contemplation of the things themselves that it would know, or conference with others about them, is to bind them into bundles, and rank them so into sorts, that what knowledge it gets of any of them, it may thereby with assurance extend to all of that sort; and so advance by larger steps in that, which is its great business, knowledge. This, as I have elsewhere shewn, is the reason why we collect things under comprehensive ideas, with names annexed to them, into genera and species, i. e. into kinds and sorts.

§ 7. If, therefore, we will warily attend to the motions of the mind, and observe what course it usually takes in its way to knowledge, we shall, I think, find, that the mind having got an idea, which it thinks it may have use of, either in contemplation or discourse, the first thing it does, is to abstract it, and then get a name to it: and so lay it up in its store-house, the memory, as containing the essence of a sort of things, of which that name is always to be the mark. Hence it is, that we may often observe, that when any one sees a new thing of a kind that he knows not, he presently asks what it is, meaning by that inquiry, nothing but the name. As if the name carried with it the knowledge of the species, or the essence of it, whereof it is indeed used as the mark, and is generally supposed annexed to it.

§ 8. *The cause of such references.*—But this abstract idea being something in the mind between the thing that exists, and the name that is given to it; it is in our ideas, that both the rightness of our knowledge, and the propriety or intelligibleness of our speaking, consists. And hence it is, that men are so forward to suppose that the abstract ideas they have in their minds, are such as agree to the things existing without them, to which they are referred; and are the same, also, to which the names they give them, do, by the use and propriety of the language, belong. For without this double conformity of their ideas they find they should both think amiss of things in themselves, and talk of them unintelligibly to others.

§ 9. *Simple ideas may be false, in reference to others of the same name, but are least liable to be so.*—*First,* Then, I say, that when the truth of our ideas is judged of by the conformity they have to the idea which other men have, and commonly signify by the same name, they may be any of them false. But yet simple ideas are least of all liable to be so mistaken: because a man by his senses, and every day's observation, may easily satisfy himself what the simple ideas are, which their several names that are in common use stand for, they being but few in number, and such, as if he doubts or mistakes in, he may easily rectify by the objects they are to be found in. Therefore, it is seldom that any one mistakes in his names of simple ideas; or applies the name red, to the idea of green; or the name sweet, to the idea bitter: much less are men apt to confound the names of ideas belonging to different senses; and call a colour by the name of a taste, &c., where it is evident, that the simple ideas they call by any name, are con-

monly the same that others have and mean, when they use the same names.

§ 10. *Ideas of mixed modes most liable to be false in this sense.*—Complex ideas are much more liable to be false in this respect; and the complex ideas of mixed modes, much more than those of substances: because in substances (especially those which the common and unborrowed names of any language are applied to), some remarkable sensible qualities, serving ordinarily to distinguish one sort from another, easily preserve those, who take any care in the use of their words, from applying them to sorts of substances to which they do not at all belong. But in mixed modes, we are much more uncertain, it being not so easy to determine of several actions, whether they are to be called justice or cruelty; liberality or prodigality. And so in referring our ideas to those of other men, called by the same names, ours may be false; and the idea in our minds, which we express by the word justice, may, perhaps, be that which ought to have another name.

§ 11. *Or at least to be thought false.*—But whether or no our ideas of mixed modes are more liable than any sort, to be different from those of other men, which are marked by the same names: this at least is certain, that this sort of falsehood is much more familiarly attributed to our ideas of mixed modes, than to any other, when a man is thought to have a false idea of justice, or gratitude, or glory, it is for no other reason, but that his agrees not with the ideas which each of those names are the signs of in other men.

§ 12. *And why.*—The reason whereof seems to me to be this, that the abstract ideas of mixed modes, being men's voluntary combinations of such a precise collection of simple ideas; and so the essence of each species being made by men alone, whereof we have no other sensible standard existing any where: but the name itself, or the definition of that name: we have nothing else to refer these our ideas of mixed modes to, as a standard to which we would conform them, but the ideas of those who are thought to use those names in their most proper significations; and so, as our ideas conform, or differ from them, they pass for true or false. And thus much concerning the truth and falsehood of our ideas in reference to their names.

§ 13. *As referred to real existences, none of our ideas can be false, but those of substances.*—Secondly, As to the truth and falsehood of our ideas, in reference to the real existence of things, when that is made the standard of their truth, none of them can be termed false, but only complex ideas of substances.

§ 14. *First, simple ideas in this sense not false, and why.*—First, Our simple ideas being barely such perceptions as God has fitted us to receive, and given power to external objects to produce in us by established laws and ways, suitable to his wisdom and goodness, though incomprehensible to us, their truth consists in nothing else but in such appearances as are produced in us, and must be suitable to those powers he has placed in external objects, or else they could not be produced in us: and thus answering those powers, they are what they should be, true ideas. Nor do they become liable to any imputation of falsehood, if the mind (as in most men I believe it does) judges these ideas to be

in the things themselves. For God in his wisdom, having set them as marks of distinction in things, whereby we may be able to discern one thing from another, and so choose any of them for our uses, as we have occasion, it alters not the nature of our simple idea, whether we think, that the idea of blue be in the violet itself, or in our mind only; and only the power of producing it by the texture of its parts, reflecting the particles of light, after a certain manner, to be in the violet itself. For that texture in the object, by a regular and constant operation, producing the same idea of blue in us, it serves us to distinguish, by our eyes, that from any other thing, whether that distinguishing mark, as it is really in the violet, be only a peculiar texture of parts, or else that very colour, the idea whereof (which is in us) is the exact resemblance. And it is equally from that appearance to be denominated blue, whether it be that real colour, or only a peculiar texture in it, that causes in us that idea: since the name blue notes properly nothing but that mark of distinction that is in a violet, discernible only by our eyes, whatever it consists in, that being beyond our capacities distinctly to know, and, perhaps, would be of less use to us, if we had faculties to discern.

§ 15. *Though one man's idea of blue should be different from another's.*—Neither would it carry any imputation of falsehood to our simple ideas, if by the different structure of our organs, it were so ordered, that the same object should produce in several men's minds different ideas at the same time; v. g. if the idea that a violet produced in one man's mind by his eyes, were the same that a marigold produced in another man's, and *vice versa*. For since this could never be known, because one man's mind could not pass into another man's body, to perceive what appearances were produced by those organs; neither the ideas hereby, nor the names, would be at all confounded, or any falsehood be in either. For all things that had the texture of a violet, producing constantly the idea that he called blue; and those which had the texture of a marigold, producing constantly the idea which he has constantly called yellow, whatsoever those appearances were in his mind, he would be able as regularly to distinguish things for his use by those appearances, and understand and signify those distinctions, marked by the names blue and yellow, as if the appearances, or ideas in his mind, received from those two flowers, were exactly the same with the ideas in other men's minds. I am nevertheless very apt to think, that the sensible ideas produced by any object in different men's minds, are most commonly very near and undiscernibly alike. For which opinion, I think, there might be many reasons offered: but that being besides my present business, I shall not trouble my reader with them: but only mind him, that the contrary supposition, if it could be proved, is of little use, either for the improvement of our knowledge, or convenience of life; and so we need not trouble ourselves to examine it.

§ 16. *First, simple ideas in this sense not false, and why.*—From what has been said concerning our simple ideas, I think it evident, that our simple ideas can none of them be false, in respect of things existing without us. For the truth of these appearances, or perceptions in our minds, consisting, as has been said, only in their being answerable to the powers in external objects, to produce by our senses such ap-

pearances in us, and each of them being in the mind, such as it is suitable to the power that produced it, and which alone it represents, it cannot, upon that account, or as referred to such a pattern, be false. Blue or yellow, bitter or sweet, can never be false ideas; these perceptions in the mind are just such as they are there, answering the powers appointed by God to produce them; and so are truly what they are, and intended to be. Indeed the names may be misapplied; but that in this respect, makes no falsehood in the ideas: as if a man ignorant in the English tongue, should call purple, scarlet.

§ 17. *Secondly, modes not false.*—*Secondly*, Neither can our complex ideas of modes, in reference to the essence of any thing really existing, be false. Because whatever complex idea I have of any mode, it hath no reference to any pattern existing, and made by nature; it is not supposed to contain in it any other ideas than what it hath; nor to represent any thing, but such a complication of ideas as it does. Thus, when I have the idea of such an action of a man, who forbears to afford himself such meat, drink, and clothing, and other necessaries of life, as his riches and estate will be sufficient to supply, and his station requires, I have no false idea; but such a one as represents an action, either as I find or imagine it; and so is capable of neither truth or falsehood. But when I give the name of frugality, or virtue, to this action, then it may be called a false idea, if thereby it be supposed to agree with that idea, to which, in propriety of speech, the name of frugality doth belong; or to be conformable to that law, which is the standard of virtue and vice.

§ 18. *Thirdly, ideas of substances, when false.*—*Thirdly*, Our complex ideas of substances, being all referred to patterns in things themselves, may be false. That they are all false, when looked upon as the representations of the unknown essences of things, is so evident, that there needs nothing to be said of it. I shall, therefore, pass over that chimerical supposition, and consider them as collections of simple ideas in the mind, taken from combinations of simple ideas existing together constantly in things, of which patterns they are the supposed copies: and in this reference of them, to the existence of things, they are false ideas. 1. When they put together simple ideas, which in the real existence of things have no union; as when to the shape and size that exist together in a horse, is joined in the same complex idea, the power of barking like a dog: which three ideas, however put together into one in the mind, were never united in nature; and this, therefore, may be called a false idea of a horse. 2. Ideas of substances are, in this respect, also false, when from any collection of simple ideas that do always exist together, there is separated, by a direct negation, any other simple idea which is constantly joined with them. Thus, if to extension, solidity, fusibility, the peculiar weightiness, and yellow colour of gold, any one join in his thoughts the negation of a greater degree of fixedness than is in lead or copper, he may be said to have a false complex idea; as well as when he joins to those other simple ones, the idea of a perfect absolute fixedness. For either way, the complex idea of gold being made up of such simple ones as have no union in nature, may be termed false. But if we leave out of this his complex idea,

that of fixedness, quite, without either actually joining to, or separating of it from, the rest in his mind, it is, I think, to be looked on as an inadequate and imperfect idea, rather than a false one; since though it contains not all the simple ideas that are united in nature, yet it puts none together but what do really exist together.

§ 19. *Truth and falsehood always supposes affirmation or negation.*—Though in compliance with the ordinary way of speaking, I have shewn in what sense, and upon what ground, our ideas may be sometimes called true, or false; yet if we will look a little nearer into the matter in all cases, where any idea is called true, or false, it is from some judgment that the mind makes, or is supposed to make, that is true or false. For truth or falsehood, being never without some affirmation or negation, express or tacit, it is not to be found, but where signs are joined or separated, according to the agreement or disagreement of the things they stand for. The signs we chiefly use, are either ideas, or words, wherewith we make either mental or verbal propositions. Truth lies in so joining or separating these representatives, as the things they stand for do in themselves agree or disagree; and falsehood in the contrary, as shall be more fully shewn hereafter.

§ 20. *Ideas in themselves neither true nor false.*—Any idea then which we have in our minds, whether conformable or not to the existence of things, or to any idea in the minds of other men, cannot properly for this alone be called false. For these representations, if they have nothing in them but what is really existing in things without, cannot be thought false, being exact representations of something: nor yet, if they have any thing in them, differing from the reality of things, can they properly be said to be false representations, or ideas, of things they do not represent. But the mistake and falsehood is,

§ 21. *But are false, first, when judged agreeable to another man's idea without being so.*—*First*, When the mind having any idea, it judges and concludes it the same that is in other men's minds, signified by the same name; or that it is conformable to the ordinary received signification or definition of that word, when indeed it is not: which is the most usual mistake in mixed modes, though other ideas also are liable to it.

§ 22. *Secondly, when judged to agree to real existence, when they do not.*—*Secondly*, When it having a complex idea made up of such a collection of simple ones, as nature never puts together, it judges it to agree to a species of creatures really existing; as when it joins the weight of tin to the colour, fusibility, and fixedness of gold.

§ 23. *Thirdly, when judged adequate without being so.*—*Thirdly*, When in its complex idea, it has united a certain number of simple ideas, that do really exist together in some sort of creatures, but has also left out others, as much inseparable, it judges this to be a perfect complete idea of a sort of things which really it is not; v. g. having joined the idea of substance, yellow, malleable, most heavy, and fusible, it takes that complex idea to be the complete idea of gold, when yet its peculiar fixedness and solubility in *aqua regia*, are as inseparable from those other ideas or qualities of that body, as they are one from another.

§ 24. *Fourthly, when judged to represent the real essence.*—

Fourthly, The mistake is yet greater, when I judge, that this complex idea contains in it the real essence of any body existing; when at least it contains but some few of those properties which flow from its real essence and constitution, I say, only some few of those properties; for those properties consisting mostly in the active and passive powers it has, in reference to other things, all that are vulgarly known of any one body, and of which the complex idea of that kind of things is usually made, are but a very few, in comparison of what a man, that has several ways tried and examined it, knows of that one sort of things; and all that the most expert man knows, are but a few, in comparison of what are really in that body, and depend on its internal or essential constitution. The essence of a triangle, lies in a very little compass, consists in a very few ideas; three lines including a space, make up that essence: but the properties that flow from this essence, are more than can be easily known or enumerated. So I imagine it is in substances, their real essences lie in a little compass; though the properties flowing from that internal constitution, are endless.

§ 25. *Ideas, when false.*—To conclude, a man having no notion of any thing without him, but by the idea he has of it in his mind (which idea he has a power to call by what name he pleases), he may, indeed, make an idea neither answering the reality of things, nor agreeing to the ideas commonly signified by other people's words; but cannot make a wrong or false idea of a thing, which is no otherwise known to him, but by the idea he has of it: v. g. when I frame an idea of the legs, arms, and body of a man, and join to this a horse's head and neck, I do not make a false idea of any thing; because it represents nothing without me. But when I call it a man, or Tartar, and imagine it to represent some real being without me, or to be the same idea that others call by the same name, in either of these cases, I may err. And upon this account it is, that it comes to be termed a false idea; though, indeed, the falsehood lies not in the idea, but in that fictitious mental proposition, wherein a conformity and resemblance is attributed to it, which it has not. But yet, if having framed such an idea in my mind, without thinking either that existence, or the name of man or Tartar, belongs to it, I will call it a man or Tartar, I may be justly thought fantastical in the naming; but not erroneous in my judgment; nor the idea any way false.

§ 26. *More properly to be called right or wrong.*—Upon the whole matter, I think, that our ideas, as they are considered by the mind, whether in reference to the proper signification of their names, or in reference to the reality of things, may very fitly be called right or wrong ideas, according as they agree or disagree to those patterns to which they are referred. But if any one had rather call them true, or false, it will not unfit he use a liberty, which every one has, to call things by those names he thinks best; though in propriety of speech, truth or falsehood, will, I think, scarce agree to them, but as they, some way or other, virtually contain in them some mental proposition. The ideas that are in a man's mind, simply considered, cannot be wrong unless complex ones, wherein inconsistent parts are jumbled together. All our ideas are in

themselves right; and the knowledge about them, right and true knowledge: but when we come to refer them to any thing, as to their patterns and archetypes, then they are capable of being wrong, as far as they disagree with such archetypes.

CHAP. XXXIII.

OF THE ASSOCIATION OF IDEAS.

§ 1. *Something unreasonable in most men.*—There is scarce any one that does not observe something that seems odd to him, and is in itself really extravagant in the opinions, reasonings, and actions of other men. The least flaw of this kind, if at all different from his own, every one is quick-sighted enough to espy in another, and will, by the authority of reason, forwardly condemn, though he be guilty of much greater unreasonableness in his own tenets and conduct, which he never perceives, and will very hardly, if at all, be convinced of.

§ 2. *Not wholly from self-love.*—This proceeds not wholly from self-love, though that has often a great hand in it. Men of fair minds, and not given up to the overweening of self-flattery, are frequently guilty of it; and in many cases one with amazement hears the arguings, and is astonished at the obstinacy, of a worthy man, who yields not to the evidence of reason, though laid before him as clear as daylight.

§ 3. *Not from education.*—This sort of unreasonableness is usually imputed to education and prejudice, and for the most part truly enough, though that reaches not to the bottom of the disease, nor shews distinctly enough whence it rises, or wherein it lies. Education is often rightly assigned for the cause, and prejudice is a good general name for the thing itself: but yet, I think, he ought to look a little farther, who would trace this sort of madness to the root it springs from, and so explain it, as to shew whence this flaw has its original in very sober and rational minds, and wherein it consists.

§ 4. *A degree of madness.*—I shall be pardoned for calling it by so harsh a name as madness, when it is considered, that opposition to reason deserves that name, and is really madness; and there is scarce a man so free from it, but that, if he should always, on all occasions, argue or do as in some cases he constantly does, would not be thought fitter for bedlam, than civil conversation. I do not here mean when he is under the power of an unruly passion, but in the steady calm course of his life. That which will yet more apologize for this harsh name and ungrateful imputation on the greatest part of mankind, is, the inquiring a little by-the-by into the nature of madness, b. 2. c. 11. § 13. I found it to spring from the very same root, and to depend on the very same cause, we are here speaking of. This consideration of the thing itself at a time when I thought not the least on the subject which I am now treating of, suggested it to me. And, if this be a weakness to which all men are so liable; if this be a taint which so universall infects mankind, the greater care should be taken to lay it open under its due name, thereby to excite the greater care in its prevention and cure.

§ 5. *From a wrong connexion of ideas.*—Some of our ideas have a natural correspondence and connexion one with another: it is the office and excellency of our reason to trace these, and hold them together in that union and correspondence which is founded in their peculiar beings. Besides this, there is another connexion of ideas wholly owing to chance or custom; ideas that in themselves are not at all of kin, come to be so united in some men's minds, that it is very hard to separate them; they always keep in company, and the one no sooner at any time comes into the understanding, but its associate appears with it; and if they are more than two, which are thus united, the whole gang, always inseparable, shew themselves together.

§ 6. *This connexion how made.*—This strong combination of ideas, not allayed by nature, the mind makes in itself either voluntarily, or by chance; and hence it comes in different men to be very different, according to their different inclinations, education, interests, &c. Custom settles habits of thinking in the understanding, as well as of determining in the will, and of motions in the body; all which seem to be but trains of motion in the animal spirits, which once set agoing, continue in the same steps they have been used to, which by often treading, are worn into a smooth path, and the motion in it becomes easy, and, as it were, natural. As far as we can comprehend thinking, thus ideas seem to be produced in our minds; or if they are not, this may serve to explain their following one another in an habitual train, when once they are put into their tract, as well as it does to explain such motions of the body. A musician used to any tune, will find, that let it but once begin in his head, the ideas of the several notes of it will follow one another orderly in his understanding, without any care or attention, as regularly as his fingers move orderly over the keys of the organ to play out the tune he has begun, though his unattentive thoughts be elsewhere a wandering. Whether the natural cause of these ideas, as well as of that regular dancing of his fingers, be the motion of his animal spirits, I will not determine, how probable soever by this instance it appears to be so, but this may help us a little to conceive of intellectual habits, and of the tying together of ideas.

§ 7. *Some antipathies an effect of it.*—That there are such associations of them made by custom in the minds of most men, I think nobody will question, who has well considered himself or others; and to this, perhaps, might be justly attributed most of the sympathies and antipathies observable in men, which work as strongly, and produce as regular effects, as if they were natural, and are, therefore, called so, though they, at first, had no other original, but the accidental connexion of two ideas, which either the strength of the first impression, or future indulgence, so united, that they always afterward keep company together in that man's mind, as if they were but one idea. I say, most of the antipathies, I do not say all, for some of them are truly natural, depend upon our original constitution, and are born with us; but a great part of those which are counted natural, would have been known to be from unheeded, though, perhaps, early impressions, or wanton fancies at first, which would have been acknowledged the original of them, if they had been warily observed. A grown person surfeiting

with honey, no sooner hears the name of it, but his fancy immediately carries sickness and qualms to his stomach, and he cannot bear the very idea of it; other ideas of dislike, and sickness, and vomiting, presently accompany it, and he is disturbed, but he knows from whence to date this weakness, and can tell how he got this indisposition; had this happened to him by an over-dose of honey, when a child, all the same effects would have followed, but the cause would have been mistaken, and the antipathy counted natural.

§ 8. I mention this, not out of any great necessity there is in this present argument, to distinguish nicely between natural and acquired antipathies, but I take notice of it for another purpose, viz. that those who have children, or the charge of their education, would think it worth their while, diligently to watch, and carefully to prevent, the undue connexion of ideas in the minds of young people. This is the time most susceptible of lasting impressions; and though those relating to the health of the body, are, by discreet people, minded and fenced against; yet I am apt to doubt, that those which relate more peculiarly to the mind, and terminate in the understanding, or passions, have been much less heeded than the thing deserves; nay, those relating purely to the understanding, have, as I suspect, been, by most men, wholly overlooked.

§ 9. *A great cause of errors.*—This wrong connexion in our minds of ideas, in themselves loose and independent one of another, has such an influence, and is of so great force to set us awry in our actions, as well moral as natural passions, reasonings, and notions themselves; that, perhaps, there is not any one thing that deserves more to be looked after.

§ 10. *Instances.*—The ideas of goblins and sprights, have really no more to do with darkness than light; yet let but a foolish maid inculcate these often on the mind of a child, and raise them there together, possibly he shall never be able to separate them again so long as he lives; but darkness shall ever afterward bring with it those frightful ideas, and they shall be so joined, that he can no more bear the one than the other.

§ 11. A man receives a sensible injury from another, thinks on the man and that action over and over, and by ruminating on them strongly or much in his mind, so cements those two ideas together, that he makes them almost one; never thinks on the man, but the pain and displeasure he suffered, comes into his mind with it, so that he scarce distinguishes them, but has as much aversion for the one as the other. Thus hatreds are often begotten from slight and innocent occasions, and quarrels propagated and continued in the world.

§ 12. A man has suffered pain or sickness in any place; he saw his friend die in such a room; though these have in nature nothing to do with one another, yet when the idea of the place occurs to his mind, it brings (the impression being once made) that of the pain and displeasure with it, he confounds them in his mind, and can as little bear the one as the other.

§ 13. *Why time cures some disorders in the mind, which reason cannot.*—When this combination is settled, and whilst it lasts, it is not the power of reason to help us, and relieve us from the effects of it.

Ideas in our minds, when they are there, will operate according to their natures and circumstances; and here we see the cause why time cures certain affections, which reason, though in the right, and allowed to be so, has not power over, nor is able against them to prevail with those who are apt to hearken to it in other cases. The death of a child, that was the daily delight of his mother's eyes, and joy of her soul, rends from her heart the whole comfort of her life, and gives her all the torment imaginable: use the consolations of reason in this case, and you were as good preach ease to one on the rack, and hope to allay, by rational discourses, the pain of his joints tearing asunder: till time has by disuse separated the sense of that enjoyment, and its loss from the idea of the child returning to her memory, all representations, though ever so reasonable, are in vain; and therefore some, in whom the union between these ideas is never dissolved, spend their lives in mourning, and carry an incurable sorrow to their graves.

§ 14. *Farther instances of the effect of the association of ideas.*—A friend of mine knew one perfectly cured of madness by a very harsh and offensive operation. The gentleman, who was thus recovered, with great sense of gratitude and acknowledgment, owned the cure all his life after, as the greatest obligation he could have received; but whatever gratitude and reason suggested to him, he could never bear the sight of the operator: that image brought back with it the idea of that agony which he suffered from his hands, which was too mighty and intolerable for him to endure.

§ 15. Many children imputing the pain they endured at school to books they were corrected for, so join those ideas together, that a book becomes their aversion, and they are never reconciled to the study and use of them all their lives after; and thus reading becomes a torment to them, which otherwise possibly they might have made the great pleasure of their lives. There are rooms convenient enough, that some men cannot study in; and fashions of vessels, which though ever so clean and commodious, they cannot drink out of, and that by reason of some accidental ideas which are annexed to them, and make them offensive; and who is there that hath not observed some man to flag at the appearance, or in the company, of some certain person not otherwise superior to him, but because having once on some occasion got the ascendant, the idea of authority and distance goes along with that of the person, and he that has been thus subjected, is not able to separate them.

§ 16. Instances of this kind are so plentiful every where, that if I add one more, it is only for the pleasant oddness of it. It is of a young gentleman, who having learned to dance, and that to great perfection, there happened to stand an old trunk in the room where he learned. The idea of this remarkable piece of household stuff, had so mixed itself with the turns and steps of all his dances, that though in that chamber he could dance excellently well, yet it was only whilst that trunk was there, nor could he perform well in any other place, unless that, or some such other, trunk, had its due position in the room. If this story shall be suspected to be dressed up with some comical circumstances, a little beyond precise nature; I answer for myself, that I

had it some years since from a very sober and worthy man, upon his own knowledge, as I report it; and I dare say, there are very few inquisitive persons, who read this, who have not met with accounts, if not examples, of this nature, that may parallel, or at least justify, this.

§ 17. *Its influence on intellectual habits.*—Intellectual habits and defects this way contracted, are not less frequent and powerful, though less observed. Let the ideas of being and matter, be strongly joined either by education or much thought, whilst these are still combined in the mind, what notions, what reasonings, will there be about separate spirits? let custom, from the very childhood, have joined figure and shape to the idea of God, and what absurdities will that mind be liable to, about the Deity?

Let the idea of infallibility be inseparably joined to any person, and these two constantly together possess the mind, and then one body, in two places at once, shall unexamined be swallowed for a certain truth, by an implicit faith, whenever that imagined infallible person dictates and demands assent without inquiry.

§ 18. *Observable in different sects.*—Some such wrong and unnatural combinations of ideas, will be found to establish the irreconcilable opposition between different sects of philosophy and religion; for we cannot imagine every one of their followers to impose wilfully on himself and knowingly refuse truth offered by plain reason. Interest, though it does a great deal in the case, yet cannot be thought to work whole societies of men to so universal a perverseness, as that every one of them, to a man, should knowingly maintain falsehood: some at least must be allowed to do what all pretend to, i. e. to pursue truth sincerely; and therefore there must be something that blinds their understandings, and makes them not see the falsehood of what they embrace for real truth. That which thus captivates their reason, and leads men of sincerity blindfold from common sense, will, when examined, be found to be what we are speaking of: some independent ideas, of no alliance to one another, are, by education, custom, and the constant din of their party, so coupled in their minds, that they always appear there together, and they can no more separate them in their thoughts, than if they were but one idea, and they operate as if they were so. This gives sense to jargon, demonstration to absurdities, and consistency to nonsense, and is the foundation of the greatest, I had almost said, of all the errors in the world; or if it does not reach so far, it is at least the most dangerous one, since so far as it obtains, it hinders men from seeing and examining. When two things in themselves disjoined, appear to the sight constantly united; if the eye sees these things riveted, which are loose, where will you begin to rectify the mistakes that follow in two ideas that they have been accustomed so to join in their minds, as to substitute one for the other, and, as I am apt to think, often without perceiving it themselves? This, whilst they are under the deceit of it, makes them incapable of conviction, and they applaud themselves as zealous champions for truth, when indeed they are contending for error; and the confusion of two different ideas, which a customary connexion of them in their minds hath to them made in effect but one, fills their head with false views, and their reasonings with false consequences.

§ 19. *Conclusion.*—Having thus given an account of the original, sorts, and extent of our ideas, with several other considerations, about these (I know not whether I may say) instruments, or materials, of our knowledge; the method I at first proposed to myself, would now require, that I should immediately proceed to shew, what use the understanding makes of them, and what knowledge we have by them. This was that, which, in the first general view I had of this subject, was all that I thought I should have to do: but upon a nearer approach, I find, that there is so close a connexion between ideas and words; and our abstract ideas, and general words, have so constant a relation one to another, that it is impossible to speak clearly and distinctly of our knowledge, which all consists in propositions, without considering, first, the nature, use, and signification of language; which therefore must be the business of the next book.

BOOK III. CHAP. I.

OF WORDS OR LANGUAGE IN GENERAL.

§ 1. *MAN fitted to form articulate sounds.*—God having designed man for a sociable creature, made him not only with an inclination, and under a necessity, to have fellowship with those of his own kind, but furnished him also with language, which was to be the great instrument, and common tie, of society. Man, therefore, had by nature his organs so fashioned, as to be fit to frame articulate sounds, which we call words. But this was not enough to produce language: for parrots, and several other birds, will be taught to make articulate sounds distinct enough, which yet, by no means, are capable of language.

§ 2. *To make them signs of ideas.*—Besides articulate sounds, therefore, it was farther necessary, that he should be able to use these sounds as signs of internal conceptions; and to make them stand as marks for the ideas within his own mind, whereby they might be made known to others, and the thoughts of men's minds be conveyed from one to another.

§ 3. *To make general signs.*—But neither was this sufficient to make words so useful as they ought to be. It is not enough for the perfection of language, that sounds can be made signs of ideas, unless those sounds can be so made use of, as to comprehend several particular things; for the multiplication of words would have perplexed their use, had every particular thing need of a distinct name to be signified by. To remedy this inconvenience, language had yet a farther improvement in the use of general terms, whereby one word was made to mark a multitude of particular existences; which advantageous use of sounds was obtained only by the difference of the ideas they were made signs of: those names becoming general, which are made to stand for general ideas; and those remaining particular, where the ideas they are used for are particular.

§ 4. Besides these names which stand for ideas, there be other words

which men make use of, not to signify any idea, but the want of absence of some ideas, simple or complex, or ideas together : such as are *nihil* in Latin, and in English, ignorance and barrenness. All which negative or privative words, cannot be said properly to belong to, or signify, no ideas ; for then they would be perfectly insignificant sounds ; but they relate to positive ideas, and signify their absence.

§ 5. *Words ultimately derived from such as signify sensible ideas.*—It may also lead us a little toward the original of all our notions and knowledge, if we remark, how great a dependence our words have on common sensible ideas ; and how those, which are made use of to stand for actions and notions quite removed from sense, have their rise from thence, and, from obvious sensible ideas, are transferred to more abstruse significations, and made to stand for ideas that come not under the cognizance of our senses : v. g. to imagine, apprehend, comprehend, adhere, conceive, instil, disgust, disturbance, tranquillity, &c. are all words taken from the operations of sensible things, and applied to certain modes of thinking. Spirit, in its primary signification, is breath ; angel, a messenger : and I doubt not, but if we could trace them to their sources, we should find, in all languages, the names which stand for things that fall not under our senses, to have had their first rise from sensible ideas. By which we may give some kind of guess, what kind of notions they were, and whence derived, which filled their minds, who were the first beginners of languages ; and how nature, even in the naming of things, unawares suggested to men the originals and principles of all their knowledge ; whilst, to give names, that might make known to others any operations they felt in themselves, or any other ideas that come not under their senses, they were fain to borrow words from ordinary known ideas of sensation, by that means to make others the more easily to conceive those operations they experimented in themselves, which made no outward sensible appearances : and then, when they had got known and agreed names, to signify those internal operations of their own minds, they were sufficiently furnished to make known by words, all their other ideas ; since they could consist of nothing, but either of outward sensible perceptions, or of the inward operations of their minds about them ; we having, as has been proved, no ideas at all, but what originally came either from sensible objects without, or what we feel within ourselves, from the inward workings of our own spirits, of which we are conscious to ourselves within.

§ 6. *Distribution.*—But to understand better the use and force of language, as subservient to instruction and knowledge, it will be convenient to consider,

First, To what it is that names, in the use of language, are immediately applied.

Secondly, Since all (except proper) names are general, and so stand not particularly for this or that single thing, but for sorts and ranks of things, it will be necessary to consider, in the next place, what the sorts and kinds, or if you rather like the Latin names, what the *species* and *genera*, of things are ; wherein they consist ; and how they come to be made. These being (as they ought) well looked into, we shall the better come to find the right use of words ; the natural advantages and

defects of language; and the remedies that ought to be used, to avoid the inconveniences of obscurity or uncertainty in the signification of words, without which, it is impossible to discourse with any clearness, or order, concerning knowledge; which being conversant about propositions, and those most commonly universal ones, has greater connexion with words, than, perhaps, is suspected.

These considerations, therefore, shall be the matter of the following chapters.

CHAP. II.

OF THE SIGNIFICATION OF WORDS.

§ 1. *Words are sensible signs, necessary for communication.*—Man, though he has great variety of thoughts, and such, from which others, as well as himself, might receive profit and delight; yet they are all within his own breast invisible, and hidden from others, nor can of themselves be made appear. The comfort and advantage of society, not being to be had without communication of thoughts, it was necessary, that man should find out some external sensible signs, whereby those invisible ideas, which his thoughts are made up of, might be made known to others. For this purpose, nothing was so fit, either for plenty, or quickness, as those articulate sounds, which, with so much ease and variety, he found himself able to make. Thus we may conceive how words, which were by nature so well adapted to that purpose, come to be made use of by men, as the signs of their ideas; not by any natural connexion that there is between particular articulate sounds and certain ideas, for then there would be but one language amongst all men; but by a voluntary imposition, whereby such a word is made arbitrarily the mark of such an idea. The use then of words, is to be sensible marks of ideas; and the ideas they stand for, are their proper and immediate signification.

§ 2. *Words are the sensible signs of his ideas who uses them.*—The use men have of these marks, being either to record their own thoughts for the assistance of their own memory; or, as it were, to bring out their ideas, and lay them before the view of others; words in their primary or immediate signification, stand for nothing, but the ideas in the mind of him that uses them, how imperfectly soever, or carelessly, those ideas are collected from things which they are supposed to represent. When a man speaks to another, it is that he may be understood; and the end of speech, is, that those sounds, as marks, may make known his ideas to the hearer. That then which words are the marks of, are the ideas of the speaker; nor can any one apply them, as marks, immediately to any thing else, but the ideas that he himself hath. For this would be to make them signs of his own conceptions, and yet apply them to other ideas; which would be to make them signs, and not signs of his ideas at the same time; and so, in effect, to have no signification at all. Words being voluntary signs, they cannot be voluntary signs imposed by him on things he knows not. That would be to make them signs of nothing, sounds without signification. A man cannot make his words

the signs either of qualities in things, or of conceptions in the mind of another, whereof he has none in his own. Until he has some ideas of his own, he cannot suppose them to correspond with the conceptions of another man; nor can he use any signs for them; for thus they would be the signs of he knows not what, which is, in truth, to be the signs of nothing. But when he represents to himself other men's ideas, by some of his own, if he consent to give them the same names that other men do, it is still to his own ideas; to ideas that he has, and not to ideas that he has not.

§ 3. This is so necessary in the use of language, that in this respect, the knowing and the ignorant, the learned and unlearned, use the words they speak (with any meaning) all alike. They, in every man's mouth, stand for the ideas he has, and which he would express by them. A child having taken notice of nothing in the metal he hears called gold, but the bright shining yellow colour, he applies the word gold only to his own idea of that colour, and nothing else; and therefore calls the same colour in a peacock's tail, gold. Another that hath better observed, adds to shining yellow, great weight; and then the sound gold, when he uses it, stands for a complex idea of a shining yellow and very weighty substance. Another adds to those qualities, fusibility; and then the word gold signifies to him a body, bright, yellow, fusible, and very heavy. Another adds malleability. Each of these uses equally the word gold when they have occasion to express the idea which they have applied it to; but it is evident, that each can apply it only to his own idea; nor can he make it stand as a sign of such a complex idea as he has not.

§ 4. *Words often secretly referred first to the ideas in other men's minds.*—But though words, as they are used by men, can properly and immediately signify nothing but the ideas that are in the mind of the speaker; yet they, in their thoughts, give them a secret reference to two other things.

First, They suppose their words to be marks of the ideas in the minds also of other men, with whom they communicate; for else they should talk in vain, and could not be understood, if the sounds they applied to one idea, were such as by the hearer were applied to another, which is to speak two languages. But in this, men stand not usually to examine, whether the idea they, and those they discourse with, have in their minds, be the same; but think it enough, that they use the word, as they imagine, in the common acceptation of that language; in which they suppose that the idea they make it a sign of, is precisely the same to which the understanding men of that country apply that name.

§ 5. *Secondly, to the reality of things.*—*Secondly,* Because men would not be thought to talk barely of their own imaginations, but of things as really they are; therefore they often suppose their words to stand also for the reality of things. But this relating more particularly to substances, and their names, as perhaps the former does to simple ideas and modes, we shall speak of these two different ways of applying words more at large, when we come to treat of the names of mixed modes, and substances, in particular; though give me leave here to say

that it is a perverting the use of words, and brings unavoidable obscurity and confusion into their signification, whenever we make them stand for any thing but those ideas we have in our own minds.

§ 6. *Words by use readily excite ideas.*—Concerning words also, it is farther to be considered: *First*, That they being immediately the signs of men's ideas; and, by that means, the instruments whereby men communicate their conceptions, and express to one another those thoughts and imaginations they have within their own breasts; there comes by constant use, to be such a connexion between certain sounds, and the ideas they stand for, that the names heard, almost as readily excite certain ideas, as if the objects themselves, which are apt to produce them, did actually affect the senses. Which is manifestly so in all obvious sensible qualities; and in all substances that frequently and familiarly occur to us.

§ 7. *Words often used without signification.*—*Secondly*, That though the proper and immediate signification of words, are ideas in the mind of the speaker; yet because, by familiar use from our cradles, we come to learn certain articulate sounds very perfectly and have them readily on our tongues, and always at hand in our memories; but yet are not always careful to examine, or settle their significations perfectly, it often happens that men even when they would apply themselves to an attentive consideration, do set their thoughts more on words, than things. Nay, because words are many of them learned before the ideas are known for which they stand; therefore some, not only children, but men, speak several words, no otherwise than parrots do, only because they have learned them, and have been accustomed to those sounds. But so far as words are of use and signification, so far is there a constant connexion between the sound and the idea; and a designation, that the one stands for the other; without which application of them, they are nothing but so much insignificant noise.

§ 8. *Their signification perfectly arbitrary.*—Words by long and familiar use, as has been said, come to excite in men certain ideas, so constantly and readily, that they are apt to suppose a natural connexion between them. But that they signify only men's peculiar ideas, and that by a perfect arbitrary imposition, is evident, in that they often fail to excite in others (even that use the same language) the same ideas we take them to be the signs of; and every man has so inviolable a liberty to make words stand for what ideas he pleases, that no one hath the power to make others have the same ideas in their minds, that he has, when they use the same words that he does. And therefore the great Augustus himself, in the possession of that power which ruled the world, acknowledged he could not make a new Latin word; which was as much as to say, that he could not arbitrarily appoint what idea any sound should be a sign of, in the mouths and common language of his subjects. It is true, common use, by a tacit consent, appropriates certain sounds to certain ideas in all languages, which so far limits the signification of that sound, that unless a man applies it to the same idea, he does not speak properly; and let me add, that unless a man's words excite the same ideas in the hearer which he makes them stand for in speaking, he does not speak intelligibly. But whatever be the conse-

quence of any man's using of words differently, either from their general meaning, or the particular sense of the person to whom he addresses them, this is certain, their signification, in his use of them, is limited to his ideas, and they can be signs of nothing else.

CHAP. III.

OF GENERAL TERMS.

§ 1. *The greatest part of words general.*—All things that exist being particulars, it may perhaps be thought reasonable that words, which ought to be conformed to things, should be so too. I mean in their signification: but yet we find the quite contrary. The far greatest part of words, that make all languages, are general terms; which has not been the effect of neglect, or chance, but of reason and necessity.

§ 2. *For every particular thing to have a name, is impossible.*—*First,* It is impossible that every particular thing should have a distinct peculiar name. For the signification and use of words, depending on that connexion which the mind makes between its ideas, and the sounds it uses as signs of them, it is necessary, in the application of names to things, that the mind should have distinct ideas of the things, and retain also the particular name that belongs to every one, with its peculiar appropriation to that idea. But it is beyond the power of human capacity to frame and retain distinct ideas of all the particular things we meet with; every bird and beast men saw, every tree and plant that affected the senses could not find a place in the most capacious understanding. If it be looked on as an instance of a prodigious memory, that some generals have been able to call every soldier in their army, by his proper name; we may easily find a reason why men have never attempted to give names to each sheep in their flock, or crow that flies over their heads; much less to call every leaf of plants, or grain of sand, that came in their way, by a peculiar name.

§ 3. *And useless.*—*Secondly,* If it were possible, it would yet be useless; because it would not serve to the chief end of language. Men would in vain heap up names of particular things, that would not serve them to communicate their thoughts. Men learn names, and use them in talk with others, only that they may be understood; which is then only done, when by use or consent, the sound I make by the organs of speech, excites in another man's mind, who hears it, the idea I apply to it in mine, when I speak it. This cannot be done by names, applied to particular things, whereof I alone having the ideas in my mind, the names of them could not be significant or intelligible to another, who was not acquainted with all those very particular things, which had fallen under my notice.

§ 4. *Thirdly,* But yet granting this also feasible (which I think is not), yet a distinct name for every particular thing would not be of any great use for the improvement of knowledge; which, though founded in particular things, enlarges itself by general views; to which things, reduced into sorts under general names, are properly subservient. These, with the names belonging to them, come within some compass, and do not multiply every moment, beyond what either the mind can

contain, or use requires. And, therefore, in these, men have for the most part stopped; but yet not so as to hinder themselves from distinguishing particular things by appropriated names, where convenience demands it. And, therefore, in their own species, which they have most to do with, and wherein they have often occasion to mention particular persons, they make use of proper names; and their distinct individuals have distinct denominations.

§ 5. *What things have proper names.*—Besides persons, countries also, cities, rivers, mountains, and other the like distinctions of place, have usually found peculiar names, and that for the same reason; they being such as men have often an occasion to mark particularly, and, as it were, set before others in their discourses with them. And I doubt not, but if we had reason to mention particular horses, as often as we have to mention particular men, we should have proper names for the one, as familiar as for the other; and Bucephalus would be a word as much in use as Alexander. And, therefore, we see that amongst jockeys, horses have their proper names to be known and distinguished by, as commonly as their servants: because amongst them, there is often occasion to mention this or that particular horse, when he is out of sight.

§ 6. *How general words are made.*—The next thing to be considered is, how general words come to be made. For since all things that exist are only particulars, how come we by general terms, or where find we those general natures they are supposed to stand for. Words become general, by being made the signs of general ideas: and ideas become general, by separating from them the circumstances of time, and place, and any other ideas that may determine them to this or that particular existence. By this way of abstraction, they are made capable of representing more individuals than one; each of which having in it a conformity to that abstract idea, is (as we call it) of that sort.

§ 7. But to deduce this a little more distinctly, it will not perhaps be amiss to trace our notions and names, from their beginning, and observe by what degrees we proceed, and by what steps we enlarge our ideas from our first infancy. There is nothing more evident, than that the ideas of the persons children converse with (to instance in them alone), are like the persons themselves, only particular. The ideas of the nurse and the mother, are well framed in their minds; and, like pictures of them there, represent only those individuals. The names they first gave to them, are confined to these individuals; and the names of nurse and mamma, the child uses, determine themselves to those persons. Afterwards, when time and a larger acquaintance have made them observe, that there are a great many other things in the world, that in some common agreements of shape, and several other qualities, resemble their father and mother, and those persons they have been used to, they frame an idea, which they find those many particulars do partake in; and to that they give, with others, the name man for example. And thus they come to have a general name, and a general idea. Wherein they make nothing new, but only leave out of the complex idea they had of Peter and James, Mary and Jane, that which is peculiar to each, and retain only what is common to them all.

§ 8. By the same way that they come by the general name and idea of man, they easily advance to more general names and notions. For observing, that several things that differ from their idea of man, and cannot therefore be comprehended under that name, have yet certain qualities, wherein they agree with man, by retaining only those qualities and uniting them into one idea, they have again another and a more general idea; to which having given a name, they make a term of a more comprehensive extension: which new idea is made, not by any new addition, but only, as before, by leaving out the shape, and some other properties signified by the name man, and retaining only a body, with life, sense, and spontaneous motion, comprehended under the name animal.

§ 9. *General natures are nothing but abstract ideas.*—That this is the way whereby men first formed general ideas, and general names to them, I think, is so evident, that there needs no other proof of it, but the considering of a man's self, or others, and the ordinary proceedings of their minds in knowledge: and he that thinks general natures or notions, are any thing else but such abstract and partial ideas of more complex ones, taken at first from particular existences, will, I fear, be at a loss where to find them. For let any one reflect, and then tell me, wherein does his idea of man differ from that of Peter and Paul; or his idea of horse, from that of Bucephalus, but in the leaving out something that is peculiar to each individual; and retaining so much of those particular complex ideas of several particular existences, as they are found to agree in? Of the complex ideas signified by the names man and horse, leaving out but those particulars wherein they differ, and retaining only those wherein they agree, and of those making a new distinct complex idea, and giving the name animal to it, one has a more general term, that comprehends, with man, several other creatures. Leave out of the idea of animal, sense and spontaneous motion, and the remaining complex idea, made up of the remaining simple ones of body, life, and nourishment, becomes a more general one, under the more comprehensive term *vivens*. And not to dwell longer upon this particular, so evident in itself, by the same way the mind proceeds to body, substance, and at last to being, thing, and such universal terms which stand for any of our ideas whatsoever. To conclude, this whole mystery of *genera* and *species*, which make such a noise in the schools, and are, with justice, so little regarded out of them, is nothing else but abstract ideas, more or less comprehensive, with names annexed to them. In all which, this is constant and unvariable, that every more general term stands for such an idea, as is but a part of any of those contained under it.

§ 10. *Why "the genus" is ordinarily made use of in definitions.*—This may shew us the reason why in the defining of words which is nothing but declaring their significations, we make use of the *genus*, or next general word that comprehends it. Which is not out of necessity, but only to save the labour of enumerating the several simple ideas, which the next general word, or *genus*, stands for; or, perhaps, sometimes the shame of not being able to do it. But though defining by *genus* and *differentia* (I crave leave to use these terms of art, though

originally Latin, since they most properly suit those notions they are applied to), I say, though defining by the *genus* be the shortest way, yet I think it may be doubted, whether it be the best. This I am sure, it is not the only, and so not absolutely necessary. For definition being nothing but making another understand by words, what idea the term defined stands for, a definition is best made by enumerating those simple ideas that are combined in the signification of the term defined: and if, instead of such an enumeration, men have accustomed themselves to use the next general term, it has not been out of necessity, or for greater clearness; but for quickness and dispatch sake. For, I think, that to one who desired to know what idea the word man stood for; if it should be said, that man was a solid extended substance, having life, sense, spontaneous motion, and the faculty of reasoning, I doubt not but the meaning of the term man, would be as well understood, and the idea it stands for, be at least as clearly made known, as when it is defined to be a rational animal; which, by the several definitions of *animal vivens*, and *corpus*, resolves itself into those enumerated ideas. I have, in explaining the term man, followed here the ordinary definition of the schools: which though, perhaps, not the most exact, yet serves well enough to my present purpose. And one may, in this instance, see what gave occasion to the rule, that a definition must consist of *genus* and *differentia*; and it suffices to shew us the little necessity there is of such a rule, or advantage in the strict observing of it. For definitions, as has been said, being only the explaining of one word, by several others, so that the meaning or idea it stands for, may certainly be known; languages are not always so made, according to the rules of logic, that every term can have its signification exactly and clearly expressed by two others. Experience sufficiently satisfies us to the contrary; or else those who have made this rule, have done ill that they have given us so few definitions conformable to it. But of definitions, more in the next chapter.

§ 11. *General and universal, are creatures of the understanding.*—To return to general words, it is plain, by what has been said, that general and universal, belong not to the real existence of things; but are the inventions and creatures of the understanding, made by it for its own use, and concern only signs, whether words or ideas. Words are general, as has been said, when used for signs of general ideas: and so are applicable indifferently to many particular things; and ideas are general, when they are set up as the representatives of many particular things; but universality belongs not to things themselves, which are all of them particular in their existence, even those words and ideas, which, in their signification, are general. When, therefore, we quit particulars, the generals that rest, are only creatures of our own making, their general nature being nothing but the capacity they are put into by the understanding, of signifying or representing many particulars. For the signification they have, is nothing but a relation that by the mind of man is added to them.*

* Against this the Bishop of Worcester objects, and our author^a answers as followeth: "However," saith the bishop, "the abstracted ideas are the work of the mind, yet they are

^a In his first letter.

§ 12. *Abstract ideas are the essences of the genera and species.*—The next thing therefore to be considered, is what kind of signification it is, that general words have. For, as it is evident, that they do not

mere creatures of the mind : as appears by an instance produced of the essence of the sun being in one single individual : in which case it is granted, That the idea may be so abstracted, that more suns might agree in it, and it is as much a sort, as if there were as many suns as there are stars. So that here we have a real essence subsisting in one individual, but capable of being multiplied into more, and the same essence remaining. But in this one sun, there is a real essence, and not a mere nominal or abstracted essence : but suppose there were more suns, would not each of them have the real essence of the sun ? For what is it makes the second sun, but having the same real essence with the first ? If it were but a nominal essence, then the second would have nothing but the name.

“This, as I understand,” replies Mr. Locke, “is to prove that the abstract general essence of any sort of things, or things of the same denomination, v. g. of man or marigold, hath a real being out of the understanding ; which, I confess, I am not able to conceive. Your lordship’s proof here, brought out of my Essay, concerning the sun, I humbly conceive, will not reach it ; because what is said there, does not at all concern the real, but nominal essence, as is evident from hence, that the idea I speak of there is a complex idea ; but we have no complex idea of the internal constitution, or real essence, of the sun. Besides, I say expressly, That our distinguishing substances into species by names, is not at all founded on their real essences. So that the sun being one of these substances, I cannot, in the place quoted by your lordship, be supposed to mean by essence of the sun, the real essence of the sun, unless I had so expressed it. But all this argument will be at an end, when your lordship shall have explained what you mean by these words, ‘true sun.’ In my sense of them, any thing will be a true sun, to which the name sun may be truly and properly applied ; and to that substance or thing the name sun may be truly and properly applied, which has united in it that combination of sensible qualities, by which any thing else, that is called sun, is distinguished from other substances, i. e. by the nominal essence ; and thus our sun is denominated and distinguished from a fixed star, not by a real essence that we do not know (for if we did, it is possible we should find the real essence or constitution of one of the fixed stars to be the same with that of our sun), but by a complex idea of sensible qualities co-existing, which, wherever they are found, make a true sun. And thus I crave leave to answer your lordship’s question : ‘For what is it makes the second sun to be a true sun, but having the same real essence with the first ? If it were but a nominal essence, then the second would have nothing but the name.’

“I humbly conceive, if it had the nominal essence, it would have something besides the name, viz., That nominal essence, which is sufficient to denominate it truly a sun, or to make it to be a true sun, though we know nothing of that real essence whereon that nominal one depends. Your lordship will then argue, that that real essence is in the second sun, and makes the second sun. I grant it when the second sun comes to exist, so as to be perceived by us to have all the ideas contained in our complex idea, i. e. in our nominal essence of a sun. For should it be true (as is now believed by astronomers), that the real essence of the sun were in any of the fixed stars, yet such a star could not for that be by us called a sun, whilst it answers not our complex idea, or nominal essence of a sun. But how far that will prove, that the essences of things, as they are knowable by us, have a reality in them distinct from that of abstract ideas in the mind, which are merely creatures of the mind, I do not see ; and we shall farther inquire, in considering your lordship’s following words. ‘Therefore,’ say you, ‘there must be a real essence in every individual of the same kind.’ Yes, and I beg leave of your lordship to say, of a different kind too. For that alone is it which makes it to be what it is.

“That every individual substance has real, internal, individual constitution, i. e. a real essence, that it makes it to be what it is, I readily grant. Upon this, your lordship says, ‘Peter, James, and John, are all true and real men.’ Answer. Without doubt, supposing them to be men, they are true and real men, i. e. supposing the name of that species belongs to them. And so these three bobagues are all true and real bobagues, supposing the name of that species of animals belongs to them.

“For I beseech your lordship to consider, whether in your way of arguing, by naming them Peter, James, and John, names familiar to us, as appropriated to individuals of the species man, your lordship does not first suppose them men, and then very safely ask, whether they be not all true and real men ? But if I should ask your lordship, whether Weweena, Chuckery, and Consheda, were true and real men or no ? your lordship would not be able to tell me, till, I having pointed out to your lordship the individuals called by those names, your lordship, by examining whether they had in them those sensible qualities which your lordship has combined into that complex idea to which you give the specific name man, determined them all, or some of them, to be the species which you call man, and so to be

signify barely one particular thing; for then they would not be general terms, but proper names; so, on the other side, it is as evident, they do not signify a plurality; for man and men would then signify the same;

true and real man; which, when your lordship has determined, it is plain you did it by that which is only the nominal essence, as not knowing the real one. But your lordship farther asks, 'What is it makes Peter, James, and John, real men? Is it the attributing the general name to them? No, certainly; but that the true and real essence of a man is in every one of them.'

"If when your lordship asks, 'What makes them men?' your lordship used the word making in the proper sense for the efficient cause, and in that sense it were true, that the essence of a man, i. e. the specific essence of that species made a man: it would undoubtedly follow, that this specific essence had a reality beyond that of being only a general abstract idea in the mind. But when it is said that it is the true and real essence of a man in every one of them, that makes Peter, James, and John, true and real men, the true and real meaning of these words is no more, but that the essence of that species, i. e. the properties answering the complex abstract idea to which the specific name is given, being found in them, that makes them be properly and truly called men, or is the reason why they are called men. Your lordship adds, 'And we must be as certain of this, as we are that they are men.'

"How, I beseech your lordship, are we certain that they are men, but only by our senses, finding those properties in them which answer the abstract complex idea which is in our minds, of the specific idea to which we have annexed the specific name man? This I take to be the true meaning of what your lordship says in the next words, viz. 'They take their denomination of being men from that common nature or essence which is in them;' and I am apt to think these words will not hold true in any other sense.

"Your lordship's fourth inference begins thus: 'That the general idea is not made from the simple ideas by the mere act of the mind abstracting from circumstances but from reason and consideration of the nature of things.'

"I thought, my lord, that reason and consideration had been acts of the mind, mere acts of the mind, when any thing was done by them. Your lordship gives a reason for it, viz. For when we see several individuals that have the same powers and properties, we thence infer, that there must be something common to all, which makes them of one kind.'

"I grant the inference to be true; but must beg leave to deny that this proves that the general idea the name is annexed to, is not made by the mind. I have said, and it agrees with what your lordship here says,^a That 'the mind, in making its complex ideas of substances, only follows nature, and puts no ideas together, which are not supposed to have an union in nature. Nobody joins the voice of a sheep with the shape of a horse; or the colour of lead with the weight and fixedness of gold, to be the complex ideas of any real substances; unless he has a mind to fill his head with chimeras, and his discourses with unintelligible words. Men observing certain qualities always joined and existing together, therein copied nature, and of ideas so united, made their complex ones of substance, &c.' Which is very little different from what your lordship here says, 'that it is from our observation of individuals, that we come to infer, that there is something common to them all.' But I do not see how it will thence follow that the general or specific idea is not made by the mere act of the mind. 'No,' says your lordship, 'there is something common to them all, which makes them of one kind; and if the difference of kinds be real, that which makes them all of one kind, must not be a nominal, but real, essence.'

"This may be some objection to the name of nominal essence; but is, as I humbly conceive, none to the thing designed by it. There is an internal constitution of things, on which their properties depend. This your lordship and I are agreed of, and this we call the real essence. There are also certain complex ideas, or combinations of these properties in men's minds to which they commonly annex specific names, or names of sorts or kinds of things. This, I believe, your lordship does not deny. These complex ideas, for want of a better name, I have called nominal essences; how properly, I will not dispute. But if any one will help me to a better name for them, I am ready to receive it: till then, I must to express myself, use this: Now my lord, body, life, and the power of reasoning, being not the real essence of a man, as I believe your lordship will agree, will your lordship say, that they are not enough to make the thing wherein they are found, of the kind called man, and not of the kind called baboon, because the difference of these kinds is real? If this be not real enough to make the thing of one kind, and not of another, I do not see how *animal rationale* can be enough really to distinguish a man from a horse; for that is but the nominal, not real essence of that kind, designed by the name man. And yet, I suppose, every one thinks it real enough to make a real difference between that and other kinds. And if nothing will serve the turn, to MAKE things of one kind, and not of another (which as I have shewn, signifies no more but ranking of them under different specific names), but their real unknown

^a B. 3. c. 6. § 28, 29.

and the distinction of numbers (as the grammarians call them) would be superfluous and useless. That then which general words signify is a sort of things, and each of them does that by being a sign of an ab-

constitutions, which are the real essences we are speaking of, I fear it would be a long while before we should have really different kinds of substances, or distinct names for them, unless we could distinguish them by these differences, of which we have no distinct conceptions. For I think it would not be readily answered me, if I should demand, wherein lies the real difference in the internal constitution of a stag from that of a buck, which are each of them very well known, to be of one kind, and not of the other; and nobody questions but that the kinds whereof each of them is, are really different.

“Your lordship farther says, ‘And this difference doth not depend upon the complex ideas of substances, whereby men arbitrarily join modes together in their minds.’ I confess, my lord, I know not what to say to this, because I do not know what these complex ideas of substances are, whereby men arbitrarily join modes together in their minds. But I am apt to think there is a mistake in the matter, by the words that follow, which are these. ‘For let them mistake in their complication of ideas, either in leaving out or putting in what doth not belong to them; and let their ideas be what they please, the real essence of a man, and a horse, and a tree, are just what they were.’

“The mistake I spoke of, I humbly suppose is this, that things are here taken to be distinguished by their real essences; when, by the very way of speaking of them, it is clear, that they are already distinguished by their nominal essences, and are so taken to be. For what I beseech your lordship, does your lordship mean, when you say, ‘The real essence of a man, and a horse, and a tree,’ but that there are such kinds already set out by the signification of these names, ‘man, horse, tree?’ And what, I beseech your lordship, is the signification of each of these specific names, but the complex idea it stands for? And that complex idea is the nominal essence and nothing else. So that taking man as your lordship does here, to stand for a kind or sort of individuals, all which agree in that common complex idea, which that specific name stands for, it is certain that the real essence of all the individuals comprehended under the specific name man, in your use of it would be just the same; let others leave out or put into their complex idea of man what they please; because the real essence on which that unaltered complex idea, i. e. those properties depend, must necessarily be concluded to be the same.

“For I take it for granted, that in using the name man, in this place, your lordship uses it for that complex idea which is in your lordship’s mind of that species. So that your lordship, by putting it for or substituting it in, the place of that complex idea where you say the real essence of it is just as it was, or the very same as it was, does suppose the idea it stands for to be steadily the same. For if I change the signification of the word man, whereby it may not comprehend just the same individuals which in your lordship’s sense it does, but shut out some of those that to your lordship are men, in your signification of the word man, or take in others, to which your lordship does not allow the name man; I do think you will say, that the real essence of man in both these senses is the same. And yet your lordship seems to say so, when you say, ‘Let men mistake in the complication of their ideas, either in leaving out or putting in what doth not belong to them;’ and let their ideas be what they please, the real essence of the individuals comprehended under the names annexed to these ideas, will be the same, for so, I humbly conceive, it must be put, to make out what your lordship aims at. For as your lordship puts it by the name of man, or any other specific name, your lordship seems to me to suppose, that that name stands for, and not for, the same idea, at the same time.

“For example, my lord, let your lordship’s idea to which you annex the sign man, be a rational animal: let another man’s idea be a rational animal of such a shape; let a third man’s idea be of an animal of such a size and shape leaving out rationality; let a fourth’s be an animal with a body of such a shape, and an immaterial substance, with a power of reasoning; let a fifth leave out of his idea, an immaterial substance. It is plain every one of these will call his a man, as well as your lordship; and yet it is as plain that men, as standing for all these distinct complex ideas, cannot be supposed to have the same internal constitution, i. e. the same real essence. The truth is, every distinct abstract idea with a name to it, makes a real distinct kind, whatever the real essence (which we know not any of them) be.

“And therefore I grant it true what your lordship says in the next words: ‘And let the nominal essences differ ever so much, the real common essence or nature of the several kinds, are not at all altered by them,’ i. e. that our thoughts or ideas cannot alter the real constitutions that are in things that exist, there is nothing more certain. But yet it is true, that the changes of ideas to which we annex them, can and does alter the signification of their names and thereby alter the kinds, which by these names we rank and sort them into. Your lordship farther adds, ‘And these real essences are unchangeable,’ i. e. the internal constitution

stract idea in the mind, to which idea, as things existing are found to agree, so they come to be ranked under that name; or, which is all one, be of that sort. Whereby it is evident, that the essences of the sorts, or (if the Latin word pleases better) species of things, are nothing else but these abstract ideas. For the having the essence of any species, being that which makes any thing to be of that species, and the conformity to the idea to which the name is annexed, being that which gives a right to that name, the having the essence, and the having the conformity must needs be the same thing; since to be of any species, and to have a right to the name of that species, is all one. As, for example, to be a man, or of the species man, and to have a right to the name man, is the same thing. Again to be a man, or of the species man, and have the essence of a man, is the same thing. Now, since nothing can be a man, or have a right to the name man, but what has a conformity to the abstract idea the name man stands for; nor any thing be a man, or have a right to the species man, but what has the essence of that species; it follows, that the abstract idea for which the name stands, and the essence of the species is one and the same. From whence it is easy to observe, that the essences of the sorts of things, and consequently the sorting of this, is the workmanship of the understanding that abstracts, and makes those general ideas.

§ 13. *They are the workmanship of the understanding, but have their foundation in the similitude of things.*—I would not here be thought to forget, much less to deny, that nature in the production of things, makes several of them alike; there is nothing more obvious, especially in the races of animals, and all things propagated by seed. But yet I think we may say, the sorting of them under names, is the workmanship of the understanding, taking occasion from the similitude it observes amongst them, to make abstract general ideas, and set them up in the mind, with names annexed to them, as patterns or forms (for in that sense the word form has a very proper signification), to which, as particular things existing are found to agree, so they come to be of that species, have that denomination, or are put into that *classis*. For when we say, this is a man, that a horse; this justice, that cruelty; this a watch, that a jack; what do we else but rank things under different specific names, as agreeing to those abstract ideas, of which we have

are unchangeable. Of what, I beseech your lordship, are the internal constitutions unchangeable? Not of any that exist, but of God alone; for they may be changed all as easily by that hand that made them, as the internal frame of a watch. What then is it that is unchangeable? The internal constitution or real essence of a species: which, in plain English, is no more but this, whilst the same specific name, v. g. of man, horse, or tree, is annexed to, or made the sign of the same abstract complex idea under which I rank several individuals; it is impossible but the real constitution on which that unaltered complex idea or nominal essence depends, must be the same, i. e. in other words, where we find all the same properties we have reason to conclude there is the same real internal constitution from which those properties flow.

“But your lordship proves the real essences to be unchangeable, because God makes them in these following words: ‘For, however there may happen some variety in individuals by particular accidents, yet the essences of men, and horses, and trees, remain always the same; because they do not depend on the ideas of men, but on the will of the Creator, who hath made several sorts of beings.’

“It is true, the real constitutions or essences of particular things existing, do not depend on the ideas of men, but on the will of the Creator; but their being ranked into sorts, under such and such names, does depend, and wholly depend, on the ideas of men.”

made those names the signs? And what are the essences of those species, set out and marked by names, but those abstract ideas in the mind; which are, as it were, the bonds between particular things that exist, and the names they are to be ranked under? and when general names have any connexion with particular beings, these abstract ideas are the medium that unites them; so that the essences of species, as distinguished and denominated by us, neither are, nor can be, any thing but these precise abstract ideas we have in our minds. And, therefore, the supposed real essences of substances, if different from our abstract ideas, cannot be the essences of the species we rank things into. For two species may be one, as rationally as two different essences be the essence of one species; and I demand, what are the alterations may, or may not, be in a horse or lead, without making either of them to be of another species? In determining the species of things by our abstract ideas, this is easy to resolve; but if any one will regulate himself herein, by supposed real essences, he will, I suppose, be at a loss: and he will never be able to know when any thing precisely ceases to be of the species of a horse or lead.

§ 14. *Each distinct abstract idea is a distinct essence.*—Nor will any one wonder, that I say these essences, or abstract ideas (which are the measures of name, and the boundaries of species), are the workmanship of the understanding, who considers that at least the complex ones are often, in several men, different collections of simple ideas; and therefore, that is covetousness to one man, which is not so to another. Nay, even in substances, where their abstract ideas seem to be taken from the things themselves, they are not constantly the same; no, not in that species which is most familiar to us, and with which we have the most intimate acquaintance; it having been more than once doubted, whether the foetus born of a woman, were a man, even so far that it hath been debated, whether it were, or were not to be nourished and baptized; which could not be, if the abstract idea, or essence, to which the name man belonged, were of nature's making: and were not the uncertain and various collection of simple ideas, which the understanding puts together, and then abstracting it, affixed a name to it. So that, in truth, every distinct abstract idea, is a distinct essence: and the names that stand for such distinct ideas, are the names of things essentially different. Thus a circle is as essentially different from an oval, as a sheep from a goat; and rain is as essentially different from snow, as water from earth; that abstract idea, which is the essence of one, being impossible to be communicated to the other. And thus any two abstract ideas, that in any part vary one from another, with two distinct names annexed to them, constitute two distinct sorts, or, if you please, species, as essentially different as any two the most remote or opposite in the world.

§ 15. *Real and nominal essences.*—But since the essences of things are thought by some (and not without reason) to be wholly unknown; it may not be amiss to consider the several significations of the word essence.

First, Essence may be taken for the being of any thing, whereby it is what it is. And thus, the real internal, but generally, in substances,

unknown, constitution of things, whereon their discoverable qualities depend, may be called their essence. This is the proper original signification of the word, as is evident from the formation of it; *essentia*, in its primary notation, signifying properly being. And in this sense it is still used, when we speak of the essence of particular things, without giving them any name.

Secondly, The learning and disputes of the schools, having been much busied about *genus* and *species*, the word essence has almost lost its primary signification; and instead of the real constitution of things, has been almost wholly applied to the artificial constitution of *genus* and *species*. It is true, there is ordinarily supposed a real constitution of the sorts of things; and it is past doubt, there must be some real constitution, on which any collection of simple ideas, co-existing must depend. But it being evident, that things are ranked under names into sorts or species, only as they agree to certain abstract ideas, to which we have annexed those names, the essence of each *genus* or sort, comes to be nothing but that abstract idea, which the general, or sortal (if I may have leave so to call it from sort, as I do general from *genus*), name stands for. And this we shall find to be that which the word essence imports, in its most familiar use. These two sorts of essences, I suppose, may not unfitly be termed, the one the real, the other the nominal, essence.

§ 16. *Constant connexion between the name and nominal essence.*—Between the nominal essence, and the name, there is so near a connexion that the name of any sort of things cannot be attributed to any particular being, but what has this essence, whereby it answers that abstract idea, whereof that name is the sign.

§ 17. *Supposition that species are distinguished by their real essences, useless.*—Concerning the real essences of corporeal substances (to mention these only), there are, if I mistake not, two opinions. The one is of those who using the word essence for they know not what, suppose a certain number of those essences, according to which all natural things are made, and wherein they do exactly, every one of them, partake, and so become of this or that species. The other, and more rational, opinion, is of those, who look on all natural things to have a real but unknown, constitution of their insensible parts, from which flow those sensible qualities, which serve us to distinguish them one from another, according as we have occasion to rank them into sorts, under common denominations. The former of these opinions, which supposes these essences as a certain number of forms or moulds, wherein all natural things, that exist, are cast, and do equally partake, has, I imagine, very much perplexed the knowledge of natural things. The frequent productions of monsters, in all the species of animals, and of changelings, and other strange issues of human birth, carry with them difficulties not possible to consist with this hypothesis; since it is as impossible, that two things, partaking exactly of the same real essence, should have different properties, as that two figures, partaking of the same real essence of a circle, should have different properties. But were there no other reason against it, yet the supposition of essences, that cannot be known; and the making them, nevertheless, to

be that which distinguishes the species of things, is so wholly useless and unserviceable to any part of our knowledge, that that alone were sufficient to make us lay it by, and content ourselves with such essences of the sorts or species of things, as come within the reach of our knowledge; which, when seriously considered, will be found, as I have said, to be nothing else but those abstract complex ideas to which we have annexed distinct general names.

§ 18. *Real and nominal essence, the same in simple ideas and modes, different in substances.*—Essences being thus distinguished into nominal and real, we may farther observe, that in the species of simple ideas and modes they are always the same; but in substances, always quite different. Thus a figure including a space between three lines, is the real as well as nominal essence of a triangle; it being not only the abstract idea to which the general name is annexed, but the very *essentia*, or being, of the thing itself, that foundation from which all its properties flow, and to which they are all inseparably annexed. But it is far otherwise concerning that parcel of matter which makes the ring on my finger, wherein these two essences are apparently different. For it is the real constitution of its insensible parts, on which depend all those properties of colour, weight, fusibility, fixedness, &c. which makes it to be gold, or gives it a right to that name, which is therefore its nominal essence; since nothing can be called gold, but what has a conformity of qualities to that abstract complex idea, to which that name is annexed. But this distinction of essences, belonging particularly to substances, we shall, when we come to consider their names, have an occasion to treat of more fully.

§ 19. *Essences ingenerable and incorruptible.*—That such abstract ideas, with names to them, as we have been speaking of, are essences, may farther appear by what we are told concerning essences, viz. that they are all ingenerable and incorruptible. Which cannot be true of the real constitutions of things, which begin and perish with them. All things that exist, besides their author, are all liable to change; especially those things we are acquainted with, and have ranked into bands, under distinct names or ensigns. Thus that which was grass to-day, is to-morrow the flesh of a sheep; and within a few days after, becomes part of a man; in all which, and the like changes, it is evident, their real essence, i. e. that constitution whereon the properties of these several things depended, is destroyed, and perishes with them. But essences being taken for ideas, established in the mind, with names annexed to them, they are supposed to remain steadily the same whatever mutations the particular substances are liable to. For whatever becomes of Alexander and Bucephalus, the ideas to which man and horse are annexed, are supposed nevertheless to remain the same; and so the essences of those species are preserved whole and undestroyed, whatever changes happen to any, or all of the individuals of those species. By this means the essence of a species rests safe and entire, without the existence of so much as one individual of that kind. For were there now no circle existing any where in the world (as, perhaps, that figure exists not any where exactly marked out), yet the idea annexed to that name would not cease to be what it is; nor cease to be

as a pattern, to determine which of the particular figures we meet with, have, or have not, a right to the name circle, and so to shew which of them, by having that essence, was of that species. And though there neither were, nor had been in nature such a beast as an unicorn, nor such a fish as a mermaid; yet supposing those names to stand for complex abstract ideas, that contained no inconsistency in them; the essence of a mermaid is as intelligible as that of a man; and the idea of an unicorn, as certain, steady, and permanent, as that of a horse. From what has been said, it is evident, that the doctrine of the immutability of essences, proves them to be only abstract ideas; and is founded on the relation established between them, and certain sounds as signs of them; and will always be true, as long as the same name can have the same signification.

§ 20. *Recapitulation.*—To conclude, this is that which in short I would say, viz. that all the great business of *genera* and *species*, and their essences, amounts to no more but this, that men making abstract ideas, and settling them in their minds, with names annexed to them, do thereby enable themselves to consider things, and discourse of them, as it were, in bundles, for the easier and readier improvement and communication of their knowledge, which would advance but slowly, were their words and thoughts confined only to particulars.

CHAP. IV.

OF THE NAMES OF SIMPLE IDEAS.

§ 1. *Names of simple ideas, modes, and substances, have each something peculiar.*—Though all words, as I have shewn, signify nothing immediately but the ideas in the mind of the speaker, yet upon a nearer survey, we shall find that the names of simple ideas, mixed modes (under which I comprise relations too), and natural substances, have each of them something peculiar and different from the other. For example:

§ 2. *First, names of simple ideas and substances, intimate real existence.*—*First*, The names of simple ideas and substances, with the abstract ideas in the mind, which they immediately signify, intimate also some real existence, from which was derived their original pattern. But the names of mixed modes terminate in the idea that is in the mind, and lead not the thoughts any farther, as we shall see more at large in the following chapter.

§ 3. *Secondly, names of simple ideas and modes, signify always both real and nominal essence.*—*Secondly*, The names of simple ideas and modes, signifying always the real, as well as nominal, essence of their species. But the names of natural substances signify rarely, if ever, any thing but barely the nominal essences of those species, as we shall shew in the chapter that treats of the names of substances in particular.

§ 4. *Thirdly, names of simple ideas undefinable.*—*Thirdly*, The names of simple ideas are not capable of any definitions; the names of all complex ideas are. It has not, that I know, hitherto been taken notice of by any body, what words are, and what are not, capable of being defined; the want whereof is, as I am apt to think, not seldom

the occasion of great wrangling and obscurity in men's discourses, whilst some demand definitions of terms that cannot be defined; and others think, they ought to rest satisfied in an explication made by a more general word, and its restriction (or to speak in terms of art, by a *genus* and difference), when even after such definition made according to rule, those who hear of it, have often no more a clear conception of the meaning of the word, than they had before. This at least, I think, that the shewing what words are, and what are not, capable of definitions, and wherein consists a good definition, is not wholly beside our present purpose; and perhaps will afford so much light to the nature of these signs, and our ideas, as to deserve a more particular consideration.

§ 5. *If all were definable, it would be a process in infinitum.*—I will not here trouble myself, to prove that all terms are not definable from that progress, *in infinitum*, which it will visibly lead us into, if we should allow, that all names could be defined. For if the terms of one definition, were still to be defined by another, where at last should we stop? But I shall, from the nature of our ideas, and the signification of our words, shew, why some names can, and others cannot, be defined, and which they are.

§ 6. *What a definition is.*—I think it is agreed, that a definition is nothing else, but the shewing the meaning of one word by several other not synonymous terms. The meaning of words, being only the ideas they are made to stand for by him that uses them; the meaning of any term is then shewn, or the word is defined, when by other words the idea it is made the sign of, and annexed to in the mind of the speaker, is, as it were, represented, or set before the view of another; and thus its signification ascertained. This is the only use and end of definitions; and therefore the only measure of what is, or is not, a good definition.

§ 7. *Simple ideas why undefinable.*—This being premised, I say, that the names of simple ideas, and those only, are incapable of being defined. The reason whereof is this, that the several terms of a definition, signifying several ideas, they can altogether by no means represent an idea, which has no composition at all; and therefore definition, which is properly nothing but the shewing the meaning of one word by several others, not signifying each the same thing, can in the names of simple ideas have no place.

§ 8. *Instances; motion.*—The not observing this difference in our ideas, and their names, has produced that eminent trifling in the schools, which is so easy to be observed in the definitions they give us of some few of these simple ideas. For as to the greatest part of them, even those masters of definitions were fain to leave them untouched, merely by the impossibility they found in it. What more exquisite jargon could the wit of man invent, than this definition, "The act of a being in power, as far forth as in power?" which would puzzle any rational man, to whom it was not already known by its famous absurdity, to guess what word it could ever be supposed to be the explication of. If Tully, asking a Dutchman what *beweeginge* was, should have received this explication in his own language, that it was *actus entis in potentia quatenus in potentia*; I ask whether any one can imagine he could thereby have under-

stood what the word *beweeginge* signified, or have guessed what idea a Dutchman ordinarily had in his mind, and would signify to another, when he used that sound.

§ 9. Nor have the modern philosophers, who have endeavoured to throw off the jargon of the schools, and speak intelligibly, much better succeeded in defining simple ideas, whether by explaining their causes, or any otherwise. The atomists, who define motion to be a passage from one place to another, what do they more than put one synonymous word for another? For what is passage other than motion? And if they were asked what passage was, how would they better define it than by motion? For is it not at least as proper and significant to say, passage is a motion from one place to another, as to say, motion is a passage, &c.? This is to translate, and not to define, when we change two words of the same signification one for another; which when one is better understood than the other, may serve to discover what idea the unknown stands for; but is very far from a definition, unless we will say, every English word in the dictionary, is the definition of the Latin word it answers, and that motion is a definition of *motus*. Nor will the successive application of the parts of the superficies of one body, to those of another, which the Cartesians give us, prove a much better definition of motion when well examined.

§ 10. *Light*.—"The act of perspicuous, as far forth as perspicuous," is another peripatetic definition of a simple idea; which though not more absurd than the former of motion, yet betrays its uselessness and insignificancy more plainly, because experience will easily convince any one, that it cannot make the meaning of the word light (which it pretends to define) at all understood by a blind man: but the definition of motion appears not at first sight so useless, because it escapes this way of trial. For this simple idea, entering by the touch as well as sight, it is impossible to shew an example of any one, who has no other way to get the idea of motion, but barely by the definition of that name. Those who tell us, that light is a great number of little globules, striking briskly on the bottom of the eye, speak more intelligibly than the schools: but yet these words ever so well understood, would make the idea the word light stands for, no more known to a man that understands it not before, than if one should tel lhim, that light was nothing but a company of little tennis-balls, which fairies all day long struck with rackets against some men's foreheads, whilst they passed by others. For granting this explication of the thing to be true; yet the idea of the cause of light, if we had it ever so exact, would no more give us the idea of light itself, as it is such a particular perception in us, than the idea of the figure and motion of a sharp piece of steel, would give us the idea of that pain which it is able to cause in us. For the cause of any sensation, and the sensation itself, in all the simple ideas of one sense, are two ideas; and two ideas so different and distant one from another, that no two can be more so. And therefore should Des Cartes' globules strike ever so long on the *retina* of a man, who was blind by a *gutta serena*, he would thereby never have any idea of light, or any thing approaching it, though he understood what little globules were, and what striking on another body was, ever so well. And

therefore the Cartesians very well distinguish between that light which is the cause of that sensation in us, and the idea which is produced in us by it, and is that which is properly light.

§ 11. *Simple ideas, why undefinable, farther explained.*—Simple ideas, as has been shewn, are only to be got by those impressions objects themselves make on our minds by the proper inlets appointed to each sort. If they are not received this way, all the words in the world, made use of to explain or define any of their names, will never be able to produce in us the idea it stands for. For words being sounds, can produce in us no other simple ideas, than of those very sounds; nor excite any in us, but by that voluntary connexion which is known to be between them, and those simple ideas which common use has made them signs of. He that thinks otherwise, let him try if any words can give him the taste of a pine-apple, and make him have the true idea of the relish of that celebrated delicious fruit. So far as he is told it has a resemblance with any tastes, whereof he has the ideas already in his memory, imprinted there by sensible objects, not strangers to his palate, so far may he approach that resemblance in his mind. But this is not giving us that idea by a definition, but exciting in us other simple ideas, by their known names; which will be still very different from the true taste of that fruit itself. In light and colours, and all other simple ideas, it is the same thing: for the signification of sounds is not natural, but only imposed and arbitrary. And no definition of light, or redness, is more fitted, or able, to produce either of those ideas in us, than the sound light or red, by itself. For to hope to produce an idea of light, or colour, by a sound, however formed, is to expect that sounds should be visible, or colours audible; and to make the ears do the office of all the other senses. Which is all one as to say, that we might taste, smell, and see by the ears: a sort of philosophy worthy only of Sancho Pan-cha, who had the faculty to see Dulcinea by hearsay. And therefore he that has not before received into his mind, by the proper inlet, the simple idea which any word stands for, can never come to know the signification of that word, by any other words, or sounds, whatsoever put together, according to any rules of definition. The only way is, by applying to his senses the proper object; and so producing that idea in him, for which he has learned the name already. A studious blind man, who had mightily beat his head about visible objects, and made use of the explication of his books and friends, to understand those names of light and colours which often came in his way; bragged one day, that he now understood what scarlet signified. Upon which, his friend demanding, what scarlet was? the blind man answered, it was like the sound of a trumpet. Just such an understanding of the name of any other simple idea will he have, who hopes to get it only from a definition, or other words made use of to explain it.

§ 12. *The contrary shewn in complex ideas, by instances of a statue and rainbow.*—The case is quite otherwise in complex ideas; which consisting of several simple ones, it is in the power of words, standing for the several ideas, that make that composition, to imprint complex ideas in the mind, which were never there before, and so make their names be understood. In such collections of ideas, passing under one

name, definition, or the teaching the signification of one word, by several others, has place, and may make us understand the names of things, which never came within the reach of our senses; and frame ideas suitable to those in other men's minds, when they use those names: provided that none of the terms of the definition stand for any such simple ideas, which he to whom the explication is made, has never yet had in his thought. Thus the word statue may be explained to a blind man by other words, when picture cannot, his senses having given him the idea of figure, but not of colours, which therefore words cannot excite in him. This gained the prize to the painter, against the statuary; each of which contending for the excellency of his art, and the statuary bragging that his was to be preferred, because it reached farther, and even those who had lost their eyes, could yet perceive the excellency of it. The painter agreed to refer himself to the judgment of a blind man; who being brought where there was a statue made by the one, and a picture drawn by the other; he was first led to the statue, in which he traced with his hands, all the lineaments of the face and body; and with great admiration, applauded the skill of the workman. But being led to the picture, and having his hands laid upon it, was told that now he touched the head, and then the forehead, eyes, nose, &c. as his hands moved over the parts of the picture on the cloth, without finding any the least distinction: whereupon he cried out, that certainly that must needs be a very admirable and divine piece of workmanship, which could represent to them all those parts, where he could neither feel nor perceive any thing.

§ 13. He that should use the word rainbow, to one who knew all those colours, but yet had never seen that phenomenon, would, by enumerating the figure, largeness, position, and order of the colours, so well define that word, that it might be perfectly understood. But yet that definition, how exact and perfect soever, would never make a blind man understand it; because several of the simple ideas that make that complex one, being such as he never received by sensation and experience, no words are able to excite them in his mind.

§ 14. *The names of complex ideas when to be made intelligible by words.*—Simple ideas, as has been shewn, can only be got by experience, from those objects which are proper to produce in us those perceptions. When by this means we have our minds stored with them, and know the names for them, then we are in a condition to define, and by definition, to understand, the names of complex ideas, that are made up of them. But when any term stands for a simple idea, that a man has never yet had in his mind, it is impossible, by any words, to make known its meaning to him. When any term stands for an idea a man is acquainted with, but is ignorant that that term is the sign of it, there another name, of the same idea which he has been accustomed to, may make him understand its meaning. But in no case whatsoever, is any name, of any simple idea, capable of a definition.

§ 15. *Fourthly, names of simple ideas least doubtful.*—*Fourthly,* But though the names of simple ideas have not the help of definition to determine their signification; yet that hinders not, but that they are generally less doubtful and uncertain, than those of mixed modes and

substances. Because they standing only for one simple perception, men, for the most part, easily and perfectly agree in their signification: and there is little room for mistake and wrangling about their meaning. He that knows once, that whiteness is the name of that colour he has observed in snow or milk, will not be apt to misapply that word, as long as he retains that idea; which, when he has quite lost, he is not apt to mistake the meaning of it, but perceives he understands it not. There is neither a multiplicity of simple ideas to be put together, which makes the doubtfulness in the names of mixed modes; nor a supposed, but an unknown, real essence, with properties depending thereon, the precise number whereof is also unknown, which makes the difficulty in the names of substances. But, on the contrary, in simple ideas, the whole signification of the name is known at once, and consists not of parts, whereof more or less being put in, the idea may be varied, and so the signification of name be obscure or uncertain.

§ 16. *Fifthly, simple ideas have few ascents in lineâ prædicamentali.*—*Fifthly,* This farther may be observed, concerning simple ideas and their names, that they have but few ascents in *lineâ prædicamentali* (as they call it), from the lowest species to the *summum genus*. The reason whereof is, that the lowest species being but one simple idea nothing can be left out of it, that so the difference being taken away, it may agree with some other thing in one idea common to them both: which having one name, is the *genus* of the other two: v. g. there is nothing can be left out of the idea of white and red, to make them agree in one common appearance, and so have one general name; as rationality being left out of the complex idea of man, makes it agree with brute in the more general idea and name of animal. And, therefore, when to avoid unpleasant enumerations, men would comprehend both white and red, and several other such simple ideas, under one general name they have been fain to do it by a word which denotes only the way they get into the mind. For when white, red, and yellow, are all comprehended under the *genus* or name colour, it signifies no more, but such ideas as are produced in the mind only by the sight, and have entrance only through the eyes. And when they would frame yet a more general term, to comprehend both colours and sounds, and the like simple ideas they do it by a word that signifies all such as come into the mind only by one sense; and so the general term quality, in its ordinary acceptation, comprehends colours, sounds, tastes, smells, and tangible qualities, with distinction from extension, number, motion, pleasure, and pain, which make impressions on the mind, and introduce their idea by more senses than one.

§ 17. *Sixthly, names of simple ideas stand for ideas, not at all arbitrary.*—*Sixthly,* The names of simple ideas, substances, and mixed modes, have also this difference: that those of mixed modes stand for ideas, perfectly arbitrary: those of substances, are not perfectly so; but refer to a pattern, though with some latitude: and those of simple ideas are perfectly taken from the existence of things, and are not arbitrary at all. Which, what difference it makes in the significations of their names, we shall see in the following chapters.

The names of simple modes differ little from those of simple ideas.

CHAP. V.

OF THE NAMES OF MIXED MODES AND RELATIONS.

§ 1. *They stand for abstract ideas, as well as other general names.*

—The names of mixed modes being general, they stand, as has been shewn, for sorts or species of things, each of which has its peculiar essence. The essences of these species also, as has been shewn, are nothing but the abstract ideas in the mind, to which the name is annexed. Thus far the names and essences of mixed modes, have nothing but what is common to them, with other ideas; but if we take a little nearer survey of them, we shall find that they have something peculiar, which, perhaps, may deserve our attention.

§ 2. *First, the ideas they stand for, are made by the understanding.*

—The first particularity I shall observe in them is, that the abstract ideas, or, if you please, the essences, of the several species of mixed modes, are made by the understanding, wherein they differ from those of simple ideas; in which sort, the mind has no power to make any one, but only receives such as are presented to it, by the real existence of things operating upon it.

§ 3. *Secondly, made arbitrarily, and without patterns.*—In the next place, these essences of the species of mixed modes, are not only made by the mind, but made very arbitrarily, made without patterns, or reference to any real existence. Wherein they differ from those of substances, which carry with them the supposition of some real being, from which they are taken, and to which they are conformable. But in its complex ideas of mixed modes, the mind takes a liberty not to follow the existence of things exactly. It unites and retains certain collections, as so many distinct specific ideas, whilst others, that as often occur in nature, and are as plainly suggested by outward things, pass neglected, without particular names or specifications. Nor does the mind, in these of mixed modes, as in the complex ideas of substances, examine them by the real existence of things: or verify them by patterns, containing such peculiar compositions in nature. To know whether his idea of adultery, or incest, be right, will a man seek it any where amongst things existing? Or, is it true, because any one has been witness to such an action? No: but it suffices here, that men have put together such a collection, into one complex idea, that makes the archetype and specific idea, whether ever any such action were committed in *rerum natura*, or no.

§ 4. *How this is done.*—To understand this aright, we must consider wherein this making of these complex ideas consists; and that is not in the making any new idea, but putting together those which the mind had before. Wherein the mind does these three things; *First*, It chooses a certain number. *Secondly*, It gives them connexion, and makes them into one idea. *Thirdly*, It ties them together by a name. If we examine how the mind proceeds in these, and what liberty it takes in them, we shall easily observe how these essences of the species of mixed modes, are the workmanship of the mind; and consequently, that the species themselves are of men's making.

§ 5. *Evidently arbitrary, in that the idea is often before the existence.*—Nobody can doubt, but that these ideas of mixed modes, are made by a voluntary collection of ideas put together in the mind, independent from any original patterns in nature, who will but reflect, that this sort of complex ideas may be made, abstracted, and have names given them, and so a species be constituted, before any one individual of that species ever existed. Who can doubt, but the ideas of sacrilege, or adultery, might be framed in the minds of men, and have names given them; and so these species of mixed modes be constituted, before either of them was ever committed; and might be as well discoursed of, and reasoned about, and as certain truths discovered of them, whilst yet they had no being but in the understanding, as well as now, that they have but too frequently a real existence? Whereby it is plain, how much the sorts of mixed modes, are the creatures of the understanding, where they have a being as subservient to all the ends of real truth and knowledge, as when they really exist: and we cannot doubt but law-makers have often made laws about species of actions, which were only the creatures of their own understandings: beings that had no other existence, but in their own minds. And, I think, nobody can deny, but that the resurrection was a species of mixed modes in the mind, before it really existed.

§ 6. *Instances; murder, incest, stabbing.*—To see how arbitrarily these essences of mixed modes are made by the mind, we need but take a view of almost any of them. A little looking into them, will satisfy us, that it is the mind that combines several scattered independent ideas, into one complex one; and by the common name it gives them, makes them the essence of a certain species, without regulating itself by any connexion they have in nature. For what greater connexion in nature has the idea of a man, than the idea of a sheep, with killing; that this is made a particular species of action, signified by the word murder; and the other not? Or what union is there in nature, between the idea of a relation of a father, with killing, than that of a son, or neighbour, that those are combined into one complex idea, and thereby, made the essence of the distinct species, parricide, whilst the other make no distinct species at all? But though they have made killing a man's father or mother, a distinct species from killing his son or daughter; yet, in some other cases, son and daughter are taken in too, as well as father and mother; and they are all equally comprehended in the same species, as in that of incest. Thus the mind in mixed modes arbitrarily unites into complex ideas, such as it finds convenient; whilst others that have altogether as much union in nature, are left loose, and never combined into one idea, because they have no need of one name. It is evident then, that the mind, by its free choice, gives a connexion to a certain number of ideas, which, in nature, have no more union with one another, than others that it leaves out; why else is the part of the weapon, the beginning of the wound is made with, taken notice of, to make the distinct species called stabbing, and the figure and matter of the weapon left out? I do not say this is done without reason, as we shall see more by-and-by; but this, I say, that it is done by the free choice of the mind, pursuing its own ends, and that, therefore, these species of mixed modes,

ure the workmanship, of the understanding; and there is nothing more evident, than that, for the most part, in the framing these ideas, the mind searches not its patterns in nature, nor refers the ideas it makes to the real existence of things; but puts such together, as may best serve its own purposes, without tying itself to a precise imitation of any thing that really exists:

§ 7. *But still subservient to the end of language.*—But though these complex ideas, or essences of mixed modes, depend on the mind, and are made by it with great liberty; yet they are not made at random, and jumbled together without any reason at all. Though these complex ideas be not always copied from nature, yet they are always suited to the end for which abstract ideas are made; and though they be combinations made of ideas, that are loose enough, and have as little union in themselves, as several other, to which the mind never gives a connexion that combines them into one idea; yet they are always made for the convenience of communication, which is the chief end of language. The use of language is, by short sounds, to signify, with ease and dispatch, general conceptions: wherein not only abundance of particulars may be contained, but also a great variety of independent ideas collected into one complex one. In the making, therefore, of the species of mixed modes, men have had regard only to such combinations as they had occasion to mention one to another. Those they have combined into distinct complex ideas, and given names to; whilst others, that in nature have as near a union, are left loose and unregarded. For to go no farther than human actions themselves, if they would make distinct abstract ideas of all the varieties might be observed in them, the number must be infinite, and the memory confounded with the plenty, as well as overcharged to little purpose. It suffices, that men make and name so many complex ideas of these mixed modes, as they find they have occasion to have names for, in the ordinary occurrence of their affairs. If they join to the idea of killing, the idea of father, or mother, and so make a distinct species from killing a man's son or neighbour, it is because of the different heinousness of the crime, and the distinct punishment is due to the murdering a man's father and mother, different from what ought to be inflicted on the murder of a son or neighbour; and therefore they find it necessary to mention it by a distinct name, which is the end of making that distinct combination. But though the ideas of mother and daughter, are so differently treated, in reference to the idea of killing, that the one is joined with it to make a distinct abstract idea with a name, and so a distinct species, and the other not; yet in respect of carnal knowledge, they are both taken in under incest; and that still for the same convenience of expressing under one name, and reckoning of one species, such unclean mixtures, as have a peculiar turpitude beyond others; and this, to avoid circumlocutions, and tedious descriptions.

§ 8. *Whereof the intranlatable words of divers languages are a proof.*—A moderate skill in different languages, will easily satisfy one of the truth of this, it being so obvious to observe great store of words in one language, which have not any that answer them in another. Which plainly shews, that those of one country, by their customs and manner of life, have found occasion to make several complex ideas, and

give names to them, which others never collected into specific ideas. This could not have happened, if these species were the steady workmanship of nature; and not collections made and abstracted by the mind in order to naming, and for the convenience of communication. The terms of our law, which are not empty sounds, will hardly find words that answer them in the Spanish or Italian, no scanty languages; much less, I think, could any one translate them into the Caribbee, or Westoe tongues; and the *versura* of the Romans, or *corban* of the Jews, have no words in other languages to answer them; the reason whereof is plain, from what has been said. Nay, if we look a little more nearly into this matter, and exactly compare different languages, we shall find, that though they have words, which, in translations and dictionaries, are supposed to answer one another; yet there is scarce one of ten, amongst the names of complex ideas, especially of mixed modes, that stands for the same precise idea, which the word does that in dictionaries it is rendered by. There are no ideas more common, and less compounded, than the measures of time, extension, and weight, and the Latin names *hora*, *pes*, *libra*, are, without difficulty, rendered by the English names, hour, foot, and pound; but yet there is nothing more evident, than that the ideas a Roman annexed to these Latin names, were very far different from those which an Englishman expresses by those English ones. And if either of these should make use of the measures that those of the other language designed by their names, he would be quite out in his account. These are too sensible proofs to be doubted; and we shall find this much more so, in the names of more abstract and compounded ideas; such as are the greatest part of those which make up moral discourses; whose names, when men come curiously to compare with those they are translated into, in other languages, they will find very few of them exactly to correspond in the whole extent of their significations.

§ 9. *This shews species to be made for communication.*—The reason why I take so particular notice of this, is, that we may not be mistaken about *genera* and *species*, and their essences, as if they were things regularly and constantly made by nature, and had a real existence in things; when they appear, upon a more wary survey, to be nothing else but an artifice of the understanding, for the easier signifying such collections of ideas, as it should often have occasion to communicate by one general term; under which, divers particulars, as far forth as they agreed to that abstract idea, might be comprehended. And if the doubtful signification of the word *species*, may make it sound harsh to some, that I say the species of mixed modes are made by the understanding; yet, I think, it can by nobody be denied, that it is the mind makes those abstract complex ideas, to which specific names are given. And if it be true, as it is, that the mind makes the patterns for sorting and naming of things, I leave it to be considered, who makes the boundaries of the sort or species; since with me, species and sort have no other difference than that of a Latin and English idiom.

§ 10. *In mixed modes, it is the name that ties the combination together, and makes it a species.*—The near relation that there is between species, essences, and their general names, at least in mixed mode

will farther appear, when we consider, that it is the name that seems to preserve those essences, and give them their lasting duration. For the connexion between the loose parts of those complex ideas, being made by the mind, this union, which has no particular foundation in nature, would cease again, were there not something that did, as it were, hold it together, and keep the parts from scattering. Though therefore, it be the mind that makes the collection, it is the name which is, as it were, the knot that ties them fast together. What a vast variety of different ideas, does the word *triumphus* hold together, and deliver to us as one *species*? Had this name been never made, or quite lost, we might no doubt have had descriptions of what passed in that solemnity; but yet I think, that which holds those different parts together, in the unity of one complex idea, is that very word annexed to it; without which, the several parts of that would no more be thought to make one thing, than any other show, which having never been made but once, had never been united into one complex idea, under one denomination. How much, therefore, in mixed modes, the unity necessary to any essence depends on the mind; and how much the continuation and fixing of that unity depends on the name in common use annexed to it, I leave to be considered by those who look upon essences and species as real established things in nature.

§ 11. Suitable to this, we find, that men, speaking of mixed modes, seldom imagine or take any other for species of them, but such as are set out by name: because they being of man's making only in order to naming, no such species are taken notice of, or supposed to be, unless a name be joined to it, as the sign of man's having combined into one idea several loose ones; and by that name, giving a lasting union to the parts, which could otherwise cease to have any, as soon as the mind is rid by that abstract idea, and ceased actually to think on it. But when a name is once annexed to it, wherein the parts of that complex idea have a settled and permanent union; then is the essence, as it were, established, and the species looked on as complete. For to what purpose should the memory charge itself with such compositions, unless it were by abstraction to make them general? And to what purpose make them general, unless it were, that they might have general names, for the convenience of discourse and communication? Thus we see, that striking a man with a sword, or a hatchet, are looked on as no distinct species of action: but if the point of the sword first enter the body, it passes for a distinct species, where it has a distinct name, as in England, in whose language it is called *stabbing*: but in another country, where it has not happened to be specified under a peculiar name, it passes not for a distinct species. But in the species of corporeal substances, though it be the mind that makes the nominal essence; yet since those ideas, which are combined in it, are supposed to have a union in nature, whether the mind joins them or no, therefore those are looked on as distinct names, without any operation of the mind, either abstracting, or giving a name to that complex idea.

§ 12. *For the originals of mixed modes, we look no farther than the mind, which also shews them to be the workmanship of the understanding.*—Conformable also to what has been said concerning the essences

of the species of mixed modes, that they are the creatures of the understanding, rather than the works of nature : conformable, I say, to this, we find, that their names lead our thoughts to the mind, and no farther. When we speak of justice, or gratitude, we frame to ourselves no imagination of any thing existing, which we would conceive; but our thoughts terminate in the abstract ideas of those virtues, and look not farther; as they do, when we speak of a horse, or iron, whose specific ideas we consider not as barely in the mind, but as in things themselves, which afford the original patterns of those ideas. But in mixed modes, at least the most considerable parts of them, which are moral beings, we consider the original patterns as being in the mind; and to those we refer for the distinguishing of particular beings under names. And hence I think it is, that these essences of the species of mixed modes, are, by a more particular name, called notions : as by a peculiar right appertaining to the understanding.

§ 13. *Their being made by the understanding without patterns, shews the reason why they are so compounded.*—Hence likewise we may learn, why the complex ideas of mixed modes are commonly more compounded and decomposed, than those of natural substances. Because they being the workmanship of the understanding, pursuing only its own ends, and the conveniency of expressing in short those ideas it would make known to another, it does, with great ability, unite often into one abstract idea, things that in their nature have no coherence: and so under one term, bundle together a great variety of compounded and decomposed ideas. Thus the name of procession, what a great mixture of independent ideas of persons, habits, tapers, orders, motions sounds, does it contain in that complex one, which the mind of man has arbitrarily put together, to express by that one name? Whereas the complex idea of the sorts of substances, are usually made up of only small number of simple ones; and in the species of animals, these two viz. shape and voice, commonly make the whole nominal essence.

§ 14. *Names of mixed modes stand always for their real essence*—Another thing we may observe from what has been said, is, that the names of mixed modes always signify (when they have any determining signification) the real essences of their species. For these abstract ideas being the workmanship of the mind, and not referred to the real existence of things, there is no supposition of any thing more signified by that name, but barely that complex idea the mind itself has formed, which is all it would have expressed by it; and is that on which all the properties of the species depend, and from which alone they all flow: and so in these, the real and nominal essence is the same; which what concernment it is to the certain knowledge of general truth, shall see hereafter.

§ 15. *Why their names are generally got before their ideas.*—This also may shew us the reason, why for the most part the names of mixed modes are got, before the ideas they stand for are perfectly known. Because there being no species of these ordinarily taken notice of, that have names; and those species, or rather their essences, being abstract complex ideas made arbitrarily by the mind, it is convenient, not necessary, to know the names, before one endeavour to frame the

complex ideas : unless a man will fill his head with a company of abstract complex ideas, which others having no names for, he has nothing to do with, but to lay by, and forget again. I confess, that in the beginning of languages, it was necessary to have the idea, before one gave it the name : and so it is still, where making a new complex idea, one also, by giving it a new name, makes a new word. But this concerns not languages made, which have generally pretty well provided for ideas, which men have frequently occasion to have, and communicate : and in such, I ask, whether it be not the ordinary method, that children learn the names of mixed modes, before they have their ideas ? What one of a thousand ever frames the abstract ideas of glory and ambition, before he has heard the names of them ? In simple ideas and substances, I grant it is otherwise ; which being such ideas as have a real existence and union in nature, the ideas and names are got one before the other, as it happens.

§ 16. *Reason of my being so large on this subject.*—What has been said here of mixed modes, is, with very little difference, applicable also to relations ; which, since every man himself may observe, I may spare myself the pains to enlarge on : especially, since what I have here said concerning words in this third book, will possibly be thought by some to be much more than what so slight a subject required. I allow, it might be brought into a narrower compass : but I was willing to stay my reader on an argument that appears to me new, and a little out of the way (I am sure it is one I thought not of, when I began to write) ; that by searching it to the bottom, and turning it on every side, some part or other might meet with every one's thoughts, and give occasion to the most averse, or negligent, to reflect on a general miscarriage ; which, though of great consequence, is little taken notice of. When it is considered, what a pudder is made about essences, and how much all sorts of knowledge, discourse, and conversation, are pestered and disordered by the careless and confused use and application of words, it will, perhaps, be thought worth while thoroughly to lay it open. And I shall be pardoned if I have dwelt long on an argument which, I think, therefore, needs to be inculcated ; because the faults men are usually guilty of in this kind, are not only the greatest hinderances of true knowledge ; but are so well thought of, as to pass for it. Men would often see what a small pittance of reason and truth, or possibly none at all, is mixed with those huffing opinions they are swelled with ; if they would but look beyond fashionable sounds, and observe what ideas are, or are not, comprehended under those words, with which they are so armed at all points, and with which they so confidently lay about them. I shall imagine I have done some service to truth, peace, and learning, if, by an enlargement on this subject, I can make men reflect on their own use of language ; and give them reason to suspect, that since it is frequent for others, it may also be possible for them, to have sometimes very good and approved words in their mouths, and writings, with very uncertain, little, or no signification. And, therefore, it is not unreasonable for them to be wary herein themselves, and not to be unwilling to have them examined by others. With this design, therefore, I shall go on with what I have farther to say, concerning this matter.

CHAP. VI.

OF THE NAMES OF SUBSTANCES.

§ 1. *The common names of substances stand for sorts.*—The common names of substances, as well as other general terms, stand for sorts; which is nothing else but the being made signs of such complex ideas, wherein several particular substances do, or might, agree, by virtue of which, they are capable of being comprehended in one common conception, and signified by one name. I say, do or might agree: for though there be but one sun existing in the world, yet the idea of it being abstracted, so that more substances (if there were several) might each agree in it; it is as much a sort, as if there were as many suns as there are stars. They want not their reasons, who think there are, and that each fixed star would answer the idea the name sun stands for, to one who was placed in a due distance; which, by the way, may shew us how much the sorts, or, if you please, *genera* and *species* of things (for those Latin terms signify to me no more than the English word sort), depend on such collections of ideas as men have made; and not on the real nature of things: since it is not impossible, but that, in propriety of speech, that might be a sun to one, which is a star to another.

§ 2. *The essence of each sort is the abstract idea.*—The measure and boundary of each sort, or species, whereby it is constituted that particular sort, and distinguished from others, is that we call its essence, which is nothing but that abstract idea to which the name is annexed: so that every thing contained in that idea is essential to that sort. This, though it be all the essence of natural substances that we know, or by which we distinguish them into sorts; yet I call it by a peculiar name, the nominal essence, to distinguish it from that real constitution of substances, upon which depends this nominal essence, and all the properties of that sort, which, therefore, as has been said, may be called the real essence: v. g. the nominal essence of gold, is that complex idea the word gold stands for, let it be, for instance, a body yellow, of a certain weight, malleable, fusible, and fixed. But the real essence, is the constitution of the insensible parts of that body, on which those qualities, and all the other properties of gold, depend. How far these two are different, though they are both called essence, is obvious, at first sight, to discover.

§ 3. *The nominal and real essence different.*—For though, perhaps, voluntary motion, with sense and reason, joined to a body of a certain shape, be the complex idea to which I, and others, annex the name man; and so be the nominal essence of the species so called; yet nobody will say, that that complex idea is the real essence and source of all those operations, which are to be found in any individual of that sort. The foundation of all those qualities, which are the ingredients of our complex idea, is something quite different: and had we such a knowledge of that constitution of man, from which his faculties of moving sensation, and reasoning, and other powers flow, and on which his so regular shape depends, as it is possible angels have, and it is certain his

Maker has, we should have a quite other idea of his essence, than what now is contained in our definition of that species, be it what it will : and our idea of any individual man would be as far different from what it is now, as is his who knows all the springs and wheels, and other contrivances within, of the famous clock at Strasburgh, from that which a gazing countryman has of it, who barely sees the motion of the hand, and hears the clock strike, and observes only some of the outward appearances.

§ 4. *Nothing essential to individuals.*—That essences, in the ordinary use of the word, relates to sorts, and that it is considered in particular beings no farther than, as they are ranked into sorts, appears from hence ; that take but away the abstract ideas, by which we sort individuals, and rank them under common names, and then the thought of any thing essential to any of them, instantly vanishes : we have no notion of the one, without the other ; which plainly shews their relation. It is necessary for me to be as I am ; God and nature has made me so ; but there is nothing I have is essential to me. An accident, or disease, may very much alter my colour, or shape ; a fever, or fall, may take away my reason, or memory, or both ; and an apoplexy, leave neither sense nor understanding, no, nor life. Other creatures of my shape may be made with more and better, and fewer and worse, faculties than I have ; and others may have reason and sense in a shape and body very different from mine. Neither of these are essential to the one, or the other, or to any individual whatsoever, till the mind refers it to some sort or species of things ; and then presently, according to the abstract idea of that sort, something is found essential. Let any one examine his own thoughts, and he will find, that as soon as he supposes or speaks of essential, the consideration of some species, or the complex idea signified by some general name, comes into his mind ; and it is in reference to that, that this or that quality is said to be essential. So that if it be asked, whether it be essential to me, or any other particular corporeal being, to have reason ? I say no ; no more than it is essential to this white thing I write on, to have words in it. But if that particular being be to be counted of the sort man, and to have the name man given it, then reason is essential to it, supposing reason to be a part of the complex idea the name man stands for : as it is essential to this thing I write on to contain words, if I will give it the name treatise, and rank it under that species. So that essential, and not essential, relate only to our abstract ideas, and the names annexed to them ; which amounts to no more but this, that whatever particular thing has not in it those qualities, which are contained in the abstract ideas, which any general terms stand for, cannot be ranked under that species, nor be called by that name, since that abstract idea is the very essence of that species.

§ 5. Thus, if the idea of body, with some people, be bare extension or space, then solidity is not essential to body ; if others make the idea to which they give the name body, to be solidity and extension, then solidity is essential to body. That, therefore, and that alone, is considered as essential, which makes a part of the complex idea the name of a sort stands for, without which, no particular thing can be reckoned of

that sort, nor be entitled to that name. Should there be found a parcel of matter that had all the other qualities that are in iron, but wanted obedience to the loadstone; and would neither be drawn by it, nor receive direction from it, would any one question whether it wanted any thing essential? It would be absurd to ask, whether a thing really existing, wanted any thing essential to it? Or could it be demanded, whether this made an essential or specific difference, or no; since we have no other measure of essential or specific, but our abstract ideas? And to talk of specific differences in nature, without reference to general ideas and names, is to talk unintelligibly. For I would ask any one, what is sufficient to make an essential difference in nature, between any two particular beings, without any regard had to some abstract idea, which is looked upon as the essence and standard of a species? All such patterns and standards, being quite laid aside, particular beings considered barely in themselves, will be found to have all their qualities equally essential; and every thing, in each individual, will be essential to it, or, which is more, nothing at all. For though it may be reasonable to ask, whether obeying the magnet, be essential to iron? yet, I think, it is very improper and insignificant to ask, whether it be essential to the particular parcel of matter I cut my pen with, without considering it under the name iron, or as being of a certain species? And if, as has been said, our abstract ideas, which have names annexed to them, are the boundaries of species, nothing can be essential but what is contained in those ideas.

§ 6. It is true, I have often mentioned a real essence, distinct in substances, from those abstract ideas of them, which I call their nominal essence. By this real essence, I mean, that real constitution of any thing, which is the foundation of all those properties that are combined in, and are constantly found to co-exist with, the nominal essence; that particular constitution which every thing has within itself, without any relation to any thing without it. But essence, even in this sense, relates to a sort, and supposes a species: for being that real constitution on which the properties depend, it necessarily supposes a sort of things, properties belonging only to species, and not to individuals; v. g. supposing the nominal essence of gold, to be body of such a peculiar colour and weight, with malleability and fusibility, the real essence is that constitution of the parts of matter on which these qualities, and their union, depend; and is also the foundation of its solubility in *aqua regia*, and other properties accompanying that complex idea. Here are essences and properties, but all upon supposition of a sort, or general abstract idea, which is considered as immutable: but there is no individual parcel of matter, to which any of these qualities are so annexed, as to be essential to it, or inseparable from it. Indeed as to the real essences of substances, we only suppose their being, without precisely knowing what they are: but that which annexes them still to the species, is the nominal essence, of which they are the supposed foundation and cause.

§ 7. *The nominal essence bounds the species.*—The next thing to be considered is, by which of those essences it is, that substances are determined into sorts, or species; and that, it is evident, is by the nominal essence. For it is that alone, that the name, which is the mark of the

sort, signifies. It is impossible, therefore, that any thing should determine the sorts of things, which we rank under general names, but that idea, which that name is designed as a mark for; which is that, as has been shewn, which we call nominal essence. Why do we say, this is a horse, and that a mule; this is an animal, that an herb? How comes any particular thing to be of this or that sort, but because it has that nominal essence, or, which is all one, agrees to that abstract idea, that name is annexed to? And I desire any one but to reflect on his own thoughts, when he hears or speaks any of those, or other names of substances, to know what sort of essences they stand for.

§ 8. And that the species of things to us, are nothing but the ranking them under distinct names, according to the complex ideas in us, and not according to precise, distinct, real essences in them, is plain from hence, that we find many of the individuals that are ranked into one sort, called by one common name, and so received as being of one species, have yet qualities depending on their real constitutions, as far different one from another, as from others, from which they are accounted to differ specifically. This, as it is easy to be observed by all who have to do with natural bodies; so chemists especially are often, by sad experience, convinced of it, when they sometimes in vain seek for the same qualities in one parcel of sulphur, antimony, or vitriol, which they have found in others. For though they are bodies of the same species, having the same nominal essence, under the same name; yet do they often, upon severe ways of examination, betray qualities so different one from another, as to frustrate the expectation and labour of very wary chemists. But if things were distinguished into species, according to their real essences, it would be as impossible to find different properties in any two individual substances of the same species, as it is to find different properties in two circles, or two equilateral triangles. That is properly the essence to us, which determines every particular to this or that *classis*; or, which is the same thing, to this or that general name: and what can that be else, but that abstract idea to which that name is annexed? And so has, in truth, a reference, not so much to the being of particular things, as to their general denominations.

§ 9. *Not the real essence, which we know not.*—Nor indeed can we rank and sort things, and consequently (which is the end of sorting) denominate them by their real essences, because we know them not. Our faculties carry us no farther towards the knowledge and distinction of substances, than a collection of those sensible ideas, which we observe in them; which however made with the greatest diligence and exactness we are capable of, yet is more remote from the true internal constitution, from which those qualities flow, than, as I said, a countryman's idea is from the inward contrivance of that famous clock at Strasburgh, whereof he only sees the outward figure and motions. There is not so contemptible a plant or animal, that does not confound the most enlarged understanding. Though the familiar use of things about us, take off our wonder, yet it cures not our ignorance. When we come to examine the stones we tread on, or the iron we daily handle, we presently find we know not their make; and can give no reason of

the different qualities we find in them. It is evident, the internal constitution, whereon their properties depend, is unknown to us. For to go no farther than the grossest and most obvious we can imagine amongst them, what is that texture of parts, that real essence, that makes lead and antimony fusible; wood and stones not? What makes lead and iron malleable; antimony and stones not? And yet how infinitely these come short of the fine contrivances, and unconceivable real essences of plants or animals, every one knows. The workmanship of the all-wise and powerful God, in the great fabric of the universe, and every part thereof, farther exceeds the capacity and comprehension of the most inquisitive and intelligent man, than the best contrivance of the most ingenious man, doth the conceptions of the most ignorant of rational creatures. Therefore, we in vain pretend to range things into sorts, and dispose them into certain classes, under names, by their real essences, that are so far from our discovery or comprehension. A blind man may as soon sort things by their colours; and he that has lost his smell, as well distinguish a lily and a rose by their odours, as by those internal constitutions which he knows not. He that thinks he can distinguish sheep and goats by their real essences, that are unknown to him, may be pleased to try his skill in those species, called cassiowary, and querechinchio; and by their internal real essences, determine the boundaries of those species, without knowing the complex idea of sensible qualities, that each of those names stand for, in the countries where those animals are to be found.

§ 10. *Not substantial forms, which we know less.*—Those therefore who have been taught, that the several species of substances had their distinct, internal, substantial forms; and that it was those forms which made the distinction of substances into their true *species* and *genera*, were led yet farther out of the way, by having their minds set upon fruitless inquiries after substantial forms, wholly unintelligible, and whereof we have scarce so much as any obscure or confused conception in general.

§ 11. *That the nominal essence is that whereby we distinguish species, farther evident from spirits.*—That our ranking and distinguishing natural substances into species, consists in the nominal essences the mind makes, and not in the real essences to be found in the things themselves, is farther evident from our ideas of spirits. For the mind getting, only by reflecting on its own operations, those simple ideas which it attributes to spirits, it hath, or can have, no other notion of spirit, but by attributing all those operations it finds in itself, to a sort of beings, without consideration of matter. And even the most advanced notion we have of God is but attributing the same simple ideas which we have got from reflection on what we find in ourselves, and which we conceive to have more perfection in them, than would be in their absence, attributing, I say, those simple ideas to him in an unlimited degree. Thus having got from reflecting on ourselves, the idea of existence, knowledge, power, and pleasure, each of which we find it better to have than to want; and the more we have of each, the better; joining all these together, with infinity to each of them, we have the complex idea of an eternal, omniscient, omnipotent, infinitely wise, and happy Being.

And though we are told, that there are different species of angels; yet we know not how to frame distinct specific ideas of them; not out of any conceit, that the existence of more species than one of spirits, is impossible: but because having no more simple ideas (nor being able to frame more) applicable to such beings, but only those few taken from ourselves, and from the actions of our own minds in thinking, and being delighted, and moving several parts of our bodies, we can no otherwise distinguish in our conceptions the several species of spirits, one from another, but by attributing those operations and powers, we find in ourselves, to them in a higher or lower degree; and so have no very distinct specific ideas of spirits, except only of God, to whom we attribute both duration, and all those other ideas with infinity; to the other spirits, with limitation: nor, as I humbly conceive, do we, between God and them in our ideas, put any difference by any number of simple ideas, which we have of one, and not of the other, but only that of infinity. All the particular ideas of existence, knowledge, will, power, and motion, &c. being ideas derived from the operations of our minds, we attribute all of them to all sorts of spirits, with the difference only of degrees, to the utmost we can imagine, even infinity, when we would frame, as well as we can, an idea of the first Being; who yet, it is certain, is infinitely more remote in the real excellency of his nature, from the highest and most perfect of all created beings, than the greatest man, nay, purest seraph, is from the most contemptible part of matter; and consequently must infinitely exceed what our narrow understandings can conceive of him.

§ 12. *Whereof there are probably numberless species.*—It is not impossible to conceive, nor repugnant to reason, that there may be many species of spirits, as much separated and diversified one from another, by distinct properties, whereof we have no ideas, as the species of sensible things are distinguished one from another, by qualities, which we know, and observe in them. That there should be more species of intelligent creatures above us, than there are of sensible and material below us, is probable to me from hence, that in all the visible corporeal world, we see no chasms or gaps. All quite down from us, the descent is by easy steps, and a continued series of things, that in each remove differ very little one from the other. There are fishes that have wings, and are not strangers to the airy region: and there are some birds, that are inhabitants of the water, whose blood is cold as fishes, and their flesh so like in taste, that the scrupulous are allowed them on fish-days. There are animals so near of kin both to birds and beasts, that they are in the middle between both: amphibious animals link the terrestrial and aquatic together; seals live at land and at sea, and porpoises have the warm blood and entrails of a hog, not to mention what is confidently reported of mermaids, or seamen. There are some brutes, that seem to have as much knowledge and reason, as some that are called men: and the animal and vegetable kingdoms are so nearly joined, that if you will take the lowest of one, and the highest of the other, there will scarce be perceived any great difference between them; and so on, till we come to the lowest and the most inorganic parts of matter, we shall find everywhere, that the several species are linked together, and

differ but in almost insensible degrees. And when we consider the infinite power and wisdom of the Maker, we have reason to think, that it is suitable to the magnificent harmony of the universe, and the great design and infinite goodness of the architect, that the species of creatures should also, by gentle degrees, ascend upward from us, toward his infinite perfection, as we see they gradually descend from us downwards; which, if it be probable, we have reason then to be persuaded, that there are far more species of creatures above us, than there are beneath; we being in degrees of perfection, much more remote from the infinite being of God, than we are from the lowest state of being, and that which approaches nearest to nothing. And yet of all those distinct species, for the reasons above said, we have no clear distinct ideas.

§ 13. *The nominal essence, that of the species, proved from water and ice.*—But to return to the species of corporeal substances. If I should ask any one whether ice and water were two distinct species of things, I doubt not but that I should be answered in the affirmative; and it cannot be denied, but he that says, that they are two distinct species, is in the right. But if an Englishman, bred in Jamaica, who, perhaps had never seen nor heard of ice, coming into England in the winter, find the water he puts in his bason at night, in a great part frozen in the morning, and not knowing any peculiar name it had, should call it hardened water; I ask, whether this would be a new species to him, different from water? And, I think, it would be answered here, it would not be to him a new species, no more than congealed jelly, when it is cold, is a distinct species from the same jelly, fluid and warm; or than liquid gold, in the furnace, is a distinct species from hard gold, in the hands of a workman. And if this be so, it is plain, that our distinct species are nothing but distinct complex ideas, with distinct names annexed to them. It is true, every substance that exists, has its peculiar constitution, whereon depend those sensible qualities and powers we observe in it; but the ranking of things into species, which is nothing but sorting them under several titles, is done by us, according to the ideas that we have of them; which though sufficient to distinguish them by names; so that we may be able to discourse of them, when we have them not present before us; yet, if we suppose it to be done by their real internal constitutions, and that things existing are distinguished by nature into species, by real essences, according as we distinguish them into species by names, we shall be liable to great mistakes.

§ 14. *Difficulties against a certain number of real essences.*—To distinguish substantial beings into species, according to the usual supposition that there are certain precise essences or forms of things, whereby all the individuals existing, are, by nature, distinguished into species, these things are necessary.

§ 15. *First,* To be assured, that nature, in the production of things, always designs them to partake of certain regulated established essences, which are to be the models of all things to be produced. This, in that crude sense, it is usually proposed would need some better explanation, before it can fully be assented to.

§ 16. *Secondly*, It would be necessary to know, whether nature always attains that essence it designs in the production of things. The irregular and monstrous births, that in divers sorts of animals have been observed, will always give us reason to doubt of one, or both, of these.

§ 17. *Thirdly*, It ought to be determined, whether those we call monsters, be really a distinct species, according to the scholastic notion of the word species; since it is certain, that every thing that exists, has its particular constitution; and yet we find, that some of these monstrous productions have few or none of those qualities, which are supposed to result from, and accompany, the essence of that species, from whence they derive their originals, and to which, by their descent, they seem to belong.

§ 18. *Our nominal essences of substances, not perfect collections of properties.*—*Fourthly*, The real essences of those things, which we distinguish into species, and, as so distinguished, we name, ought to be known; i. e. we ought to have ideas of them. But since we are ignorant in these four points, the supposed real essences of things stand us not in stead for the distinguishing substances into species.

§ 19. *Fifthly*, The only imaginable help in this case would be, that having framed perfect complex ideas of the properties of things, flowing from their different real essences, we should thereby distinguish them into species. But neither can this be done; for being ignorant of the real essence itself, it is impossible to know all those properties that flow from it, and are so annexed to it, that any one of them being away, we may certainly conclude, that that essence is not there, and so the thing is not of that species. We can never know what are the precise number of properties depending on the real essence of gold, any one of which failing, the real essence of gold, and consequently gold, would not be there, unless we knew the real essence of gold, itself, and by that determined that species. By the word gold here, I must be understood to design a particular piece of matter; v. g. the last guinea that was coined. For if it should stand here in its ordinary signification for that complex idea which I, or any one else, call gold; i. e. for the nominal essence of gold, it would be jargon; so hard is it to shew the various meaning and imperfection of words, when we have nothing else but words to do it by.

§ 20. By all which it is clear, that our distinguishing substances into species by names, is not at all founded on their real essences; nor can we pretend to range and determine them exactly into species, according to internal essential differences.

§ 21. *But such a collection as our name stands for.*—But since as has been remarked, we have need of general words, though we know not the real essences of things; all we can do, is to collect such a number of simple ideas, as, by examination, we find to be united together in things existing, and thereof to make one complex idea. Which, though it be not the real essence of any substance that exists, is yet the specific essence to which our name belongs, and is convertible with it; by which we may, at least, try the truth of these nominal essences. For example, there be that say, that the essence of body is extension; if it

be so, we can never mistake in putting the essence of any thing for the thing itself. Let us then, in discourse, put extension for body; and when we would say, that body moves, let us say that extension moves, and see how ill it will look. He that should say, that one extension by impulse moves another extension, would, by the bare expression, sufficiently shew the absurdity of such a notion. The essence of any thing in respect of us, is the whole complex idea, comprehended and marked by that name; and in substances, besides the several distinct simple ideas that make them up, the confused one of substance, or of an unknown support and cause of their union, is always a part; and, therefore, the essence of body is not bare extension, but an extended solid thing: and so to say, an extended solid thing moves, or impels another, is all one, and as intelligible, as to say, body moves, or impels. Likewise, to say, that a rational animal is capable of conversation, is all one, as to say, a man. But no one will say that rationality is capable of conversation, because it makes not the whole essence to which we give the name man.

§ 22. *Our abstract ideas are to us the measure of species: instance in that of man.*—There are creatures in the world, that have shapes like ours, but are hairy, and want language and reason. There are naturals amongst us, that have perfectly our shape, but want reason, and some of them language too. There are creatures, as it is said (*sit fides penes authorem*, but there appears no contradiction that there should be such), that with language and reason, and a shape in other things agreeing with ours, have hairy tails; others, where the males have no beards, and others where the females have. If it be asked, whether these be all men or no, all of human species; it is plain, the question refers only to the nominal essence; for those of them to whom the definition of the word man, or the complex idea signified by that name, agrees, are men, and the other not. But if the inquiry be made concerning the supposed real essence, and whether the internal constitution and frame of these several creatures be specifically different, it is wholly impossible for us to answer, no part of that going into our specific ideas; only we have reason to think, that where the faculties, or outward frame, so much differs, the internal constitution is not exactly the same; but what difference, in the internal real constitution makes a specific difference, it is in vain to inquire; whilst our measures of species be, as they are, only our abstract ideas, which we know; and not that internal constitution, which makes no part of them. Shall the difference of hair only on the skin, be a mark of a different internal specific constitution between a changeling and a drill, when they agree in shape, and want of reason and speech? And shall not the want of reason and speech be a sign to us of different real constitutions and species between a changeling and a reasonable man? And so of the rest, if we pretend that distinction of species or sort, is fixedly established by the real frame, and secret constitutions, of things.

§ 23. *Species not distinguished by generation.*—Nor let any one say, that the power of propagation in animals, by the mixture of male and female, and in plants, by seeds, keeps the supposed real species dis-

inct and entire. For granting this to be true, it would help us in the distinction of the species of things, no farther than the tribes of animals and vegetables. What must we do for the rest? But in those too it is not sufficient: for if history lie not, women have conceived by drills; and what real species, by that measure, such a production will be in nature, will be a new question; and we have reason to think, that this is not impossible, since mules and jumarts, the one from the mixture of an ass and a mare, the other from the mixture of a bull and a mare, are so frequent in the world. I once saw a creature that was the issue of a cat and a rat, and had the plain marks of both about it; wherein nature appeared to have followed the pattern of neither sort alone, but to have jumbled them both together. To which, he that shall add the monstrous productions that are so frequently to be met with in nature, will find it hard even in the race of animals, to determine by the pedigree of what species every animal's issue is; and be at a loss about the real essence, which he thinks certainly conveyed by generation, and has alone a right to the specific name. But farther, if the species of animals and plants are to be distinguished only by propagation, must I go to the Indies to see the sire and dam of the one, and the plant from which the seed was gathered that produced the other, to know whether this be a tiger, or that, tea?

§ 24. *Not by substantial forms.*—Upon the whole matter, it is evident, that it is their own collections of sensible qualities, that men make the essences of their several sorts of substances; and that their real internal structures are not considered by the greatest part of men, in the sorting them. Much less were any substantial forms ever thought on by any, but those who have in this one part of the world, learned the language of the schools; and yet those ignorant men, who pretend not any insight into the real essences, nor trouble themselves about substantial forms, but are content with knowing things one from another, by their sensible qualities, are often better acquainted with their differences, can more nicely distinguish them from their uses, and better know what they expect from each, than those learned quick-sighted men, who look so deep into them, and talk so confidently of something more hidden and essential.

§ 25. *The specific essences are made by the mind.*—But supposing that the real essences of substances were discoverable by those that would severally apply themselves to that inquiry; yet we could not reasonably think, that the ranking of things under general names, was regulated by those internal real constitutions, or any thing else, but their obvious appearances; since languages, in all countries, have been established long before sciences. So that they have not been philosophers, or logicians, or such who have troubled themselves about forms and essences, that have made the general names that are in use amongst the several nations of men; but those more or less comprehensive terms, have, for the most part, in all languages, received their birth and signification from ignorant and illiterate people, who sorted and denominated things, by those sensible qualities they found in them, thereby to signify them, when absent, to others, whether they had an occasion to mention a sort, or a particular thing.

§ 26. *Therefore very various and uncertain.*—Since, then, it is evident, that we sort and name substances by their nominal, and not by their real, essences; the next thing to be considered is, how, and by whom, these essences come to be made. As to the latter, it is evident they are made by the mind, and not by nature; for were they nature's workmanship, they could not be so various and different in several men, as experience tells us they are. For if we will examine it, we shall not find the nominal essence of any one species of substances, in all men the same; no not of that, which, of all others, we are the most intimately acquainted with. It could not possibly be, that the abstract idea, to which the name man is given, should be different in several men, if it were of nature's making; and that to one it should be *animal rationale*, and to another, *animal implume bipes latis unguibus*. He that annexes the name man to a complex idea, made up of sense and spontaneous motion, joined to a body of such a shape, has, thereby, one essence of the species man; and he that, upon farther examination, adds rationality, has another essence of the species he calls man; by which means, the same individual will be a true man to the one, which is not so to the other. I think, there is scarce any one will allow this upright figure, so well known, to be the essential difference of the species man; and yet how far men determine of the sorts of animals, rather by their shape than descent, is very visible; since it has been more than once debated, whether several human foetuses should be preserved, or received to baptism, or no, only because of the difference of their outward configuration, from the ordinary make of children, without knowing whether they were not as capable of reason, as infants cast in another mould; some whereof, though of an approved shape, are never capable of as much appearance of reason, all their lives, as is to be found in an ape or an elephant; and never give any signs of being actuated by a rational soul. Whereby it is evident, that the outward figure, which only was found wanting, and not the faculty of reason, which nobody could know would be wanting in its due season, was made essential to the human species. The learned divine and lawyer, must, on such occasions, renounce his sacred definition of *animal rationale*, and substitute some other essence of the human species. Monsieur Menage furnishes us with an example worth the taking notice of on this occasion. "When the Abbot of St. Martin," says he, "was born, he had so little of the figure of a man, that it bespake him rather a monster. It was for some time under deliberation, whether he should be baptized or no. However, he was baptized, and declared a man provisionally [till time should shew what he would prove]. Nature had moulded him so untowardly, that he was called all his life, the Abbot Malotru, i. e. ill-shaped. He was of Caen.—Menagiana $\frac{278}{430}$." This child, we see, was very near being excluded out of the species of man, barely by his shape. He escaped very narrowly as he was, and it is certain, a figure a little more oddly turned had cast him, and he had been executed, as a thing not to be allowed to pass for a man. And yet there can be no reason given, why, if the lineaments of his face had been a little altered, a rational soul could not have been lodged in him, why a visage somewhat longer, or a nose flatter, or a wider mouth, could not have

consisted, as well as the rest of his ill-figure, with such a soul, such parts, as made him, disfigured as he was, capable to be a dignitary in the church.

§ 27. Wherein, then, would I gladly know, consists the precise and unmoveable boundaries of that species? It is plain, if we examine, there is no such thing made by nature, and established by her amongst men. The real essence of that, or any other sort of substances, it is evident we know not; and therefore are so undetermined in our nominal essences, which we make ourselves, that if several men were to be asked, concerning some oddly shaped fœtus, as soon as born, whether it were a man, or no? it is past doubt, one should meet with different answers. Which could not happen, if the nominal essences, whereby we limit and distinguish the species of substances, were not made by man, with some liberty; but were exactly copied from precise boundaries set by nature, whereby it distinguished all substances into certain species. Who would undertake to resolve, what species that monster was of, which is mentioned by Licetus, lib. i. c. 3. with a man's head, and hog's body? Or those other, which to the bodies of men had the heads of beasts, as dogs, horses, &c. If any of these creatures had lived, and could have spoke, it would have increased the difficulty. Had the upper part, to the middle, been of human shape, and all below, swine; had it been murder to destroy it? Or must the bishop have been consulted, whether it were man enough to be admitted to the font, or no? as I have been told, it happened in France some years since, in somewhat a like case. So uncertain are the boundaries of species of animals, to us, who have no other measures than the complex ideas of our own collecting; and so far are we from certainly knowing what a man is; though, perhaps, it will be judged great ignorance to make any doubt about it. And yet, I think, I may say, that the certain boundaries of that species, are so far from being determined, and the precise number of simple ideas, which make the nominal essence, so far from being settled, and perfectly known, that very material doubts may still arise about it; and, I imagine, none of the definitions of the word man, which we yet have, nor descriptions of that sort of animal, are so perfect and exact, as to satisfy a considerate inquisitive person; much less to obtain a general consent, and to be that which men would every where stick by, in the decision of cases, and determining of life and death, baptism or no baptism, in productions that might happen.

§ 28. *But not so arbitrary as mixed modes.*—But though these nominal essences of substances are made by the mind, they are not yet made so arbitrarily as those of mixed modes. To the making of any nominal essence, it is necessary, *First*, That the ideas whereof it consists, have such a union as to make but one idea, how compounded soever. *Secondly*, That the particular ideas so united, be exactly the same, neither more nor less. For if two abstract complex ideas differ either in number of sorts of their component parts, they make two different, and not one and the same essence. In the first of these, the mind in making its complex ideas of substances, only follows nature; and puts none together, which are not supposed to have a union in nature. Nobody joins the voice of a sheep with the shape of a horse;

nor the colour of lead, with the weight and fixedness of gold, to be the complex ideas of any real substances ; unless he has a mind to fill his head with chimeras, and his discourse with unintelligible words. Men observing certain qualities always joined and existing together, therein copied nature ; and of ideas so united, made their complex ones of substances. For though men may make what complex ideas they please, and give what names to them they will ; yet if they will be understood, when they speak of things really existing, they must in some degree, conform their ideas to the things they would speak of ; or else men's language will be like that of Babel ; and every man's words being intelligible only to himself, would no longer serve to conversation, and the ordinary affairs of life, if the ideas they stand for be not some way answering the common appearances and agreement of substances, as they really exist.

§ 29. *Though very imperfect.*—*Secondly*, Though the mind of man, in making its complex ideas of substances, never puts any together that do not really, or are not supposed to, co-exist ; and so it truly borrows that union from nature ; yet the number it combines, depends upon the various care, industry, or fancy of him that makes it. Men generally content themselves with some few sensible obvious qualities ; and often, if not always, leave out others as material, and as firmly united, as those that they take. Of sensible substances, there are two sorts ; one of organized bodies, which are propagated by seed ; and in these, the shape is that, which to us is the leading quality, and most characteristical part, that determines the species ; and therefore in vegetables and animals, an extended solid substance of such a certain figure usually serves the turn. For however some men seem to prize their definition of *animal rationale*, yet should there a creature be found, that had language and reason, but partook not of the usual shape of a man, I believe it would hardly pass for a man, how much soever it were *animal rationale*. And if Balaam's ass had, all his life, discoursed as rationally as he did once with his master, I doubt yet, whether any one would have thought him worthy the name man, or allowed him to be of the same species with himself. As in vegetables and animals, it is the shape ; so in most other bodies, not propagated by seed, it is the colour we most fix on, and are most led by. Thus where we find the colour of gold, we are apt to imagine all the other qualities, comprehended in our complex idea, to be there also ; and we commonly take these two obvious qualities, viz. shape and colour, for so presumptive ideas of several species, that in a good picture, we readily say, this is a lion, and that a rose ; this is a gold, and that a silver, goblet, only by the different figures and colours represented to the eye by the pencil.

§ 30. *Which yet serve for common converse.*—But though this serves well enough for gross and confused conceptions, and inaccurate ways of talking and thinking ; yet men are far enough from having agreed on the precise number of simple ideas or qualities, belonging to any sort of things, signified by its name. Nor is it a wonder, since it requires much time, pains, and skill, strict inquiry, and long examination, to find out what, and how many, those simple ideas are,

which are constantly and inseparably united in nature, and are always to be found together in the same subject. Most men wanting either time, inclination, or industry, enough for this, even to some tolerable degree, content themselves with some few obvious and outward appearances of things, thereby readily to distinguish and sort them for the common affairs of life. And so, without farther examination, give them names, or take up the names already in use. Which, though in common conversation they pass well enough for the signs of some few obvious qualities co-existing, are yet far enough from comprehending, in a settled signification, a precise number of simple ideas; much less all those which are united in nature. He that shall consider, after so much stir about *genus* and *species*, and such a deal of talk of specific differences, how few words we have yet settled definitions of, may, with reason, imagine, that those forms, which there hath been so much noise made about, are only chimeras, which give us no light into the specific natures of things. And he that shall consider, how far the names of substances are from having significations, wherein all who use them do agree, will have reason to conclude, that though the nominal essences of substances are all supposed to be copied from nature, yet they are all, or most of them, very imperfect. Since the composition of those complex ideas are, in several men, very different; and, therefore, that these boundaries of species, are as men, and not as nature, makes them, if at least there are in nature any such prefixed bounds. It is true, that many particular substances are so made by nature, that they have agreement and likeness one with another, and so afford a foundation of being ranked into sorts. But the sorting of things by us, or the making of determinate species, being in order to naming and comprehending them under general terms, I cannot see how it can be properly said, that nature sets the boundaries of the species of things: or if it be so, our boundaries of species are not exactly conformable to those in nature. For we having need of general names for present use, stay not for a perfect discovery of all those qualities, which would best shew us their most material differences and agreements; but we ourselves divide them, by certain obvious appearances, into species, that we may the easier, under general names, communicate our thoughts about them. For having no other knowledge of any substance, but of the simple ideas that are united in it; and observing several particular things to agree with others, in several of those simple ideas, we make that collection our specific idea, and give it a general name; that in recording our thoughts, and in our discourse with others, we may in one short word design all the individuals that agree in that complex idea, without enumerating the simple ideas that make it up; and so not waste our time and breath in tedious descriptions; which we see they are fain to do, who would discourse of any new sort of things they have not yet a name for.

§ 31. *Essences of species under the same name, very different.*—But, however, these species of substances pass well enough in ordinary conversation, it is plain, that this complex idea, wherein they observe several individuals to agree, is, by different men, made very differently; by some more, and others less, accurately. In some, this complex

idea contains a greater, and in others, a smaller, number of qualities : and so is apparently such as the mind makes it. The yellow shining colour makes gold to children ; others add weight, malleableness, and fusibility ; and others, yet other qualities, which they find joined with that yellow colour, as constantly as its weight and fusibility : for in all these and the like qualities, one has as good a right to be put into the complex idea of that substance, wherein they are all joined, as another. And therefore different men leaving out, or putting in, several simple ideas, which others do not, according to their various examination, skill, or observation of that subject, have different essences of gold ; which must therefore be of their own, and not of nature's, making.

§ 32. *The more general our ideas are, the more incomplete and partial they are.*—If the number of simple ideas that make the nominal essence of the lowest species, or first sorting of individuals, depends on the mind of man, variously collecting them, it is much more evident that they do so, in the more comprehensive *classis*, which, by the masters of logic, are called *genera*. These are complex ideas designedly imperfect : and it is visible at first sight, that several of those qualities, that are to be found in the things themselves, are purposely left out of generical ideas. For as the mind, to make general ideas, comprehending several particulars, leaves out those of time and place, and such other that make them incommunicable to more than one individual ; so to make other yet more general ideas, that may comprehend different sorts, it leaves out those qualities that distinguish them, and puts into its new collection, only such ideas as are common to several sorts. The same convenience that made men express several parcels of yellow matter coming from Guinea and Peru, under one name, sets them also upon making of one name, that may comprehend both gold and silver, and some other bodies of different sorts. This is done by leaving out those qualities which are peculiar to each sort ; and retaining a complex idea made up of those that are common to them all. To which the name metal being annexed, there is a *genus* constituted ; the essence whereof being that abstract idea containing only malleableness and fusibility, with certain degrees of weight and fixedness, wherein some bodies of several kinds agree, leaves out the colour and other qualities peculiar to gold and silver, and the other sorts comprehended under the name metal. Whereby it is plain, that men follow not exactly the patterns set them by nature, when they make their general ideas of substances ; since there is no body to be found, which has barely malleableness and fusibility in it, without other qualities inseparable as those. But men, in making their general ideas, seeing more the convenience of language and quick dispatch, by short and comprehensive signs, than the true and precise nature of things, as they exist, have, in the framing their abstract ideas, chiefly pursued that end which was to be furnished with store of general and variously comprehensive names. So that in this whole business of *genera* and species the *genus*, or more comprehensive, is but a partial conception of what is in the species, and the species but a partial idea of what is to be found in each individual. If, therefore, any one will think, that a man and a horse, and an animal and a plant, &c. are distinguished by rea-

essences made by nature, he must think nature to be very liberal of these real essences, making one for body, another for an animal, and another for a horse; and all these essences liberally bestowed upon Bucephalus. But if we would rightly consider what is done, in all these *genera* and species or sorts, we should find, that there is no new thing made, but only more or less comprehensive signs, whereby we may be enabled to express, in a few syllables, great numbers of particular things, as they agree in more or less general conceptions, which we have framed to that purpose. In all which, we may observe, that the more general term, is always the name of a less complex idea; and that each *genus* is but a partial conception of the species comprehended under it. So that if these abstract general ideas be thought to be complete, it can only be in respect of a certain established relation between them and certain names, which are made use of to signify them; and not in respect of any thing existing, as made by nature.

§ 33. *This all accommodated to the end of speech.*—This is adjusted to the true end of speech, which is to be the easiest and shortest way of communicating our notions. For thus, he that would discourse of things, as they agreed in the complex ideas of extension and solidity, needed but use the word body, to denote all such. He that to these would join others, signified by the words life, sense, and spontaneous motion, needed but use the word animal, to signify all which partook of those ideas: and he that had made a complex idea of a body, with life, sense, and motion, with the faculty of reasoning, and a certain shape joined to it, needed but use the short monosyllable man, to express all particulars that correspond to that complex idea. This is the proper business of *genus* and *species*; and this men do, without any consideration of real essences or substantial forms, which come not within the reach of our knowledge, when we think of those things; nor within the signification of our words, when we discourse with others.

§ 34. *Instance in cassuaris.*—Were I to talk with any one of a sort of birds I lately saw in St. James's Park, about three or four feet high, with a covering of something between feathers and hair, of a dark brown colour, without wings, but in the place thereof, two or three little branches, coming down like sprigs of Spanish broom; long great legs, with feet only of three claws, and without a tail; I must make this description of it, and so may make others understand me: but when I am told, that the name of it is *cassuaris*, I may then use that word to stand in discourse for all my complex idea mentioned in that description; though by that word, which is now become a specific name, I know no more of the real essence, or constitution, of that sort of animals, than I did before; and knew probably as much of the nature of that species of birds, before I learned the name, as many Englishmen do of swans, or herons, which are specific names, very well known of sorts of birds common in England.

§ 35. *Men determine the sorts.*—From what has been said, it is evident, that men make sorts of things. For it being different essences alone that make different species, it is plain that they who make those

abstract ideas, which are the nominal essences, do thereby make the species, or sort. Should there be a body found, having all the other qualities of gold, except malleableness, it would, no doubt, be made a question whether it were gold or no; i. e. whether it were of that species. This could be determined only by that abstract idea, to which every one annexed the name gold; so that it would be true gold to him, and be long to that species, who included not malleableness in his nominal essence, signified by the sound gold; and on the other side, it would not be true gold, or of that species, to him, who included malleableness in his specific idea. And who, I pray, is it, that makes these diverse species, even under one and the same name, but men that make two different abstract ideas, consisting not exactly of the same collection of qualities? Nor is it a mere supposition to imagine, that a body may exist, wherein the other obvious qualities of gold may be without malleableness; since it is certain, that gold itself will be sometimes so eager (as artists call it), that it will as little endure the hammer, as glass itself. What we have said of the putting in, or leaving malleableness out, of the complex idea the name gold is by any one annexed to, may be said of its peculiar weight, fixedness, and several other the like qualities: for whatsoever is left out, or put in, it is still the complex idea, to which that name is annexed, that makes the species: and as any particular parcel of matter answers that idea, so the name of the sort belongs truly to it; and it is of that species. And thus any thing is true gold, perfect metal. All which determination of the species, it is plain, depends on the understanding of man, making this or that complex idea.

§ 36. *Nature makes the similitude.*—This then, in short, is the case; nature makes many particular things which do agree one with another, in many sensible qualities, and probably too, in their internal frame and constitution: but it is not this real essence that distinguishes them into species; it is men, who taking occasion from the qualities they find united in them, and wherein they observe often several individuals to agree, range them into sorts, in order to their naming, for the convenience of comprehensive signs; under which individuals, according to their conformity to this or that abstract idea, come to be ranked, as under ensigns; so that this is of the blue, that of the red regiment: this is a man, that a drill: and in this, I think, consists the whole business of *genus* and *species*.

§ 37. I do not deny, but nature, in the constant production of particular beings, makes them not always new and various, but very much alike, and of kin, one to another: but I think it nevertheless true, that the boundaries of the species, whereby men sort them, are made by men; since the essences of the species, distinguished by different names, are, as has been proved, of man's making, and seldom adequate to the internal nature of the things they are taken from. So that we may truly say, such a manner of sorting of things is the workmanship of men.

§ 38. *Each abstract idea is an essence.*—One thing I doubt not but will seem very strange in this doctrine: which is, that from what has been said, it will follow, that each abstract idea, with a name to it, make

a distinct species. But who can help it, if truth will have it so? For so it must remain, till somebody can shew us the species of things limited and distinguished by something else: and let us see, that general terms signify not our abstract ideas, but something different from them. I would fain know, why a shock and a hound, are not as distinct species, as a spaniel and an elephant? We have no other idea of the different essence of an elephant and a spaniel, than we have of the different essence of a shock and a hound; all the essential difference, whereby we know and distinguish them one from another, consisting only in the different collection of simple ideas, to which we have given those different names.

§ 39. *Genera and species are in order to naming.*—How much the making of *species* and *genera* is in order to general names, and how much general names are necessary, if not to the being, yet at least to the completing, of a species, and making it pass for such, will appear, besides what has been said above, concerning ice and water, in a very familiar example. A silent and a striking watch, are but one species, to those who have but one name for them: but he that has the name watch for one, and clock for the other, and distinct complex ideas, to which those names belong, to him they are different species. It will be said, perhaps, that the inward contrivance and constitution is different between these two, which the watchmaker has a clear idea of. And yet, it is plain, they are but one species to him, when he has but one name for them. For what is sufficient in the inward contrivance to make a new species? There are some watches that are made with four wheels, others with five: is this a specific difference to the workman? Some have strings and physies, and others none; some have the balance loose, and others regulated by a spiral spring, and others by hogs' bristles: are any, or all of these, enough to make a specific difference to the workman, that knows each for these, and several other different contrivances, in the internal constitution of watches? It is certain, each of these hath a real difference from the rest: but whether it be an essential, a specific difference, or no, relates only to the complex idea to which the name watch is given: as long as they all agree in the idea which that name stands for, and that name does not as a generical name comprehend different species under it, they are not essentially nor specifically different. But if any one will make minuter divisions from differences that he knows in the internal frame of watches, and to such precise complex ideas, give names that shall prevail, they will then be new species to them, who have those ideas with names to them; and can, by those differences, distinguish watches into these several sorts, and then watch will be a generical name. But yet they would be no distinct species to men ignorant of clockwork, and the inward contrivance of watches, who had no other idea but the outward shape and bulk, with the marking of the hours by the hand. For to them, all those other names would be but synonymous terms for the same idea, and signify no more, nor no other thing, but a watch. Just thus, I think, it is in natural things. Nobody will doubt, that the wheels or springs (if I may so say) within, are different in a rational man and a changeling, no more than that there is a difference in the frame between a drill and a

changing. But whether one or both these differences be essential or specific, is only to be known to us, by their agreement or disagreement with the complex idea that the name man stands for: for by that alone can it be determined, whether one, or both, or neither of those, be a man, or no.

§ 40. *Species of artificial things less confused than natural.*—From what has been before said, we may see the reason why, in the species of artificial things, there is generally less confusion and uncertainty, than in natural. Because an artificial thing being a production of man, which the artificer designed, and, therefore, well knows the idea of, the name of it is supposed to stand for no other idea, nor to import any other essence, than what is certainly to be known, and easy enough to be apprehended. For the idea, or essence, of the several sorts of artificial things, consisting, for the most part, in nothing but the determinate figure of sensible parts: and sometimes motion depending thereon, which the artificer fashions in matter, such as he finds for his turn, it is not beyond the reach of our faculties to attain a certain idea thereof; and to settle the signification of the names whereby the species of artificial things are distinguished, with less doubt, obscurity, and equivocation, than we can in things natural, whose differences and operations depend upon contrivances beyond the reach of our discoveries.

§ 41. *Artificial things of distinct species.*—I must be excused here, if I think artificial things are of distinct species, as well as natural; since I find they are as plainly and orderly ranked into sorts, by different abstract ideas, with general names annexed to them, as distinct one from another as those of natural substances. For why should we not think a watch and pistol, as distinct species one from another, as a horse and a dog, they being expressed in our minds by distinct ideas, and to others by distinct appellations?

§ 42. *Substances alone have proper names.*—This is farther to be observed concerning substances, that they alone, of all our several sorts of ideas, have particular or proper names, whereby one only particular thing is signified. Because, in simple ideas, modes, and relations, it seldom happens that men have occasion to mention often this or that particular, when it is absent. Besides, the greatest part of mixed modes, being actions which perish in their birth, are not capable of lasting duration, as substances, which are the actors; and wherein the simple ideas, that make up the complex idea designed by the name, have a lasting union.

§ 43. *Difficulty to treat of words.*—I must beg pardon of my reader, for having dwelt so long upon this subject, and perhaps with some obscurity. But I desire it may be considered, how difficult it is, to lead another by words into the thoughts of things, stripped of those specific differences we give them; which things, if I name not, I say nothing; and if I do name them, I thereby rank them into some sort or other, and suggest to the mind the usual abstract idea of that species, and so cross my purpose. For to talk of a man, and to lay by, at the same time, the ordinary signification of the name man, which is our complex idea, usually annexed to it; and bid the reader consider man, as he is himself, and as he is really distinguished from others, in his

internal constitution, or real essence, that is, by something, he knows not what, looks like trifling; and yet thus one must do, who would speak of the supposed real essences and species of things, as thought to be made by nature, if it be but only to make it understood, that there is no such thing signified by the general names which substances are called by. But because it is difficult by known familiar names to do this, give me leave to endeavour by an example, to make the different consideration the mind has of specific names and ideas, a little more clear; and to shew how the complex ideas of modes are referred sometimes to archetypes in the minds of other intelligent beings: or, which is the same, to the signification annexed by others to their received names; and sometimes to no archetypes at all. Give me leave also to shew how the mind always refers its ideas of substances, either to the substances themselves, or to the signification of their names, as to the archetypes; and also to make plain the nature of species, or sorting of things, as apprehended, and made use of, by us; and of the essences belonging to those species, which is, perhaps, of more moment, to discover the extent and certainty of our knowledge, than we at first imagine.

§ 44. *Instances of mixed modes in kinneah and niouph.*—Let us suppose Adam in the state of a grown man, with a good understanding, but in a strange country, with all things new and unknown about him; and no other faculties to attain the knowledge of them, but what one of this age has now. He observes Lamech more melancholy than usual, and imagines it to be from a suspicion he has of his wife Adah (whom he most ardently loved), that she had too much kindness for another man. Adam discourses these his thoughts to Eve, and desires her to take care that Adah commits not folly; and in these discourses with Eve, he makes use of these two new words, *kinneah* and *niouph*. In time, Adam's mistake appears, for he finds Lamech's trouble proceeded from having killed a man; but yet the two names, *kinneah* and *niouph*, the one standing for suspicion, in a husband, of his wife's disloyalty to him, and the other, for the act of committing disloyalty, lost not their distinct significations. It is plain, then, that here were two distinct complex ideas of mixed modes, with names to them; two distinct species of actions, essentially different; I ask, wherein consisted the essences of these two distinct species of actions? and it is plain, it consisted in a precise combination of simple ideas, different in one from the other. I ask, whether the complex idea in Adam's mind, which he called *kinneah*, were adequate or no? And it is plain it was; for it being a combination of simple ideas, which he, without any regard to any archetype, without respect to any thing as a pattern, voluntarily put together, abstracted, and gave the name *kinneah* to, to express in short to others, by that one sound, all the simple ideas contained and united in that complex one; it must necessarily follow, that it was an adequate idea. His own choice having made that combination, it had all in it he intended it should, and so could not but be perfect, could not but be adequate, it being referred to no other archetype, which it was supposed to represent.

§ 45. These words, *kinneah* and *niouph*, by degrees grew into com-

mon use ; and then the case was somewhat altered. Adam's children had the same faculties, and thereby the same power that he had, to make what complex ideas of mixed modes they pleased in their own minds ; to abstract them, and make what sounds they pleased, the signs of them ; but the use of names being to make our ideas within us known to others, that cannot be done, but when the same sign stands for the same idea in two, who would communicate their thoughts, and discourse together. Those, therefore, of Adam's children that found these two words, *kinneah* and *niouph*, in familiar use, could not take them for insignificant sounds ; but must needs conclude, they stood for something, for certain ideas, abstract ideas, they being general names, which abstract ideas were the essences of the species distinguished by those names. If therefore, they would use these words as names of species already established and agreed on, they were obliged to conform the ideas in their minds, signified by these names, to the ideas that they stood for in other men's minds, as to their patterns and archetypes ; and then, indeed, their ideas of these complex modes were liable to be inadequate, as being very apt (especially those that consisted of combinations of many simple ideas) not to be exactly conformable to the ideas in other men's minds, using the same names ; though for this, there be usually a remedy at hand, which is, to ask the meaning of any word we understand not, of him that uses it ; it being as impossible to know certainly what the words jealousy and adultery (which I think answer קנאות and נאור) stand for in another man's mind, with whom I would discourse about them ; as it was impossible, in the beginning of language, to know what *kinneah* and *niouph* stood for in another man's mind, without explication, they being voluntary signs in every one.

§ 46. *Instance of substances in zahab.*—Let us now also consider, after the same manner, the names of substances, in their first application. One of Adam's children, roving in the mountains, lights on a glittering substance, which pleases his eye ; home he carries it to Adam, who, upon consideration of it, finds it to be hard, to have a bright yellow colour, and an exceeding great weight. These, perhaps, at first, are all the qualities he takes notice of in it, and abstracting this complex idea, consisting of a substance having that peculiar bright yellowness, and a weight very great in proportion to its bulk, he gives it the name *zahab*, to denominate and mark all substances that have these sensible qualities in them. It is evident now, that in this case, Adam acts quite differently from what he did before, in forming those ideas of mixed modes, to which he gave the names *kinneah* and *niouph*. For there he puts ideas together, only by his own imagination, not taken from the existence of any thing ; and to them he gave names to denominate all things that should happen to agree to those his abstract ideas, without considering whether any such thing did exist, or no ; the standard there was of his own making. But in the forming his idea of this new substance, he takes the quite contrary course ; here he has a standard made by nature, and therefore being to represent that to himself, by the idea he has of it, even when it is absent, he puts in no simple idea into his complex one, but what he has the perception of from the thing itself. He takes care that his idea be conformable to this

archetype, and intends the name should stand for an idea so conformable.

§ 47. This piece of matter, thus denominated zahab by Adam, being quite different from any he had seen before, nobody, I think, will deny to be a distinct species, and to have its peculiar essence: and that the name zahab has the mark of the species, and a name belonging to all things partaking in that essence. But here, it is plain, the essence Adam made the name zahab stand for, was nothing but a body hard, shining, yellow, and very heavy. But the inquisitive mind of man, not content with the knowledge of these, as I may say, superficial qualities, puts Adam on farther examination of this matter. He therefore knocks and beats it with flints, to see what was discoverable in the inside: he finds it yield to blows, but not easily separate into pieces; he finds it will bend without breaking. Is not now ductility to be added to his former idea, and made part of the essence of the species that name zahab stands for? Farther trials discover fusibility and fixedness. Are not they also, by the same reason that any of the others were, to be put into the complex idea signified by the name zahab? If not, what reason will there be shewn more for the one than the other? If these must, then all the other properties, which any farther trials shall discover in this matter, ought, by the same reason, to make a part of the ingredients of the complex idea which the name zahab stands for, and so be the essence of the species marked by that name. Which properties, because they are endless, it is plain, that the idea made after this fashion by this archetype, will be always inadequate.

§ 48. *Their ideas imperfect, and therefore various.*—But this is not all; it would also follow, that the names of substances would not only have (as in truth they have), but would also be supposed to have different significations, as used by different men, which would very much cumber the use of language. For if every distinct quality, that were discovered in any matter by any one, were supposed to make a necessary part of the complex idea signified by the common name given it, it must follow, that men must suppose the same word to signify different things in different men: since they cannot doubt but different men may have discovered several qualities in substances of the same denomination, which others know nothing of.

§ 49. *Therefore to fix their species, a real essence is supposed.*—To avoid this, therefore, they have supposed a real essence belonging to every species from which these properties all flow, and would have their name of the species stand for that. But they not having any idea of that real essence, in substances, and their words signifying nothing but the ideas they have, that which is done by this attempt, is only to put the name or sound in the place and stead of the thing having that real essence, without knowing what the real essence is; and this is that which men do, when they speak of species of things, as supposing them made by nature, and distinguished by real essences.

§ 50. *Which supposition is of no use.*—For let us consider when we affirm, that all gold is fixed, either it means that fixedness is a part of the definition, part of the nominal essence, the word gold stands for; and so this affirmation, all gold is fixed, contains nothing but the signi-

fication of the term gold. Or else it means, that fixedness not being a part of the definition of the word gold, is a property of that substance itself; in which case, it is plain, that the word gold stands in the place of a substance, having the real essence of a species of things, made by nature. In which way of substitution, it has so confused and uncertain a signification, that though this proposition, gold is fixed, be in that sense an affirmation of something real; yet it is a truth will always fail us in its particular application, and so is of no real use nor certainty. For let it be ever so true, that all gold, i. e. all that has the real essence of gold, is fixed, what serves this for, whilst we know not in this sense, what is, or is not, gold; for if we know not the real essence of gold, it is impossible we should know what parcel of matter has that essence, and so whether it be true gold or no.

§ 51. *Conclusion.*—To conclude; what liberty Adam had at first to make any complex idea of mixed modes, by no other patterns but his own thoughts, the same have all men ever since had. And the same necessity of conforming his ideas of substances to things without him, as to archetypes, made by nature, that Adam was under, if he would not wilfully impose upon himself, the same are all men ever since under too. The same liberty also, that Adam had of affixing any new name to any idea, the same has any one still (especially the beginners of languages, if we can imagine any such), but only with this difference, that in places where men in society have already established a language amongst them, the significations of words are very warily and sparingly to be altered. Because men being furnished already with names for their ideas, and common use having appropriated known names to certain ideas, an affected misapplication of them cannot but be very ridiculous. He that hath new notions, will, perhaps venture sometimes on the coining of new terms to express them; but men think it a boldness, and it is uncertain, whether common use will ever make them pass for current. But in communication with others, it is necessary that we conform the ideas we make the vulgar words of any language stand for to their known proper significations (which I have explained at large already), or else to make known that new signification we apply them to.

C H A P. VII.

OF PARTICLES.

§ 1. *Particles connect parts or whole sentences together.*—Besides words, which are names of ideas in the mind, there are a great many others that are made use of, to signify the connexion that the mind gives to ideas or propositions one with another. The mind, in communicating its thought to others, does not only need signs of the ideas it has then before it, but others also, to shew, or intimate some particular action of its own, at that time, relating to those ideas. This it does several ways; as, is, and is not, are the general marks of the mind affirming or denying. But besides affirmation, or negation, without which there is in words no truth or falsehood, the mind does, in declaring its sentiments to others, connect not only the parts of propositions, but whole sen-

tences one to another, with their several relations and dependencies, to make a coherent discourse.

§ 2. *In them consists the art of well speaking.*—The words, whereby it signifies what connexion it gives to the several affirmations and negations that it unites in one continued reasoning or narration, are generally called particles; and it is in the right use of these, that more particularly consists the clearness and beauty of a good style. To think well, it is not enough that a man has ideas clear and distinct in his thoughts, nor that he observes the agreement, or disagreement, of some of them: but he must think in train, and observe the dependence of his thoughts and reasonings upon one another; and to express well such methodical and rational thoughts, he must have words to shew what connexion, restriction, distinction, opposition, emphasis, &c. he gives to each respective part of his discourse. To mistake in any of these, is to puzzle, instead of informing, his hearer; and therefore it is, that those words, which are not truly, by themselves, the names of any ideas, are of such constant and indispensable use in language, and do much contribute to men's well expressing themselves.

§ 3. *They shew what relation the mind gives to its own thoughts.*—This part of grammar has been, perhaps, as much neglected, as some others over diligently cultivated. It is easy for men to write one after another, of cases and genders, moods and tenses, gerunds and supines: in these, and the like, there has been great diligence used; and particles themselves, in some languages, have been, with great show of exactness, ranked into their several orders. But though prepositions and conjunctions, &c. are names well known in grammar, and the particles contained under them carefully ranked into their distinct subdivisions; yet he who would shew the right use of particles, and what significancy and force they have, must take a little more pains, enter into his own thoughts, and observe nicely the several postures of his mind in discoursing.

§ 4. Neither is it enough, for the explaining of these words, to render them, as is usual in dictionaries, by words of another tongue which come nearest to their signification; for what is meant by them, is commonly as hard to be understood in one, as another, language. They are all marks of some action or intimation of the mind; and, therefore, to understand them rightly, the several views, postures, stands, turns, limitations, and exceptions, and several other thoughts of the mind, for which we have either none, or very deficient, names, are diligently to be studied. Of these, there are a great variety, much exceeding the number of particles that most languages have to express them by; and, therefore, it is not to be wondered, that most of these particles have divers, and sometimes almost opposite, significations. In the Hebrew tongue, there is a particle consisting but of one single letter, of which there are reckoned up, as I remember, seventy, I am sure above fifty, several significations.

§ 5. *Instance in but.*—But, is a particle, none more familiar in our language; and he that says it is a discretive conjunction, and that it answers *sed* in Latin, or *mais* in French, thinks he has sufficiently explained it. But it seems to me to intimate several relations the mind

gives to the several propositions or parts of them, which it joins by this monosyllable.

First, "But to say no more;" here it intimates a stop of the mind, in the course it was going, before it came quite to the end of it.

Secondly, "I saw but two plants:" here it shews, that the mind limits the sense to what is expressed, with a negation of all other.

Thirdly, "You pray: but it is not that God would bring you to the true religion."

Fourthly, "But that he would confirm you in your own:" the first of these *buts* intimates a supposition in the mind of something otherwise than it should be; the latter shews, that the mind makes a direct opposition between that, and what goes before it.

Fifthly, "All animals have sense; but a dog is an animal:" here it signifies little more, but that the latter proposition is joined to the former, as the minor of a syllogism.

§ 6. To these, I doubt not, might be added a great many other significations of this particle, if it were my business to examine it in its full latitude, and consider it in all the places it is to be found: which if one should do, I doubt, whether in all those manners it is made use of, it would deserve the title of *discretive*, which grammarians give to it. But I intend not here a full explication of this sort of signs. The instances I have given in this one, may give occasion to reflect upon their use and force in language, and lead us into the contemplation of several actions of our minds in discoursing, which it has found a way to intimate to others by these particles, some whereof constantly, and others in certain constructions, have the sense of a whole sentence contained in them.

CHAP. VIII.

OF ABSTRACT AND CONCRETE TERMS.

§ 1. *Abstract terms not predicable one of another, and why.*—The ordinary words of language, and our common use of them, would have given us light into the nature of our ideas, if they had been but considered with attention. The mind, as has been shewn, has a power to abstract its ideas, and so they become essences, general essences, whereby the sorts of things are distinguished. Now each abstract idea being distinct, so that of any two, the one can never be the other, the mind will, by its intuitive knowledge, perceive their difference; and therefore in propositions, no two whole ideas can ever be affirmed one of another. This we see in the common use of language, which permits not any two abstract words, or names of abstract ideas, to be affirmed one of another. For how near of kin soever they may seem to be, and how certain soever it is, that man is an animal, or rational, or white, yet every one, at first hearing, perceives the falsehood of these propositions; humanity is animality, or rationality, or whiteness: and this is as evident as any of the most allowed maxims. All our affirmations, then, are only inconcrete, which is the affirming, not one abstract idea to be affirmed one of another, but one abstract idea to be joined to another; which abstract ideas, in substances, may be of any sort; in all the rest, are little else

but of relations; and in substances, the most frequent are of powers; v. g. a man is white, signifies, that the thing that has the essence of a man, has also in it the essence of whiteness, which is nothing but a power to produce the idea of whiteness in one, whose eyes can discover ordinary objects; or a man is rational, signifies, that the same thing that hath the essence of a man, hath also in it the essence of rationality, i. e. a power of reasoning.

§ 2. *They shew the difference of our ideas.*—This distinction of names, shews us also the difference of our ideas: for if we observe them, we shall find, that our simple ideas have all abstract, as well as concrete, names: the one whereof is (to speak the language of grammarians) a substantive, the other an adjective; as whiteness, white; sweetness, sweet. The like also holds in our ideas of modes and relations, as justice, just; equality, equal; only with this difference, that some of the concrete names of relations, amongst men, chiefly are substantives; as *paternitas, pater*; whereof it were easy to render a reason. But as to our ideas of substances, we have very few or no abstract names at all. For though the schools have introduced *animalitas, humanitas, corporietas*, and some others; yet they hold no proportion with that infinite number of names of substances, to which they never were ridiculous enough to attempt the coining of abstract ones: and those few that the schools forged, and put into the mouths of their scholars, could never yet get admittance into common use, or obtain the licence of public approbation. Which seems to me at least to intimate the confession of all mankind, that they have no ideas of the real essences of substances, since they have not names for such ideas: which no doubt they would have had, had not their consciousness to themselves of their ignorance of them, kept them from so idle an attempt. And therefore, though they had ideas enough to distinguish gold from a stone, and metal from wood; yet they but timorously ventured on such terms, as *aurietas* and *saxietas, metallietas* and *lignietas*, or the like names, which should pretend to signify the real essences of those substances, whereof they knew they had no ideas. And, indeed, it was only the doctrine of substantial forms, and the confidence of mistaking pretenders to a knowledge that they had not, which first coined, and then introduced, *animalitas*, and *humanitas*, and the like; which yet went very little farther than their own schools, and could never get to be current amongst understanding men. Indeed, *humanitas* was a word familiar amongst the Romans; but in a far different sense, and stood not for the abstract essence of any substance; but was the abstract name of a mode, and its concrete, *humanus*, not *homo*.

CHAP. IX.

OF THE IMPERFECTION OF WORDS.

§ 1. *Words are used for recording and communicating our thoughts.*
—From what has been said in the foregoing chapters, it is easy to perceive what imperfection there is in language, and how the very nature of words makes it almost unavoidable for many of them to be doubtful

and uncertain in their significations. To examine the perfection or imperfection of words, it is necessary first to consider their use and end : for as they are more or less fitted to attain that, so are they more or less perfect. We have in the former part of this discourse, often, upon occasion, mentioned a double use of words.

First, One for the recording of our own thoughts.

Secondly, The other for the communicating of our thoughts to others.

§ 2. *Any words will serve for recording.*—As to the first of these, for the recording our own thoughts for the help of our own memories, whereby, as it were, we talk to ourselves, any words will serve the turn. For since sounds are voluntary and indifferent signs of any ideas, a man may use what words he pleases, to signify his own ideas to himself : and there will be no imperfection in them, if he constantly use the same sign for the same idea, for then he cannot fail of having his meaning understood, wherein consists the right use and perfection of language.

§ 3. *Communication by words civil or philosophical.*—As to communication of words, that too has a double use : 1. civil ; 2. philosophical.

First, By their civil use, I mean such a communication of thoughts, and ideas by words, as may serve for the upholding common conversation and commerce about the ordinary affairs and conveniences of civil life, in the societies of men one amongst another.

Secondly, By the philosophical use of words, I mean such a use of them as may serve to convey the precise notion of things, and to express, in general propositions, certain and undoubted truths, which the mind may rest upon, and be satisfied with, in its search after true knowledge. These two uses are very distinct ; and a great deal less exactness will serve in the one, than in the other, as we shall see in what follows.

§ 4. *The imperfections of words, is the doubtfulness of their signification.*—The chief end of language in communication being understood, words serve not well for that end, neither in civil, nor philosophical, discourse, when any word does not excite in the hearer the same idea which it stands for in the mind of the speaker. Now since sounds have no natural connexion with our ideas, but have all their signification from the arbitrary imposition of men, the doubtfulness and uncertainty of their signification, which is the imperfection we here are speaking of, has its cause more in the ideas they stand for, than in any incapacity there is in one sound more than in another, to signify any idea : for in that regard they are all equally perfect.

That then which makes doubtfulness and uncertainty in the signification of some more than other words, is the difference of ideas they stand for.

§ 5. *Causes of their imperfection.*—Words having naturally no signification, the idea which each stands for, must be learned and retained by those who would exchange thoughts, and hold intelligible discourse with others, in any language. But this is hardest to be done, where,

First, The ideas they stand for are very complex, and made up of a great number of ideas put together.

Secondly, Where the ideas they stand for have no certain connexion in nature ; and so no settled standard any where in nature existing, to rectify and adjust them by.

Thirdly, When the signification of the word is referred to a standard, which standard is not easy to be known.

Fourthly, Where the signification of the word, and the real essence of the thing, are not exactly the same.

These are difficulties that attend the signification of several words that are intelligible. Those which are not intelligible at all, such as names standing for any simple ideas, which another has not organs or faculties to attain ; as the names of colours to a blind man, or sounds to a deaf man, need not here be mentioned.

In all these cases we shall find an imperfection in words, which I shall more at large explain, in their particular application to our several sorts of ideas : for if we examine them, we shall find, that the names of mixed modes are most liable to doubtfulness and imperfection for the two first of these reasons ; and the names of substances chiefly for the two latter.

§ 6. *The names of mixed modes doubtful: first, because the ideas they stand for, are so complex.*—*First*, The names of mixed modes, are many of them liable to great uncertainty and obscurity in their signification.

1. Because of that great composition these complex ideas are often made up of. To make words serviceable to the end of communication, it is necessary (as has been said) that they excite in the hearer, exactly the same idea they stand for in the mind of the speaker. Without this, men fill one another's heads with noise and sounds ; but convey not thereby their thoughts, and lay not before one another their ideas, which is the end of discourse and language. But when a word stands for a very complex idea, that is compounded and decomposed, it is not easy for men to form and retain that idea so exactly, as to make the name in common use stand for the same precise idea, without any the least variation. Hence it comes to pass, that men's names of very compound ideas, such as for the most part are moral words, have seldom in two different men the same precise signification, since one man's complex idea seldom agrees with another's, and often differs from his own, from that which he had yesterday, or will have to-morrow.

§ 7. *Secondly, because they have no standards.*—2. Because the names of mixed modes, for the most part, want standards in nature, whereby men may rectify and adjust their significations ; therefore they are very various and doubtful. They are assemblages of ideas put together at the pleasure of the mind, pursuing its own ends of discourse, and suited to its own notions, whereby it designs not to copy any thing really existing, but to denominate and rank things as they come to agree with those archetypes or forms it hath made. He that first brought the words sham, or weedle, or banter, in use, put together, as he thought fit, those ideas he made it stand for : and as it is with any new names of modes, that are now brought into any language ; so it was with the

old ones, when they were first made use of. Names, therefore, that stand for collections of ideas, which the mind makes at pleasure, must needs be of doubtful signification, when such collections are no where to be found constantly united in nature, nor any patterns to be shewn whereby men may adjust them. What the words murder, or sacrilege, &c. signifies, can never be known from things themselves; there be many of the parts of those complex ideas, which are not visible in the action itself, the intention of the mind, or the relation of holy things, which make a part of murder, or sacrilege, have no necessary connexion with the outward and visible action of him that commits either: and the pulling the trigger of the gun, with which the murder is committed, and is all the action that perhaps is visible, has no natural connexion with those other ideas that make up the complex one named murder. They have their union and combination only from the understanding, which unites them under one name: but uniting them without any rule, or pattern, it cannot be but that the signification of the name, that stands for such voluntary collections, should be often various in the minds of different men, who have scarce any standing rule to regulate themselves and their notions by, in such arbitrary ideas.

§ 8. *Propriety not a sufficient remedy.*—It is true, common use, that is the rule of propriety, may be supposed here to afford some aid, to settle the signification of language; and it cannot be denied, but that in some measure it does. Common use regulates the meaning of words pretty well for common conversation; but nobody having an authority to establish the precise signification of words, nor determine to what ideas any one shall annex them, common use is not sufficient to adjust them to philosophical discourses; there being scarce any name, of any very complex idea (to say nothing of others), which, in common use, has not a great latitude, and which keeping within the bounds of propriety, may not be made the sign of far different ideas. Besides, the rule and measure of propriety itself being no where established, it is often matter of dispute, whether this or that way of using a word, be propriety of speech, or no. From all which, it is evident, that the names of such kind of very complex ideas, are naturally liable to this imperfection, to be of doubtful and uncertain signification; and even in men that have a mind to understand one another, do not always stand for the same idea in speaker and hearer. Though the names glory and gratitude, be the same in every man's mouth through a whole country, yet the complex collective idea, which every one thinks on or intends by that name, is apparently very different in men using the same language.

§ 9. *The way of learning these names, contributes also to their doubtfulness.*—The way also wherein the names of mixed modes are ordinarily learned, does not a little contribute to the doubtfulness of their signification. For if we will observe how children learn languages, we shall find, that to make them understand what the names of simple ideas, or substances, stand for, people ordinarily shew them the thing whereof they would have them have the idea, and then repeat to them the name that stands for it, as white, sweet, milk, sugar, cat, dog. But as for mixed modes, especially the most material of them, moral words, the sounds are usually learned first, and then to know what complex ideas

they stand for, they are either beholden to the explication of others, or (which happens for the most part) are left to their own observation and industry; which being little laid out in the search of the true and precise meaning of names, these moral words are, in most men's mouths, little more than bare sounds; or when they have any, it is for the most part but a very loose and undetermined, and consequently obscure and confused, signification. And even those themselves, who have with more attention settled their notions, do yet hardly avoid the inconvenience, to have them stand for complex ideas, different from those which other, even intelligent and studious, men, make them the signs of. Where shall one find any, either controversial debate, or familiar discourse, concerning honour, faith, grace, religion, church, &c. wherein it is not easy to observe, the different notions men have of them? which is nothing but this, that they are not agreed in the signification of those words; nor have in their minds the same complex ideas which they make them stand for; and so all the contests that follow thereupon, are only about the meaning of a sound. And hence we see, that in the interpretation of laws, whether divine or human, there is no end; comments beget comments, and explications make new matter for explications; and of limiting, distinguishing, varying the signification of these moral words, there is no end. These ideas of men's making, are, by men still having the same power, multiplied *in infinitum*. Many a man, who was pretty well satisfied with the meaning of a text of Scripture, or clause in the code, at first reading, has, by consulting commentators, quite lost the sense of it, and by those elucidations, given rise or increase to his doubts, and drawn obscurity upon the place. I say not this, that I think commentaries needless; but to shew how uncertain the names of mixed modes naturally are, even in the mouths of those who had both the intention and the faculty of speaking as clearly as language was capable to express their thoughts.

§ 10. *Hence unavoidable obscurity in ancient authors.*—What obscurity this has unavoidably brought upon the writings of men, who have lived in remote ages, and different countries, it will be needless to take notice; since the numerous volumes of learned men, employing their thoughts that way, are proofs more than enough to shew what attention, study, sagacity, and reasoning, are required, to find out the true meaning of ancient authors. But there being no writings we have any great concernment to be very solicitous about the meaning of, but those that contain either truths we are required to believe, or laws we are to obey, and draw inconveniences on us when we mistake or transgress, we may be less anxious about the sense of other authors, who writing but their own opinions, we are under no greater necessity to know them, than they to know ours. Our good or evil depending not on their decrees, we may safely be ignorant of their notions; and therefore in the reading of them, if they do not use their words with a due clearness and perspicuity, we may lay them aside, and without any injury done them, resolve thus with ourselves:

“ Si non vis intelligi, debes negligi.”

§ 11. *Names of substances, of doubtful signification.*—If the signi-

fication of the names of mixed modes are uncertain, because there be no real standards existing in nature, to which those ideas are referred, and by which they may be adjusted, the names of substances are of a doubtful signification, for a contrary reason, viz. because the ideas they stand for are supposed conformable to the reality of things, and are referred to standards made by nature. In our ideas of substances we have not the liberty, as in mixed modes, to frame what combinations we think fit, to be the characteristical notes, to rank and denominate things by. In these we must follow nature, suit our complex ideas to real existences, and regulate the signification of their names by the things themselves, if we will have our names to be the signs of them, and stand for them. Here, it is true, we have patterns to follow: but patterns that will make the signification of their names very uncertain; for names must be of a very unsteady and various meaning, if the ideas they stand for be referred to standards without us, that either cannot be known at all, or can be known but imperfectly and uncertainly.

§ 12. *Names of substances referred, first, to real essences that cannot be known.*—The names of substances have, as has been shewn, a double reference in their ordinary use.

First, Sometimes they are made to stand for, and so their signification is supposed to agree to, the real constitution of things, from which all their properties flow, and in which they all centre. But this real constitution, or (as it is apt to be called) essence, being utterly unknown to us, any sound that is put to stand for it, must be very uncertain in its application; and it will be impossible to know what things are, or ought to be, called a horse or anatomy, when those words are put for real essences, that we have no ideas of at all. And, therefore, in this supposition, the names of substances being referred to standards that cannot be known, their significations can never be adjusted and established by those standards.

§ 13. *Secondly, to co-existing qualities, which are known but imperfectly.*—*Secondly,* The simple ideas that are found to co-exist in substances, being that which their names immediately signify, these, as united in the several sorts of things, are the proper standards to which their names are referred, and by which their significations may be best rectified. But neither will these archetypes so well serve to this purpose, as to leave these names, without very various and uncertain significations. Because these simple ideas that co-exist, and are united in the same subject, being very numerous, and having all an equal right to go into the complex specific idea, which the specific name is to stand for, men, though they propose to themselves the very same subject to consider, yet frame very different ideas about it: and so the name they use for it unavoidably comes to have, in several men, very different significations. The simple qualities which make up the complex ideas, being most of them powers, in relation to changes, which they are apt to make in, or receive from, other bodies, are almost infinite. He that shall but observe, what a great variety of alterations any one of the baser metals is apt to receive, from the different application only of fire; and how much a greater number of changes any one of them will receive in the hands of a chemist, by the application of other bodies,

will not think it strange, that I count the properties of any sort of bodies not easy to be collected, and completely known by the ways of inquiry, which our faculties are capable of. They being, therefore, at least, so many, that no man can know the precise and definite number, they are differently discovered by different men, according to their various skill, attention, and ways of handling; who, therefore, cannot choose, but have different ideas of the same substance, and therefore, make the signification of its common name very various and uncertain. For the complex ideas of substances, being made up of such simple ones as are supposed to co-exist in nature, every one has a right to put into his complex ideas, those qualities he has found to be united together. For though in the substance of gold, one satisfies himself with colour and weight, yet another thinks solubility in *aqua regia*, as necessary to be joined with that colour in his idea of gold, as any one does its fusibility; solubility in *aqua regia*, being a quality as constantly joined with its colour and weight, as fusibility, or any other; others put into it ductility or fixedness, &c. as they have been taught by tradition or experience. Who of all these has established the right signification of the word gold? Or who shall be the judge to determine? Each has his standard in nature, which he appeals to, and with reason thinks he has the same right to put into his complex idea signified by the word gold, those qualities, which upon trial, he has found united; as another, who has not so well examined, has to leave them out; or a third, who has made other trials, has to put in others. For the union in nature of these qualities, being the true ground of their union in one complex idea, who can say one of them has more reason to be put in, or left out, than another? From hence it will always unavoidably follow, that the complex ideas of substances in men using the same name for them, will be very various; and so the significations of those names, very uncertain.

§ 14. *Thirdly, to co-existing qualities which are known but imperfectly.*—Besides, there is scarce any particular thing existing, which, in some of its simple ideas, does not communicate with a greater, and in others, a less, number of particular beings: who shall determine in this case, which are those that are to make up the precise collection that is to be signified by the specific name? or can, with any just authority, prescribe, which obvious or common qualities are to be left out; or which more secret, or more particular, are to be put into the signification of the name of any substance? All which together, seldom or never fail to produce that various and doubtful signification in the names of substances, which causes such uncertainty, disputes, or mistakes, when we come to a philosophical use of them.

§ 15. *With this imperfection, they may serve for civil, but not well for philosophical, use.*—It is true, as to civil and common conversation, the general names of substances, regulated in their ordinary signification by some obvious qualities (as by the shape and figure in things of known seminal propagation, and, in other substances, for the most part by colour, joined with some other sensible qualities), do well enough to design the things men would be understood to speak of; and so they usually conceive well enough the substances meant by the word gold, or apple, to distinguish the one from the other. But in philosophical

inquiries and debates, where general truths are to be established, and consequences drawn from positions laid down, there the precise signification of the names of substances will be found, not only not to be well established, but also very hard to be so. For example, he that shall make malleableness, or a certain degree of fixedness, a part of his complex idea of gold, may make propositions concerning gold, and draw consequences from them, that will truly and clearly follow from gold, taken in such a signification; but yet such as another man can never be forced to admit, nor be convinced of their truth, who makes not malleableness, or the same degree of fixedness, part of that complex idea that the name gold, in his use of it, stands for.

§ 16. *Instance, liquor.*—This is a natural, and almost unavoidable imperfection in almost all the names of substances, in all languages whatsoever, which men will easily find, when once passing from confused or loose notions, they come to more strict and close inquiries. For then they will be convinced how doubtful and obscure those words are, in their signification, which in ordinary use appeared very clear and determined. I was once in a meeting of very learned and ingenious physicians, where, by chance, there arose a question, whether any liquor passed through the filaments of the nerves. The debate having been managed a good while, by variety of arguments on both sides, I (who had been used to suspect that the greatest part of disputes were more about the signification of words, than a real difference in the conception of things) desired, that before they went any farther on in this dispute, they would first examine, and establish among them, what the word liquor signified. They, at first, were a little surprised at the proposal; and had they been persons less ingenious, they might perhaps have taken it for a very frivolous or extravagant one; since there was no one there that thought not himself to understand very perfectly, what the word liquor stood for; which, I think, too, none of the most perplexed names of substances. However, they were pleased to comply with my motion, and, upon examination, found, that the signification of that word was not so settled and certain, as they had all imagined; but that each of them made it a sign of a different complex idea. This made them perceive, that the main of their dispute was about the signification of that term; and that they differed very little in their opinions, concerning some fluid and subtle matter, passing through the conduits of the nerves; though it was not so easy to agree, whether it was to be called liquor or no, a thing which, when considered, they thought it not worth the contending about.

§ 17. *Instance, gold.*—How much this is the case in the greatest part of disputes men are engaged so hotly in, I shall, perhaps, have an occasion in another place to take notice. Let us only, here, consider a little more exactly the fore-mentioned instance of the word gold, and we shall see how hard it is precisely to determine its signification. I think all agree to make it stand for a body of a certain yellow shining colour; which being the idea to which children have annexed that name, the shining yellow part of a peacock's tail, is properly to them gold. Others, finding fusibility joined with that yellow colour, in certain parcels of matter, make, of that combination, a complex idea, to which

they give the name gold, to denote a sort of substances; and so exclude from being gold, all such yellow shining bodies, as, by fire, will be reduced to ashes, and admit to be of that species, or to be comprehended under that name, gold, only such substances as having that shining yellow colour, will by fire, be reduced to fusion, and not to ashes. Another, by the same reason, adds the weight, which being a quality as straitly joined with that colour, as its fusibility, he thinks has the same reason to be joined in its idea, and to be signified by its name; and, therefore, the other made up of body, of such a colour and fusibility, to be imperfect; and so on of all the rest; wherein no one can shew a reason, why some of the inseparable qualities, which are always united in nature, should be put into the nominal essence, and others left out; or why the word gold, signifying that sort of body the ring on his finger is made of, should determine that sort, rather by its colour, weight, and fusibility, than by its colour, weight, and solubility in *aqua regia*; since the dissolving it by that liquor, is as inseparable from it, as the fusion by fire; and they are both of them nothing, but the relation which that substance has to two other bodies which have power to operate differently upon it. For, by what right is it, that fusibility comes to be a part of the essence signified by the word gold, and solubility but a property of it? Or why is its colour part of the essence, and its malleableness but a property? That which I mean, is this, that these being all but properties, depending on its real constitution; and nothing but powers, either active or passive, in reference to other bodies, no one has authority to determine the signification of the word gold (as referred to such a body existing in nature) more to one collection of ideas to be found in that body, than to another: whereby the signification of that name must unavoidably be very uncertain; since, as has been said, several people observe several properties in the same substance; and, I think, I may say, nobody at all. And, therefore, we have but very imperfect descriptions of things, and words have very uncertain significations.

§ 18. *The names of simple ideas the least doubtful.*—From what has been said, it is easy to observe what has been before remarked, viz. that the names of simple ideas are, of all others, the least liable to mistakes, and that for these reasons. *First*, Because the ideas they stand for, being each but one single perception, are much easier got, and more clearly retained, than the more complex ones, and, therefore, are not liable to the uncertainty which usually attends those compounded ones of substances and mixed modes, in which the precise number of simple ideas, that make them up, are not easily agreed, and so readily kept in the mind. And, *Secondly*, Because they are never referred to any other essence, but barely that perception they immediately signify; which reference is that which renders the signification of the names of substances naturally so perplexed, and gives occasion to so many disputes. Men that do not perversely use their words, or, on purpose, set themselves to cavil, seldom mistake in any language, which they are acquainted with, the use and signification of the names of simple ideas; white and sweet, yellow and bitter, carry a very obvious meaning with them, which every one precisely comprehends, or easily perceives he is ignorant of, and seeks to be informed. But what precise collection of simple ideas

modesty or frugality stand for in another's use, is not so certainly known. And however we are apt to think, we well enough know what is meant by gold, or iron; yet the precise complex idea others make them the signs of, is not so certain; and, I believe, it is very seldom, that in speaker and hearer, they stand for exactly the same collection. Which must needs produce mistakes and disputes, when they are made use of in discourses, wherein men have to do with universal propositions, and would settle in their minds universal truths, and consider the consequences that follow from them.

§ 19. *And next to them, simple modes.*—By the same rule, the names of simple modes are, next to those of simple ideas, least liable to doubt and uncertainty, especially those of figure and number, of which men have so clear and distinct ideas. Whoever, that had a mind to understand them, mistook the ordinary meaning of seven, or a triangle; and, in general, the least compounded ideas in every kind, have the least dubious names.

§ 20. *The most doubtful are the names of very compound mixed modes and substances.*—Mixed modes, therefore, that are made up but of a few and obvious simple ideas, have usually names of no very uncertain signification. But the names of mixed modes, which comprehend a great number of simple ideas, are commonly of a very doubtful and undetermined meaning, as has been shewn. The names of substances being annexed to ideas that are neither the real essences nor exact representations of the patterns they are referred to, are liable yet to greater imperfection and uncertainty, especially when we come to a philosophical use of them.

§ 21. *Why this imperfection charged upon words.*—The great disorder that happens in our names of substances, proceeding, for the most part, from our want of knowledge, and inability to penetrate into their real constitutions, it may probably be wondered, why I charge this as an imperfection, rather upon our words than understandings. This exception has so much appearance of justice, that I think myself obliged to give a reason, why I have followed this method. I must confess, then, that when I first began this Discourse of the Understanding, and a good while after, I had not the least thought that any consideration of words was at all necessary to it. But when having passed over the original and composition of our ideas, I began to examine the extent and certainty of our knowledge, I found it had so near a connexion with words, that unless their force and manner of signification were first well observed, there could be very little said clearly and pertinently concerning knowledge; which being conversant about truth, had constantly to do with propositions. And though it terminated in things, yet it was, for the most part, so much by the intervention of words, that they seemed scarce separable from our general knowledge. At least they interpose themselves so much between our understandings and the truth, which it would contemplate and apprehend, that like the medium, through which visible objects pass, their obscurity and disorder does not seldom cast a mist before our eyes, and impose upon our understandings. If we consider, in the fallacies men put upon themselves, as well as others, and the mistakes in men's disputes and notions, how

great a part is owing to words, and their uncertain or mistaken significations, we shall have reason to think this no small obstacle in the way to knowledge, which, I conclude, we are the more carefully to be warned of, because it has been so far from being taken notice of as an inconvenience, that the arts of improving it have been made the business of men's study; and obtained the reputation of learning and subtilty, as we shall see in the following chapter. But I am apt to imagine, that were the imperfections of language, as the instrument of knowledge, more thoroughly weighed, a great many of the controversies that make such a noise in the world, would of themselves cease; and the way to knowledge, and perhaps peace, too, lie a great deal opener than it does.

§ 22. *This should teach us moderation in imposing our own sense of old authors.*—Sure I am, that the signification of words, in all languages, depending very much on the thoughts, notions, and ideas of him that uses them, must unavoidably be of great uncertainty to men of the same language and country. This is so evident in the Greek authors, that he that shall peruse their writings, will find in almost every one of them a distinct language, though the same words. But when to this natural difficulty in every country, there shall be added different countries, and remote ages, wherein the speakers and writers had very different notions, tempers, customs, ornaments, and figures of speech, &c. every one of which influence the signification of their words then, though to us now they are lost and unknown, it would become us to be charitable one to another in our interpretations or misunderstanding of those ancient writings, which, though of great concernment to be understood, are liable to the unavoidable difficulties of speech, which (if we except the names of simple ideas, and some very obvious things) is not capable, without a constant defining the terms of conveying the sense and intention of the speaker, without any manner of doubt and uncertainty to the hearer. And, in discourses of religion, law, and morality, as they are matters of the highest concernment, so there will be the greatest difficulty.

§ 23. The volumes of interpreters and commentators on the Old and New Testaments, are but too manifest proofs of this. Though every thing said in the text be infallibly true, yet the reader may be, nay, cannot choose but be, very fallible in the understanding of it. Nor is it to be wondered, that the will of God, when clothed in words, should be liable to that doubt and uncertainty, which unavoidably attends that sort of conveyance; when even his Son, whilst clothed in flesh, was subject to all the frailties and inconveniences of human nature, sin excepted. And we ought to magnify his goodness, that he hath spread before all the world, such legible characters of his works and providence, and given all mankind so sufficient a light of reason, that they, to whom this written word never came, could not (whenever they set themselves to search) either doubt of the being of a God, or of the obedience due to him. Since, then, the precepts of natural religion are plain, and very intelligible to all mankind, and seldom come to be controverted; and other revealed truths, which are conveyed to us by books and languages, are liable to the common and natural obscurities

and difficulties incident to words, methinks it would become us to be more careful and diligent in observing the former, and less magisterial, positive, and imperious, in imposing our own ideas and interpretations of the latter.

CHAP. X.

OF THE ABUSE OF WORDS.

§ 1. *Abuse of words.*—Besides the imperfection that is naturally in language, and the obscurity and confusion that is so hard to be avoided in the use of words, there are several wilful faults and neglects, which men are guilty of, in this way of communication, whereby they render these signs less clear and distinct in their signification, than, naturally, they need to be.

§ 2. *First, words without any, or without clear, ideas.*—*First*, In this kind, the first and most palpable abuse is, the using of words without clear and distinct ideas; or, which is worse, signs without any thing signified. Of these there are two sorts:

1. One may observe, in all languages, certain words, that, if they be examined, will be found, in their first original, and their appropriated use, not to stand for any clear and distinct ideas. These, for the most part, the several sects of philosophy and religion have introduced. For their authors, or promoters, either affecting something singular, and out of the way of common apprehensions, or to support some strange opinions, or cover some weakness of their hypothesis, seldom fail to coin new words, and such as, when they come to be examined, may justly be called insignificant terms. For having either had no determinate collection of ideas annexed to them, when they were first invented; or at least such as, if well examined, will be found inconsistent, it is no wonder if, afterwards, in the vulgar use of the same party, they remain empty sounds, with little or no signification, amongst those who think it enough to have them often in their mouths, as the distinguishing characters of their church, or school, without much troubling their heads to examine what are the precise ideas they stand for. I shall not need here to heap up instances; every man's reading and conversation will sufficiently furnish him; or if he wants to be better stored, the great mint-masters of this kind of terms, I mean the schoolmen and metaphysicians (under which, I think, the disputing natural and moral philosophers of these latter ages may be comprehended), have wherewithal abundantly to content him.

§ 3. 2. Others there be, who extend this abuse yet farther, who take so little care to lay by words, which in their primary notation have scarce any clear and distinct idea which they are annexed to, that by an unpardonable negligence, they familiarly use words, which the propriety of language has affixed to very important ideas, without any distinct meaning at all. Wisdom, glory, grace, &c. are words frequent enough in every man's mouth; but if a great many of those who use them, should be asked what they mean by them, they would be at a stand, and not know what to answer; a plain proof, that though they

have learned those sounds, and have them ready at their tongue's end yet there are no determined ideas laid up in their minds, which are to be expressed to others by them.

§ 4. *Occasioned by learning names before the ideas they belong to.*—Men having been accustomed from their cradles to learn words, which are easily got and retained, before they knew, or had framed, the complex ideas to which they were annexed, or which were to be found in the things they were thought to stand for, they usually continue to do so all their lives; and without taking the pains necessary to settle in their minds determined ideas, they use their words for such unsteady and confused notions as they have, contenting themselves with the same words other people use, as if their very sound necessarily carried with it constantly the same meaning. This, though men make a shift with in the ordinary occurrences of life, where they find it necessary to be understood, and, therefore, they make signs till they are so: yet this insignificancy in their words, when they come to reason concerning either their tenets or interest, manifestly fills their discourse with abundance of empty unintelligible noise and jargon, especially in moral matters, where the words, for the most part, standing for arbitrary and numerous collections of ideas, not regularly and permanently united in nature, their bare sounds are often only thought on, or at least very obscure and uncertain notions annexed to them. Men take the words they find in use among their neighbours; and that they may not seem ignorant what they stand for, use them confidently without much troubling their heads about a certain fixed meaning: whereby, besides the ease of it, they obtain this advantage, that as in such discourses they seldom are in the right, so they are as seldom to be convinced that they are in the wrong; it being all one to go about to draw those men out of their mistakes, who have no settled notions, as to dispossess a vagrant of his habitation who has no settled abode. This I guess to be so; and every one may observe in himself and others, whether it be or no.

§ 5. *Secondly, unsteady application of them.*—*Secondly*, Another great abuse of words, is inconstancy in the use of them. It is hard to find a discourse written upon any subject, especially of controversy, wherein one shall not observe, if he read with attention, the same words (and those commonly the most material in the discourse, and upon which the argument turns) used sometimes for one collection of simple ideas, and sometimes for another, which is a perfect abuse of language. Words being intended for signs of my ideas, to make them known to others, not by any natural signification, but by a voluntary imposition, it is plain cheat and abuse, when I make them stand sometimes for one thing, and sometimes for another; the wilful doing whereof, can be imputed to nothing but great folly, or greater dishonesty. And a man, in his accounts with another, may, with as much fairness, make the characters of numbers stand sometimes for one, and sometimes for another, collection of units (v. g. this character 3 stands sometimes for three, sometimes for four, and sometimes for eight) as in his discourse, or reasoning, make the same words stand for different collections of simple ideas. If men should do so in their reckonings, I wonder who

would have to do with them? One who would speak thus, in the affairs and business of the world, and call 8 sometimes seven, and sometimes nine, as best served his advantage, would presently have clapped upon him one of the two names men are commonly disgusted with. And yet in arguings, and learned contests, the same sort of proceeding passes commonly for wit and learning; but to me it appears a greater dishonesty, than the misplacing of counters in the casting up a debt; and the cheat the greater, by how much truth is of greater concernment and value than money.

§ 6. *Thirdly, affected obscurity by wrong application.*—*Thirdly,* Another abuse of language, is an affected obscurity, by either applying old words to new and unusual significations, or introducing new and ambiguous terms, without defining either; or else putting them so together, as may confound their ordinary meaning. Though the peripatetic philosophy has been most eminent in this way, yet other sects have not been wholly clear of it. There are scarce any of them that are not cumbered with some difficulties (such is the imperfection of human knowledge), which they have been fain to cover with obscurity of terms, and to confound the signification of words, which, like a mist before people's eyes, might hinder their weak parts from being discovered. That body and extension, in common use, stand for two distinct ideas, is plain to any one that will but reflect a little. For were their signification precisely the same, it would be proper, and as intelligible, to say, the body of an extension, as the extension of a body; and yet there are those who find it necessary to confound their signification. To this abuse, and the mischiefs of confounding the signification of words, logic, and the liberal sciences, as they have been handled in the schools, have given reputation; and the admired art of disputing, hath added much to the natural imperfection of languages, whilst it has been made use of and fitted to perplex the signification of words, more than to discover the knowledge and truth of things; and he that will look into that sort of learned writings, will find the words there much more obscure, uncertain, and undetermined in their meaning, than they are in ordinary conversation.

§ 7. *Logic and dispute have much contributed to this.*—This is unavoidably to be so, where men's parts and learning are estimated by their skill in disputing. And if reputation and reward shall attend these conquests, which depend mostly on the fineness and niceties of words, it is no wonder if the wit of man so employed, should perplex, involve, and subtilize the signification of sounds, so as never to want something to say, in opposing or defending any question; the victory being adjudged not to him who had truth on his side, but the last word in the dispute.

§ 8. *Calling it subtilty.*—This, though a very useless skill, and that which I think the direct opposite to the ways of knowledge, hath yet passed hitherto under the laudable and esteemed names of subtilty and acuteness; and has had the applause of the schools, and encouragement of one part of the learned men of the world. And no wonder, since the philosophers of old (the disputing and wrangling philosophers I mean, such as Lucian wittily and with reason taxes), and the school-

men since, aiming at glory and esteem for their great and universal knowledge, easier a great deal to be pretended to, than really acquired, found this a good expedient to cover their ignorance with a curious and inexplicable web of perplexed words, and procure to themselves the admiration of others by unintelligible terms, the apter to produce wonder, because they could not be understood: whilst it appears in all history, that these profound doctors were no wiser, nor more useful, than their neighbours; and brought but small advantage to human life, or the societies wherein they lived: unless the coining of new words, where they produced no new things to apply them to, or the perplexing or obscuring the signification of old ones, and so bringing all things into question and dispute, were a thing profitable to the life of man, or worthy commendation and reward.

§ 9. *This learning very little benefits society.*—For notwithstanding these learned disputants, these all-knowing doctors, it was to the inscholastic statesman, that the governments of the world owed their peace, defence, and liberties; and from the illiterate and contemned mechanic (a name of disgrace), that they received the improvements of useful arts. Nevertheless, this artificial ignorance, and learned gibberish, prevailed mightily in these last ages, by the interest and artifice of those, who found no easier way to that pitch of authority and dominion they have attained, than by amusing the men of business, and ignorant, with hard words, or employing the ingenious and idle in intricate disputes about unintelligible terms, and holding them perpetually entangled in that endless labyrinth. Besides, there is no such way to gain admittance, or give defence to strange and absurd doctrines, as to guard them round about with legions of obscure, doubtful, and undefined words: which yet make these retreats more like the dens of robbers, or holes of foxes, than the fortresses of fair warriors; which if it be hard to get them out of, it is not for the strength that is in them, but the briars and thorns, and the obscurity of the thickets they are beset with. For untruth being unacceptable to the mind of man, there is no other defence left for absurdity, but obscurity.

§ 10. *But destroys the instruments of knowledge and communication.*—Thus learned ignorance, and this art of keeping, even inquisitive men, from true knowledge, hath been propagated in the world, and hath much perplexed, whilst it pretended to inform, the understanding. For we see, that other well meaning and wise men, whose education and parts had not acquired that acuteness, could intelligibly express themselves to one another; and in its plain use, make a benefit of language. But though unlearned men well enough understood the words white and black, &c. and had constant notions of the ideas signified by those words, yet there were philosophers found, who had learning and subtilty enough to prove, that snow was black, i. e. to prove that white was black. Whereby they had the advantage to destroy the instruments and means of discourse, conversation, instruction, and society; whilst with great art and subtilty, they did no more but perplex and confound the signification of words, and thereby render language less useful, than the real defects of it had made it a gift, which the illiterate had not attained to.

§ 11. *As useful as to compound the sound of the letters.*—These learned men did equally instruct men's understandings, and profit their lives, as he who should alter the signification of known characters, and, by a subtle device of learning, far surpassing the capacity of the illiterate, dull, and vulgar, should in his writing shew, that he could put A for B, and D for E, &c. to the no small admiration and benefit of his reader. It being as senseless to put black, which is a word agreed on to stand for one sensible idea, to put it, I say, for another, or the contrary idea, i. e. to call snow black, as to put this mark A, which is a character agreed on to stand for one modification of sound, made by a certain motion of the organs of speech, for B, which is agreed or to stand for another modification of sound, made by a another certain motion of the organs of speech.

§ 12. *This art has perplexed religion and justice.*—Nor hath this mischief stopped in logical niceties, or curious empty speculations; it hath invaded the great concernments of human life and society; obscured and perplexed the material truths of law and divinity; brought confusion, disorder, and uncertainty into the affairs of mankind; and if not destroyed, yet in a great measure rendered useless, those two great rules, religion and justice. What have the greatest part of the comments and disputes upon the laws of God and man served for, but to make the meaning more doubtful, and perplex the sense? What have been the effect of those multiplied curious distinctions and acute niceties, but obscurity and uncertainty, leaving the words more unintelligible, and the reader more at a loss? How else comes to pass, that princes, speaking or writing to their servants, in their ordinary commands, are easily understood; speaking to their people, in their laws, are not so? And, as I remarked before, doth it not often happen, that a man of an ordinary capacity, very well understands a text, or a law, that he reads, till he consults an expositor, or goes to council; who, by that time he had done explaining them, makes the words signify either nothing at all, or what he pleases?

§ 13. *And ought not to pass for learning.*—Whether any by-interests of these professions have occasioned this, I will not here examine; but I leave it to be considered, whether it would not be well for mankind, whose concernment it is to know things as they are, and to do what they ought, and not to spend their lives in talking about them, or tossing words to and fro; whether it would not be well, I say, that the use of words were made plain and direct; and that language, which was given us for the improvement of knowledge, and bond of society, should not be employed to darken truth, and unsettle people's rights; to raise mists, and render unintelligible both morality and religion? Or that at least, if this will happen, it should not be thought learning or knowledge to do so?

§ 14. *Fourthly, taking them for things.*—*Fourthly*, Another great abuse of words, is the taking them for things. This, though it in some degree concerns all names in general, yet more particularly affects those of substances. To this abuse, those men are most subject, who most confine their thoughts to any one system, and give themselves up into a firm belief of the perfection of any received hypothesis; whereby they

come to be persuaded, that the terms of that sect are so suited to the nature of things, that they perfectly correspond with their real existence. Who is there, that has been bred up in the peripatetic philosophy, who does not think the ten names under which are ranked the ten predicaments, to be exactly conformable to the nature of things? Who is there of that school, that is not persuaded, that substantial forms, vegetative souls, abhorrence of a vacuum, intentional species, &c. are something real? These words men have learned from their very entrance upon knowledge, and have found their masters and systems lay great stress upon them; and therefore they cannot quit the opinion, that they are conformable to nature, and are the representations of something that really exists. The Platonists have their soul of the world, and the Epicureans their endeavour towards motions in their atoms, when at rest. There is scarce any sect in philosophy has not a distinct set of terms that others understand not. But yet this gibberish, which in the weakness of human understanding, serves so well to palliate men's ignorance, and cover their errors, comes by familiar use amongst those of the same tribe, to seem the most important part of language, and of all other, the terms the most significant: and should aërial and ætherial vehicles come once, by the prevalency of that doctrine, to be generally received anywhere, no doubt those terms would made impressions on men's minds, so as to establish them in the persuasion of the reality of such things, as much as peripatetic forms and intentional species have heretofore done.

§ 15. *Instance, in matter.*—How much names taken for things are apt to mislead the understanding, the attentive reading of philosophical writers would abundantly discover; and that perhaps in words little suspected of any such misuse. I shall instance in one only, and that a familiar one. How many intricate disputes have there been about matter, as if it were some such thing really in nature, distinct from body; as it is evident, the word matter stands for an idea distinct from the idea of body? For if the ideas these two terms stood for, were precisely the same, they might indifferently, in all places, be put one for another. But we see, that though it be proper to say, there is one matter of all bodies, one cannot say, there is one body of all matters: we familiarly say, one body is bigger than another; but it sounds harsh (and I think is never used) to say, one matter is bigger than another. Whence comes this, then? viz. from hence, that though matter and body be not really distinct, but wherever there is the one, there is the other; yet matter and body stand for two different conceptions, whereof the one is incomplete, and but a part of the other. For body stands for a solid extended figured substance, whereof matter is but a partial and more confused conception; it seeming to me to be used for the substance and solidity of body, without taking in its extension and figure: and therefore it is that speaking of matter, we speak of it always as one, because, in truth, it expressly contains nothing but the idea of a solid substance, which is every where the same, every where uniform. This being our idea of matter, we no more conceive, or speak of, different matters in the world, than we do of different solidities; though we both conceive and speak of different bodies, because extension and

figure are capable of variation. But since solidity cannot exist without extension and figure, the taking matter to be the name of something really existing under that precision, has no doubt produced those obscure and unintelligible discourses and disputes, which have filled the heads and books of philosophers concerning *materia prima*; which imperfection or abuse, how far it may concern a great many other general terms, I leave to be considered. This I think I may at least say, that we should have a great many fewer disputes in the world, if words were taken for what they are, the signs of our ideas only, and not for things themselves. For when we argue about matter, or any the like term, we truly argue only about the idea we express by that sound, whether that precise idea agree to any thing really existing in nature, or no. And if men would tell what ideas they make their words stand for, there could not be half that obscurity or wrangling in the search or support of truth that there is.

§ 16. *This makes errors lasting.*—But whatever inconvenience follows from this mistake of words, this I am sure, that by constant and familiar use, they charm men into notions far remote from the truth of things. It would be a hard matter to persuade any one that the words which his father or school-master, the parson of the parish, or such a reverend doctor, used, signified nothing that really existed in nature: which, perhaps, is none of the least causes, that men are so hardly drawn to quit their mistakes, even in opinions purely philosophical, and where they have no other interest but truth. For the words they have a long time been used to, remaining firm in their minds, it is no wonder that the wrong notions annexed to them should not be removed.

§ 17. *Fifthly, setting them for what they cannot signify.*—*Fifthly*, Another abuse of words is the setting them in the place of things, which they do or can by no means signify. We may observe, that in the general names of substances, whereof the nominal essences are only known to us, when we put them into propositions, and affirm or deny any thing about them, we do most commonly tacitly suppose or intend they should stand for, the real essence of a certain sort of substances. For when a man says gold is malleable, he means and would insinuate something more than this, that what I call gold is malleable (though truly it amounts to no more), but would have this understood, viz. that gold, i. e. what has the real essence of gold, is malleable; which amounts to thus much, that malleableness depends on, and is inseparable from, the real essence of gold. But a man not knowing wherein that real essence consists, the connexion in his mind of malleableness is not truly with an essence he knows not, but only with the sound gold he puts for it. Thus when we say, that *animal rationale* is, and *animal implume bipes latis unguibus*, is not, a good definition of a man; it is plain, we suppose the name man in this case to stand for the real essence of a species, and would signify, that a rational animal better described that real essence, than a two-legged animal with broad nails, and without feathers. For else why might not Plato as properly make the word *ἄνθρωπος* or man, stand for his complex idea, made up of the ideas of a body, distinguished from others by a certain shape, and other outward appearances, as Aristotle made the complex idea, to which he

gave the name *ἄνθρωπος* or man, of body, and the faculty of reasoning, joined together; unless the name *ἄνθρωπος* or man, were supposed to stand for something else than what it signifies; and to be put in the place of some other thing than the idea a man professes he would express by it.

§ 18. *V. g. Putting them for the real essences of substances.*—It is true, the names of substances would be much more useful, and propositions made in them much more certain, were the real essences of substances the ideas in our minds, which those words signified. And it is for want of those real essences, that our words convey so little knowledge or certainty in our discourses about them: and therefore the mind, to remove that imperfection as much as it can, makes them by a secret supposition, to stand for a thing having that real essence, as if thereby it made some nearer approaches to it. For though the words man or gold, signifying nothing truly but a complex idea of properties, united together in one sort of substances; yet there is scarce any body in the use of these words, but often supposes each of those names to stand for a thing having the real essence on which these properties depend. Which is so far from diminishing the imperfections of our words, that by a plain abuse it adds to it, when we would make them stand for something, which not being in our complex idea, the name we use can no ways be the sign of.

§ 19. *Hence we think every change of our idea in substances, not to change the species.*—This shews us the reason why in mixed modes, any of the ideas that make the composition of the complex one, being left out or changed, it is allowed to be another thing, i. e. to be of another species, as is plain in chance-medley, manslaughter, murder, parricide, &c. The reason whereof is, because the complex idea signified by that name, is the real as well as nominal essence; and there is no secret reference of that name to any other essence but that. But in substances, it is not so. For though in that called gold, one puts into his complex idea what another leaves out, and *vice versâ*; yet men do not usually think that therefore the species is changed: because they secretly in their minds refer that name, and suppose it annexed to a real immutable essence of a thing existing, on which those properties depend. He that adds to his complex idea of gold, that of fixedness and solubility in *aqua regia*, which he put not in it before, is not thought to have changed the species; but only to have a more perfect idea, by adding another simple idea, which is always in fact joined with those other, of which his former complex idea consisted. But this reference of the name to a thing, whereof we have not the idea, is so far from helping at all, that it only serves the more to involve us in difficulties. For by this tacit reference to the real essence of that species of bodies, the word gold (which by standing for a more or less perfect collection of simple ideas, serves to design that sort of body well enough in civil discourse) comes to have no signification at all, being put for somewhat, whereof we have no idea at all, and so can signify nothing at all, when the body itself is away. For however it may be thought all one; yet if well considered, it will be found quite a different thing, to argue about gold in name, and about a parcel in the body itself, v. g. a piece of leaf-gold

laid before us; though in discourse we are fain to substitute the name for the thing.

§ 20. *The cause of the abuse, a supposition of nature's working always regularly.*—That which I think very much disposes men to substitute their names for the real essences of species, is the supposition before mentioned, that nature works regularly in the production of things, and sets the boundaries to each of those species, by giving exactly the same real internal constitution to each individual, which we rank under one general name. Whereas, any one who observes their different qualities, can hardly doubt, that many of the individuals, called by the same name, are, in their internal constitution, as different one from another, as several of those which are ranked under different specific names. This supposition, however, that the same precise internal constitution goes always with the same specific name, makes men forward to take those names for the representatives of those real essences, though indeed they signify nothing but the complex ideas they have in their minds when they use them. So that, if I may so say, signifying one thing, and being supposed for, or put in the place of, another, they cannot but, in such a kind of use, cause a great deal of uncertainty in men's discourses; especially in those who have thoroughly imbibed the doctrine of substantial forms, whereby they firmly imagine the several species of things to be determined and distinguished.

§ 21. *This abuse contains two false suppositions.*—But however preposterous and absurd it be, to make our names stand for ideas we have not, or (which is all one) essences that we know not, it being in effect to make our words the signs of nothing; yet it is evident to any one, who reflects ever so little on the use men make of their words, that there is nothing more familiar. When a man asks whether this or that thing he sees, let it be a drill, or a monstrous fœtus, be a man, or no; it is evident, the question is not, whether that particular thing agree to his complex idea, expressed by the name man: but whether it has in it the real essence of a species of things, which he supposes his name man to stand for. In which way of using the names of substances, there are these false suppositions contained:

First, That there are certain precise essences, according to which nature makes all particular things, and by which they are distinguished into species. That every thing has a real constitution, whereby it is what it is, and on which its sensible qualities depend, is past doubt: but I think it has been proved, that this makes not the distinction of species, as we rank them; nor the boundaries of their names.

Secondly, This tacitly also insinuates, as if we had ideas of these proposed essences. For to what purpose else is it, to inquire whether this or that thing have the real essence of the species man, if we did not suppose that there were such a specific essence known? Which yet is utterly false: and therefore such application of names, as would make them stand for ideas which we have not, must needs cause great disorder in discourses and reasonings about them, and be a great inconvenience in our communication by words.

§ 22. *Sixthly, a supposition that words have a certain and evident signification.*—*Sixthly,* There remains yet another more general, though

perhaps less observed, abuse of words; and that is, that men having by a long and familiar use annexed to them certain ideas, they are apt to imagine so near and necessary a connexion between the names and the signification they use them in, that they forwardly suppose one cannot but understand what their meaning is; and therefore one ought to acquiesce in the words delivered, as if it were past doubt, that in the use of those common received sounds, the speaker and hearer had necessarily the same precise ideas. Whence presuming, that when they have in discourse used any term, they have thereby, as it were, set before others the very thing they talk of. And so likewise taking the words of others, as naturally standing for just what they themselves have been accustomed to apply them to, they never trouble themselves to explain their own, or understand clearly others', meaning. From whence commonly proceed noise and wrangling, without improvement or information; whilst men take words to be the constant regular marks of agreed notions, which in truth are no more but the voluntary and unsteady signs of their own ideas. And yet men think it strange, if in discourse, or (where it is often absolutely necessary) in dispute, one sometimes asks the meaning of their terms: though the arguings one may every day observe in conversation, make it evident, that there are few names of complex ideas, which any two men use for the same just precise collection. It is hard to name a word which will not be a clear instance of this. Life is a term, none more familiar. Any one almost would take it for an affront, to be asked what he meant by it. And yet if it comes in question, whether a plant, that lies ready formed in the seed, have life; whether the embryo of an egg before incubation, or a man in a swoon without sense or motion, be alive, or no? it is easy to perceive, that a clear distinct settled idea does not always accompany the use of so known a word, as that of life is. Some gross and confused conceptions men indeed ordinarily have, to which they apply the common words of their language, and such a loose use of their words serves them well enough in their ordinary discourses or affairs. But this is not sufficient for philosophical inquiries. Knowledge and reasoning require precise determinate ideas. And though men will not be so importunately dull, as not to understand what others say, without demanding an explication of their terms; nor so troublesomely critical, as to correct others in the use of the words they receive from them; yet where truth and knowledge are concerned in the case, I know not what fault it can be to desire the explication of words, whose sense seems dubious; or why a man should be ashamed to own his ignorance, in what sense another man uses his words, since he has no other way of certainly knowing it, but by being informed. This abuse of taking words upon trust, has no where spread so far, nor with so ill effects, as amongst men of letters. The multiplication and obstinacy of disputes, which have so laid waste the intellectual world, is owing to nothing more than to this ill use of words. For though it be generally believed, that there is great diversity of opinions in the volumes and variety of controversies the world is distracted with, yet the most I can find that the contending learned men of different parties do, in their arguings one with another, is, that they speak different languages.

For I am apt to imagine, that when any of them quitting terms, think upon things, and know what they think, they think all the same: though perhaps what they would have, be different.

§ 23. *The ends of language: first, to convey our ideas.*—To conclude this consideration of the imperfection and abuse of language; the ends of language in our discourse with others being chiefly these three: *First*, To make known one man's thoughts or ideas to one another. *Secondly*, To do it with as much ease and quickness as possible; and *Thirdly*, Thereby to convey the knowledge of things: language is either abused, or deficient, when it fails of any of these three.

First, Words fail in the first of these ends, and lay not open one man's ideas to another's view. 1. When men have names in their mouths without any determined ideas in their minds, whereof they are the signs: or, 2. When they apply the common received names of any language to ideas, to which the common use of that language does not apply them: or, 3. When they apply them very unsteadily, making them stand now for one, and by-and-by for another idea.

§ 24. *Secondly, to do it with quickness.*—*Secondly*, Men fail of conveying their thoughts, with all the quickness and ease that may be, when they have complex ideas, without having any distinct names for them. This is sometimes the fault of the language itself, which has not in it a sound yet applied to such a signification; and sometimes the fault of the man, who has not yet learned the name for that idea he would shew another.

§ 25. *Thirdly, therewith to convey the knowledge of things.*—*Thirdly*, There is no knowledge of things conveyed by men's words, when their ideas agree not to the reality of things. Though it be a defect, that has its original in our ideas, which are not so conformable to the nature of things, as attention, study, and application, might make them: yet it fails not to extend itself to our words too, when we use them as signs of real beings, which yet never had any reality or existence.

§ 26. *How men's words fail in all these.*—*First*, He that hath words of any language, without distinct ideas in his mind, to which he applies them, does, so far as he uses them in discourse, only make a noise without any sense or signification, and how learned soever he may seem by the use of hard words, or learned terms, is not much more advanced thereby in knowledge, than he would be in learning, who had nothing in his study but the bare titles of books, without possessing the contents of them. For all such words, however put into discourse, according to the right construction of grammatical rules, or the harmony of well turned periods, do yet amount to nothing but bare sounds, and nothing else.

§ 27. *Secondly*, He that has complex ideas, without particular names for them, would be in no better a case than a bookseller, who had in his warehouse volumes that lay there unbound, and without titles; which he could, therefore, make known to others, only by shewing the loose sheets and communicating them only by tale. This man is hindered in his discourse, for want of words to communicate his complex ideas, which he is therefore forced to make known by an enumeration of the simple ones that compose them: and so is fain often to use twenty words to express what another man signifies in one.

§ 28. *Thirdly*, He that puts not constantly the same sign for the same idea, but uses the same words, sometimes in one, and sometimes in another, signification, ought to pass in the schools and conversation, for as fair a man as he does in the market and exchange, who sells several things under the same name.

§ 29. *Fourthly*, He that applies the words of any language to ideas different from those to which the common use of that country applies them, however his own understanding may be filled with truth and light, will not by such words be able to convey much of it to others, without defining his terms. For however the sounds are such as are familiarly known, and easily enter the ears of those who are accustomed to them; yet standing for other ideas than those they usually are annexed to, and are wont to excite in the mind of the hearers, they cannot make known the thoughts of him who thus uses them.

§ 30. *Fifthly*, He that imagined to himself substances such as never have been, and filled his head with ideas which have not any correspondence with the real nature of things, to which yet he gives settled and defined names, may fill his discourse, and perhaps another man's head, with the fantastical imaginations of his own brain, but will be very far from advancing thereby one jot in real and true knowledge.

§ 31. He that hath names without ideas, wants meaning in his words, and speaks only empty sounds. He that hath complex ideas without names for them, wants liberty and dispatch in his expressions, and is necessitated to use periphrases. He that uses his words loosely and unsteadily, will either be not minded, or not understood. He that applies his ideas to names different from their common use, wants propriety in his language, and speaks gibberish. And he that hath the ideas of substances, disagreeing with the real existence of things, so far wants the materials of true knowledge in his understanding, and hath instead thereof, chimeras.

§ 32. *How in substances.*—In our notions concerning substances, we are liable to all the former inconveniences; v. g. 1. He that uses the word *tarantula*, without having any imagination or idea of what it stands for, pronounces a good word; but so long means nothing at all by it. 2. He that in a new-discovered country shall see several sorts of animals and vegetables unknown to him before, may have as true ideas of them, as of a horse, or a stag; but can speak of them only by a description, till he shall either take the names the natives call them by, or give them names himself. 3. He that uses the word *body* sometimes for pure extension and sometimes for extension and solidity together, will talk very fallaciously. 4. He that gives the name *horse* to that idea which common usage calls *mule*, talks improperly, and will not be understood. 5. He that thinks the name *centaur* stands for some real being, imposes on himself, and mistakes words for things.

§ 33. *How in modes and relations.*—In modes and relations, generally, we are liable only to the four first of these inconveniences, viz. 1. I may have in my memory the names of modes, as *gratitude*, or *charity*, and yet not have any precise ideas annexed in my thoughts to those names. 2. I may have ideas, and not know the names that belong to them; v. g. I may have the idea of a man's drinking till his colour and

humour be altered, till his tongue trips, and his eyes look red, and his feet fail him, and yet not know that it is to be called drunkenness. 3. I may have the ideas of virtues or vices, and names also, but apply them amiss; v. g. when I apply the name frugality to that idea which others call and signify by this sound, covetousness. 4. I may use any of those names with inconstancy. 5. But in modes and relations, I cannot have ideas disagreeing to the existence of things; for modes being complex ideas made by the mind at pleasure; and relation being but by way of considering or comparing two things together, and so also an idea of my own making, these ideas can scarce be found to disagree with any thing existing; since they are not in the mind, as the copies of things, regularly made by nature, nor as properties inseparably flowing from the internal constitution or essence of any substance; but, as it were, patterns lodged in my memory with names annexed to them, to denominate actions and relations by, as they come to exist. But the mistake is commonly in my giving a wrong name to my conceptions: and so using words in a different sense from other people, I am not understood, but am thought to have wrong ideas of them, when I give wrong names to them. Only if I put in my ideas of mixed modes or relations, any inconsistent ideas together, I fill my head also with chimeras; since such ideas, if well examined, cannot so much as exist in the mind, much less any real being be ever denominated from them.

§ 34. *Seventhly, figurative language also an abuse of language.*— Since wit and fancy finds easier entertainment in the world, than dry truth and real knowledge, figurative speeches, and allusion in language, will hardly be admitted as an imperfection or abuse of it. I confess, in discourses, where we seek rather pleasure and delight, than information and improvement, such ornaments as are borrowed from them, can scarce pass for faults. But yet if we would speak of things as they are we must allow, that all the art of rhetoric, besides order and clearness, all the artificial and figurative application of words eloquence hath invented, are for nothing else but to insinuate wrong ideas, move the passions, and thereby mislead the judgment, and so, indeed, are perfect cheats; and, therefore, however laudable or allowable oratory may render them in harangues and popular addresses, they are certainly in all discourses that pretend to inform or instruct, wholly to be avoided; and where truth and knowledge are concerned, cannot but be thought a great fault, either of the language or person that makes use of them. What, and how various, they are, will be superfluous here to take notice; the books of rhetoric which abound in the world, will instruct those who want to be informed. Only I cannot but observe, how little the preservation and improvement of truth and knowledge, is the care and concern of mankind: since the arts of fallacy are endowed and preferred. It is evident how much men love to deceive, and be deceived, since rhetoric, that powerful instrument of error and deceit, has its established professors, is publicly taught, and has always been had in great reputation; and I doubt not but it will be thought a great boldness, if not brutality, in me, to have said thus much against it. Eloquence, like the fair sex, has too prevailing beauties in it, to suffer itself ever to be spoken against. And it is in vain to find fault with those arts of deceiving, wherein men find pleasure to be deceived.

CHAP. XI.

OF THE REMEDIES OF THE FOREGOING IMPERFECTIONS
AND ABUSES.

§ 1. *They are worth seeking.*—The natural and improved imperfections of languages, we have seen above at large; and speech being the great bond that holds society together, and the common conduit, whereby the improvements of knowledge are conveyed from one man, and one generation, to another, it would well deserve our most serious thoughts, to consider what remedies are to be found for these inconveniences above-mentioned.

§ 2. *Are not easy.*—I am not so vain to think, that any one can pretend to attempt the perfect reforming the languages of the world, no, not so much as of his own country, without rendering himself ridiculous. To require that men should use their words constantly in the same sense, and for none but determined and uniform ideas, would be to think, that all men should have the same notions, and should talk of nothing but what they have clear and distinct ideas of. Which is not to be expected by any one, who hath not vanity enough to imagine he can prevail with men to be very knowing or very silent. And he must be very little skilled in the world, who thinks that a voluble tongue shall accompany only a good understanding; or that men's talking much or little, shall hold proportion only to their knowledge.

§ 3. *But yet necessary to philosophy.*—But though the market and exchange must be left to their own ways of talking, and gossippings not to be robbed of their ancient privilege; though the schools, and men of argument, would, perhaps, take it amiss to have any thing offered, to abate the length, or lessen the number, of their disputes; yet, methinks, those who pretend seriously to search after or maintain truth, should think themselves obliged to study how they might deliver themselves without obscurity, doubtfulness, or equivocation, to which men's words are naturally liable, if care be not taken.

§ 4. *Misuse of words, the great cause of errors.*—For he that shall well consider the errors and obscurity, the mistakes and confusion, that are spread in the world by an ill use of words, will find some reason to doubt, whether language, as it has been employed, has contributed more to the improvement or hindrance of knowledge amongst mankind. How many are there, that when they would think on things, fix their thoughts only on words, especially when they would apply their minds to moral matters; and who then can wonder, if the result of such contemplations and reasonings, about little more than sounds, whilst the ideas they annexed to them are very confused, or very unsteady, or, perhaps, none at all; who can wonder, I say, that such thoughts and reasonings end in nothing but obscurity and mistake, without any clear judgment or knowledge?

§ 5. *Obstinacy.*—This inconvenience, in all ill use of words, men suffer in their own private meditations; but much more manifest are the disorders which follow from it, in conversation, discourse, and

arguings with others. For language being the great conduit whereby men convey their discoveries, reasonings, and knowledge, from one to another, he that makes an ill use of it, though he does not corrupt the fountains of knowledge, which are in things themselves, yet he does, as much as in him lies, break or stop the pipes whereby it is distributed to the public use and advantage of mankind. He that uses words without any clear and steady meaning, what does he but lead himself and others into errors! And he that designedly does it, ought to be looked on as an enemy to truth and knowledge. And yet who can wonder, that all the sciences and parts of knowledge, have been so overcharged with obscure and equivocal terms, and insignificant and doubtful expressions, capable to make the most attentive or quick-sighted very little, or not at all, the more knowing or orthodox; since subtilty in those who make profession to teach or defend truth, hath passed so much for a virtue. A virtue, indeed, which consisting, for the most part, in nothing but the fallacious and illusory use of obscure and deceitful terms, is only fit to make men more conceited in their ignorance, and obstinate in their errors.

§ 6. *And wrangling.*—Let us look into the books of controversy of any kind, there we shall see, that the effect of obscure, unsteady, or equivocal terms, is nothing but noise and wrangling about sounds, without convincing or bettering a man's understanding. For if the idea be not agreed on, betwixt the speaker and hearer, for which the words stand, the argument is not about things, but names. As often as such a word, whose signification is not ascertained betwixt them, comes in use, their understandings have no other object wherein they agree, but barely the sound, the things that they think on at that time, as expressed by that word, being quite different.

§ 7. *Instance, bat and bird.*—Whether a bat be a bird, or no, is not a question; whether a bat be another thing than indeed it is, or have other qualities than indeed it has, for that would be extremely absurd to doubt of; but the question is, 1. Either between those that acknowledged themselves to have but imperfect ideas of one or both of those sorts of things, for which these names are supposed to stand; and then it is real inquiry concerning the nature of a bird, or a bat, to make their yet imperfect ideas of it more complete, by examining, whether all the simple ideas, to which, combined together, they both give the name bird, be all to be found in a bat; but this is a question only of inquirers (not disputers), who neither affirm, nor deny, but examine; or, 2. It is a question between disputants, whereof the one affirms, and the other denies, that a bat is a bird. And then the question is barely about the signification of one, or both these words; in that they not having both the same complex ideas, to which they give these two names; one holds, and the other denies, that these two names may be affirmed one of another. Were they agreed in the signification of these two names, it were impossible they should dispute about them. For they would presently, and clearly, see (were that adjusted between them), whether all the simple ideas of the more general name bird, were found in the complex ideas of a bat, or no; and so there could be no doubt, whether a bat were a bird, or no. And here I desire it may be considered, and

carefully examined, whether the greatest part of the disputes in the world, are not merely verbal, and about the signification of words; and whether, if the terms they are made in, were defined and reduced in their signification (as they must be, where they signify any thing) to determine collections of the simple ideas they do, or should, stand for, those disputes would not end of themselves, and immediately vanish. I leave it then to be considered, what the learning of disputation is, and how well they are employed for the advantage of themselves, or others, whose business is only the vain ostentation of sounds, i. e. those who spend their lives in disputes and controversies. When I shall see any of those combatants strip all his terms of ambiguity and obscurity (which every one may do in the words he uses himself), I shall think him a champion for knowledge, truth, and peace, and not the slave of vanity, ambition, or a party.

§ 8. *First, remedy to use no word without an idea.*—To remedy the defects of speech before-mentioned, to some degree, and to prevent the inconveniencies that follow from them, I imagine the observation of these following rules may be of use, till somebody better able shall judge it worth his while, to think more maturely on this matter, and oblige the world with his thoughts on it.

First, A man should take care to use no word without a signification, no name without an idea for which he makes it stand. This rule will not seem altogether needless, to any one who shall take the pains to recollect how often he has met with such words as instinct, sympathy, antipathy, &c. in the discourse of others, so made use of, as he might easily conclude, that those that used them, had no ideas in their mind to which they applied them; but spoke them only as sounds, which usually served instead of reasons, on the like occasions. Not but that these words, and the like, have very proper significations in which they may be used; but there being no natural connexion between any words, and any ideas, these, and any other, may be learned by rote, and pronounced or writ by men who have no ideas in their minds, to which they have annexed them, and for which they make them stand; which is necessary they should, if men would speak intelligibly even to themselves alone.

§ 9. *Secondly, to have distinct ideas annexed to them in modes.*—*Secondly*, It is not enough a man uses his words as signs of some ideas; those he annexed them to, if they be simple, must be clear and distinct; if complex, must be determinate, i. e. the precise collection of simple ideas settled in the mind, with that sound annexed to it, as the sign of that precise determined collection, and no other. This is very necessary in names of modes, and especially moral words, which having no settled objects in nature, from whence their ideas are taken, as from their original, are apt to be very confused. Justice is a word in every man's mouth, but most commonly with a very undetermined loose signification: which will always be so, unless a man has in his mind a distinct comprehension of the component parts that complex idea consists of; and if it be decomposed, must be able to resolve it still on, till he at last comes to the simple ideas that make it up; and unless this be done, a man makes an ill use of the word; let it be justice, for ex-

ample, or any other. I do not say, a man need stand to recollect, and make this analysis at large, every time the word justice comes in his way; but this, at least, is necessary, that he have so examined the signification of that name, and settled the idea of all its parts in his mind, that he can do it when he pleases. If one who makes this complex idea of justice to be such a treatment of the person or goods of another, as is according to law, hath not a clear and distinct idea what law is, which makes a part of his complex idea of justice, it is plain, his idea of justice itself will be confused and imperfect. This exactness will, perhaps, be judged very troublesome; and therefore most men will think they may be excused from settling the complex ideas of mixed modes so precisely in their minds. But yet I must say, till this be done, it must not be wondered, that they have a great deal of obscurity and confusion in their own minds, and a great deal of wrangling in their discourses with others.

§ 10. *Distinct and conformable in substances.*—In the names of substances, for a right use of them, something more is required than barely determined ideas; in these, the names must also be conformable to things, as they exist; but of this, I shall have occasion to speak more at large by-and-by. This exactness is absolutely necessary in inquiries after philosophical knowledge, and in controversies about truth. And though it would be well, too, if it extended itself to common conversation, and the ordinary affairs of life; yet I think that is scarce to be expected. Vulgar notions suit vulgar discourses: and both, though confused enough, yet serve pretty well the market, and the wake. Merchants and lovers, cooks and tailors, have words wherewithal to dispatch their ordinary affairs; and so, I think, might philosophers and disputants too, if they had a mind to understand, and to be clearly understood.

§ 11. *Thirdly, propriety.*—*Thirdly*, It is not enough that men have ideas, determined ideas, for which they make these signs stand; but they must also take care to apply their words as near as may be, to such ideas as common use has annexed them to. For words, especially of languages already framed, being no man's private possession, but the common measure of commerce and communication, it is not for any one, at pleasure, to change the stamp they are current in; nor alter the ideas they are fixed to; or at least, when there is a necessity so to do, he is bound to give notice of it. Men's intentions in speaking are, or at least should be, understood; which cannot be without frequent explanations, demands, and other the like incommodious interruptions, where men do not follow common use. Propriety of speech, is that which gives our thoughts entrance into other men's minds with the greatest ease and advantage; and therefore deserves some part of our care and study, especially in the names of moral words. The proper signification and use of terms, is best to be learned from those, who in their writings and discourses, appear to have had the clearest notions, and applied to them their terms with the exactest choice and fitness. This way of using a man's words, according to the propriety of language, though it have not always the good fortune to be understood; yet most commonly leaves the blame of it on him, who is so unskilful

in the language he speaks, as not to understand it, when made use of as it ought to be.

§ 12. *Fourthly, to make known their meaning.*—*Fourthly*, But because common use has not so visibly annexed any signification to words as to make men know always certainly what they precisely stand for; and because men, in the improvement of their knowledge, come to have ideas different from the vulgar and ordinary received ones, for which they must either make new words (which men seldom venture to do, for fear of being thought guilty of affectation, or novelty), or else must use old ones, in a new signification. Therefore, after the observation of the foregoing rules, it is sometimes necessary for the ascertaining the signification of words, to declare their meaning; where either common use has left it uncertain and loose (as it has in most names of very complex ideas) or where the term being very material in the discourse, and that upon which it chiefly turns, is liable to any doubtfulness or mistake.

§ 13. *And that three ways.*—As the ideas men's words stand for, are of different sorts; so the way of making known the ideas they stand for, when there is occasion, is also different. For though defining be thought the proper way to make known the proper signification of words; yet there are some words that will not be defined, as there are others, whose precise meaning cannot be made known, but by definition; and perhaps a third, which partakes somewhat of both the other, as we shall see in the names of simple ideas, modes, and substances.

§ 14. *First, in simple ideas by synonymous terms, or shewing.*—*First*, When a man makes use of the name of any simple idea, which he perceives is not understood, or is in danger to be mistaken, he is obliged, by the laws of ingenuity, and the end of speech, to declare his meaning, and make known what idea he makes it stand for. This, as has been shewn, cannot be done by definition; and, therefore, when a synonymous word fails to do it, there is but one of these ways left. *First*, Sometimes the naming the subject, wherein that simple idea is to be found, will make its name to be understood by those who are acquainted with that subject, and know it by that name. So to make a countryman understand what *feuille morte* colour signifies, it may suffice to tell him, it is the colour of withered leaves falling in autumn. *Secondly*, But the only sure way of making known the signification of the name of any simple idea, is by presenting to his senses that subject, which may produce it in his mind, and make him actually have the idea that word stands for.

§ 15. *Secondly, in mixed modes, by definition.*—*Secondly*, In mixed modes, especially those belonging to morality, being most of them such combinations of ideas as the mind puts together of its own choice; and whereof there are not always standing patterns to be found existing; the signification of their names cannot be made known, as those of simple ideas, by any shewing; but in recompense thereof, may be perfectly and exactly defined. For they being combinations of several ideas that the mind of man has arbitrarily put together, without reference to any archetypes, men may, if they please, exactly know the ideas that go to each composition, and so both use these words in a certain and

undoubted signification, and perfectly declare, when there is occasion, what they stand for. This, if well considered, would lay great blame on those, who make not their discourses about moral things very clear and distinct. For since the precise signification of the names of mixed modes, or, which is all one, the real essence of each species, is to be known, they being not of nature's, but man's making, it is a great negligence and perverseness to discourse of moral things with uncertainty and obscurity, which is more pardonable in treating of natural substances, where doubtful terms are hardly to be avoided, for a quite contrary reason, as we shall see by-and-by.

§ 16. *Morality capable of demonstration.*—Upon this ground it is that I am bold to think, that morality is capable of demonstration, as well as mathematics; since the precise real essence of the things moral words stand for, may be perfectly known; and so the congruity, or incongruity, of the things themselves be certainly discovered, in which consists perfect knowledge. Nor let any object, that the names of substances are often to be made use of in morality, as well as those of modes, from which will arise obscurity. For as to substances, when concerned in moral discourses, their divers natures are not so much inquired into, as supposed; v. g. when we say, that man is subject to law; we mean nothing by man, but a corporeal rational creature: what the real essence or other qualities of that creature are in this case, is no way considered. And therefore, whether a child or changeling be a man in a physical sense, may amongst the naturalists be as disputable as it will, it concerns not at all the moral man, as I may call him, which is this immoveable unchangeable idea, a corporeal rational being. For were there a monkey, or any other creature, to be found, that has the use of reason, to such a degree, as to be able to understand general signs, and to deduce consequences about general ideas, he would no doubt be subject to law, and in that sense, be a man, how much soever he differed in shape from others of that name. The names of substances, if they be used in them, as they should, can no more disturb moral, than they do mathematical, discourses; where, if the mathematician speaks of a cube or globe of gold, or any other body, he has his clear settled idea, which varies not, though it may, by mistake, be applied to a particular body, to which it belongs not.

§ 17. *Definitions can make moral discourses clear.*—This I have here mentioned by-the-by, to shew of what consequence it is for men, in their names of mixed modes, and consequently in all their moral discourses, to define their words when there is occasion: since thereby moral knowledge may be brought to so great clearness and certainty. And it must be great want of ingenuity (to say no worse of it), to refuse to do it: since a definition is the only way whereby the precise meaning of moral words can be known: and yet a way whereby their meaning may be known certainly, and without leaving any room for any contest about it. And therefore the negligence or perverseness of mankind cannot be excused, if their discourses in morality be not much more clear than those in natural philosophy; since they are about ideas in the mind, which are none of them false or disproportionate? they having no external beings for the archetypes which they

are referred to, and must correspond with. It is far easier for men to frame in their minds an idea, which shall be the standard to which they will give the name justice, with which pattern so made, all actions that agree shall pass under that denomination; than, having seen Aristides, to frame an idea that shall in all things be exactly like him, who is as he is, let men make what idea they please of him. For the one, they need but know the combination of ideas that are put together in their own minds; for the other, they must inquire into the whole nature, and abstruse hidden constitution, and various qualities, of a thing existing without them.

§ 18. *And is the only way.*—Another reason that makes the defining of mixed modes so necessary, especially of moral words, is what I mentioned a little before, viz. that it is the only way whereby the signification of the most of them can be known with certainty. For the ideas they stand for, being for the most part such, whose component parts no where exist together, but scattered and mingled with others, it is the mind alone that collects them, and gives them the union of one idea: and it is only by words enumerating the several simple ideas which the mind has united, that we can make known to others what their names stand for; the assistance of the senses in this case not helping us, by the proposal of sensible objects, to shew the ideas which our names of this kind stand for, as it does often in the names of sensible simple ideas, and also to some degree in those of substances.

§ 19. *Thirdly, in substances, by shewing and defining.*—*Thirdly,* For the explaining the signification of the names of substances, as they stand for the ideas we have of their distinct species, both the before-mentioned ways, viz. of shewing and defining, are requisite, in many cases, to be made use of. For there being ordinarily in each sort some leading qualities, to which we suppose the other ideas, which make up our complex idea of that species, annexed; we forwardly give the specific name to that thing, wherein that characteristic mark is found, which we take to be the most distinguishing idea of that species. These leading or characteristic (as I may so call them) ideas, in the sorts of animals and vegetables, are (as has been before remarked, ch. vi. § 29. and ch. ix. § 15.) mostly figure, and in inanimate bodies, colour, and in some, both together. Now,

§ 20. *Ideas of the leading qualities of substances, are best got by shewing.*—These leading sensible qualities are those which make the chief ingredients of our specific ideas, and consequently the most observable and invariable part in the definitions of our specific names, as attributed to sorts of substances coming under our knowledge. For though the sound man, in its own nature, be as apt to signify a complex idea made up of animality and rationality, united in the same subject, as to signify any other combination; yet used as a mark to stand for a sort of creatures we count of our own kind, perhaps the outward shape is as necessary to be taken into our complex idea, signified by the word man, as any other we find in it; and therefore why Plato's *animal implume bipes latis unguibus*, should not be as good a definition of the name man, standing for that sort of creatures, will not be easy to shew: for it is the shape, as the leading quality, that seems more

to determine that species, than a faculty of reason, which appears not at first, and in some never. And if this be not allowed to be so, I do not know how they can be excused from murder, who kill monstrous births (as we call them), because of an unordinary shape, without knowing whether they have a rational soul, or no; which can be no more discerned in a well-formed, than ill-shaped, infant, as soon as born. And who is it has informed us, that a rational soul can inhabit no tement, unless it has just such a sort of frontispiece; or can join itself to, and inform no sort of body but one that is just of such an outward structure?

§ 21. Now these leading qualities are best made known by shewing, and can hardly be made known otherwise. For the shape of a horse, or cassuary, will be but rudely and imperfectly imprinted on the mind by words; the sight of the animals doth it a thousand times better: and the idea of the particular colour of gold is not to be got by any description of it, but only by the frequent exercise of the eyes about it, as is evident in those who are used to this metal, who will frequently distinguish true from counterfeit, pure from adulterate, by the sight; where others (who have as good eyes, but yet, by use, have not got the precise nice idea of that peculiar yellow) shall not perceive any difference. The like may be said of those other simple ideas peculiar in their kind to any substance; for which precise ideas, there are no peculiar names. The particular ringing sound there is in gold, distinct from the sound of other bodies, has no particular name annexed to it, no more than the particular yellow that belongs to that metal.

§ 22. *The ideas of their powers, best by definition.*—But because many of the simple ideas that make up our specific ideas of substances, are powers which lie not obvious to our senses in the things as they ordinarily appear; therefore, in the signification of our names of substances, some part of the signification will be better made known by enumerating those simple ideas, than by shewing the substances itself. For he that, to the yellow shining colour of gold got by sight, shall, from my enumerating them, have the ideas of great ductility, fusibility, fixedness, and solubility in *aqua regia*, will have a more perfect idea of gold, than he can have by seeing a piece of gold, and thereby imprinting in his mind only its obvious qualities. But if the formal constitution of this shining, heavy, ductile thing (from whence all these its properties flow), lay open to our senses, as the formal constitution or essence of a triangle does, the signification of the word gold might as easily be ascertained as that of triangle.

§ 23. *A reflection on the knowledge of spirits.*—Hence we may take notice, how much the foundation of all our knowledge of corporeal things lies in our senses. For how spirits, separate from bodies (whose knowledge and ideas of these things, are certainly much more perfect than ours), know them, we have no notion, no idea at all. The whole extent of our knowledge, or imagination, reaches not beyond our own ideas, limited to our ways of perception. Though yet it be not to be doubted, that spirits of a higher rank than those immersed in flesh, may have as clear ideas of the radical constitution of substances, as we have of a triangle, and so perceive how all their properties and operations flow

from thence: but the manner how they come by that knowledge, exceeds our conceptions.

§ 24. *Ideas also of substances must be conformable to things.*—But though definitions will serve to explain the names of substances, as they stand for our ideas; yet they leave them not without great imperfection, as they stand for things. For our names of substances being not put barely for our ideas, but being made use of ultimately to represent things, and so are put in their place, their signification must agree with the truth of things, as well as with men's ideas. And therefore in substances, we are not always to rest in the ordinary complex idea, commonly received as the signification of that word, but must go a little farther, and inquire into the nature and properties of the things themselves, and thereby perfect, as much as we can, our ideas of their distinct species; or else learn them from such as are used to that sort of things, and are experienced in them. For since it is intended their names should stand for such collections of simple ideas as do really exist in things themselves, as well as for the complex idea in other men's minds, which in their ordinary acceptation they stand for: therefore to define their names right, natural history is to be inquired into; and their properties are with care and examination to be found out. For it is not enough, for the avoiding inconveniences in discourse and arguings about natural bodies and substantial things, to have learned from the propriety of the language, the common, but confused, or very imperfect, idea to which each word is applied, and to keep them to that idea in our use of them: but we must, by acquainting ourselves with the history of that sort of things, rectify and settle our complex idea, belonging to each specific name; and in discourse with others (if we find them mistake us), we ought to tell what the complex idea is that we make such a name stand for. This is the more necessary to be done by all those who search after knowledge and philosophical verity, in that children being taught words whilst they have but imperfect notions of things, apply them at random, and without much thinking, and seldom frame determined ideas to be signified by them. Which custom (it being easy, and serving well enough for the ordinary affairs of life and conversation), they are apt to continue, when they are men: and so begin at the wrong end, learning words first, and perfectly, but make the notions to which they apply those words afterward, very overtly. By this means it comes to pass, that men speaking the proper language of their country, i. e. according to grammar-rules of that language, do yet speak very improperly of things themselves; and by their arguing one with another, make but small progress in the discoveries of useful truths, and the knowledge of things, as they are to be found in themselves, and not in our imaginations; and it matters not much, for the improvement of our knowledge, how they are called.

§ 25. *Not easy to be made so.*—It were, therefore, to be wished, that men, versed in physical inquiries, and acquainted with the several sorts of natural bodies, would set down those simple ideas, wherein they observe the individuals of each sort constantly to agree. This would remedy a great deal of that confusion which comes from several persons applying the same name to a collection of a smaller or greater

number of sensible qualities, proportionably as they have been more or less acquainted with, or accurate in examining the qualities of, any sort of things, which come under one denomination. But a dictionary of this sort, containing, as it were, a natural history, requires too many hands, as well as too much time, cost, pains, and sagacity, ever to be hoped for; and till that be done, we must content ourselves with such definitions of the names of substances, as explain the sense men use them in. And it would be well, where there is occasion, if they would afford us so much. This yet, is not usually done; but men talk to one another, and dispute in words, whose meaning is not agreed between them, out of a mistake, that the signification of common words are certainly established, and the precise ideas they stand for, perfectly known; and that it is a shame to be ignorant of them. Both which suppositions are false: no names of complex ideas having so settled determined significations, that they are constantly used for the same precise ideas. Nor is it a shame for a man not to have a certain knowledge of any thing, but by the necessary ways of attaining it; and so it is no discredit not to know what precise idea any sound stands for in another man's mind, without he declare it to me by some other way than barely using that sound, there being no other way, without such a declaration, certainly to know it. Indeed, the necessity of communication, by language, brings men to an agreement in the signification of common words, within some tolerable latitude, that may serve for ordinary conversation; and so a man cannot be supposed wholly ignorant of the ideas which are annexed to words by common use, in a language familiar to him. But common use being but a very uncertain rule, which reduces itself at last to the ideas of particular men, proves often but a very variable standard. But though such a dictionary, as I have above mentioned, will require too much time, cost, and pains, to be hoped for in this age; yet, methinks, it is not unreasonable to propose, that words standing for things which are known and distinguished by their outward shapes, should be expressed by little draughts and prints made of them. A vocabulary made after this fashion would perhaps, with more ease, and in less time, teach the true signification of many terms, especially in languages of remote countries or ages, and settle truer ideas in men's minds of several things whereof we read the names in ancient authors, than all the large and laborious comments of learned critics. Naturalists, that treat of plants and animals, have found the benefit of this way; and he that has had occasion to consult them, will have reason to confess, that he has a clearer idea of apium or ibex, from a little print of that herb, or beast, than he could have from a long definition of the names of either of them. And so, no doubt, he would have of strigil and sistrum, if instead of a curry-comb and cymbal, which are the English names dictionaries render them by, he could see stamped in the margin, small pictures of these instruments, as they were in use amongst the ancients. Toga, tunica, pallium, are words easily translated by gown, coat, and cloak; but we have thereby no more true ideas of the fashion of those habits amongst the Romans, than we have of the faces of the tailors who made them. Such things as these which the eye distinguishes by their shapes, would be best let into the mind by drafts

made of them, and more determine the signification of such words, than any other words set for them, or made use of to define them. But this only by-the-by.

§ 26. *Fifthly, by constancy in their signification.*—*Fifthly*, If men will not be at the pains to declare the meaning of their words, and definitions of their terms are not to be had; yet this is the least that can be expected, that in all discourses, wherein one man pretends to instruct or convince another, he should use the same word constantly in the same sense; if this were done (which nobody can refuse without great disingenuity), many of the books extant might be spared; many of the controversies in dispute would be at an end, several of those great volumes, swollen with ambiguous words, now used in one sense, and by-and-by in another, would shrink into a very narrow compass; and many of the philosophers' (to mention no other) as well as poets' works, might be contained in a nut-shell.

§ 27. *When the variation is to be explained.*—But after all the provision of words is so scanty in respect of that infinite variety of thoughts that men, wanting terms to suit their precise notions, will, notwithstanding their utmost caution, be forced often to use the same word, in somewhat different senses. And though in the continuation of a discourse, or the pursuit of an argument, there can be hardly room to digress into a particular definition, as often as a man varies the signification of any term; yet the import of the discourse will, for the most part, if there be no designed fallacy, sufficiently lead candid and intelligent readers into the true meaning of it; but where that is not sufficient to guide the reader, there it concerns the writer to explain his meaning, and shew in what sense he there uses that term.

BOOK IV.—CHAP. I.

OF KNOWLEDGE IN GENERAL.

§ 1. *Our knowledge conversant about our ideas.*—SINCE the mind, in all its thoughts and reasonings, hath no other immediate object but its own ideas, which it alone does or can contemplate, it is evident that our knowledge is only conversant about them.

§ 2. *Knowledge is the perception of the agreement or disagreement of two ideas.*—Knowledge then seems to me to be nothing but the perception of the connexion and agreement, or disagreement and repugnancy, of any of our ideas. In this alone it consists. Where this perception is, there is knowledge; and where it is not, there, though we may fancy, guess, or believe, yet we always come short of knowledge. For when we know that white is not black, what do we else but perceive, that these two ideas do not agree? When we possess ourselves with the utmost security of the demonstration that the three angles of a triangle are equal to two right ones; what do we more but perceive, that equality to two right ones, does necessarily agree to, and is inseparable from, the three angles of a triangle?*

* The placing of certainty, as Mr. Locke does, in the perception of the agreement or disagreement of our ideas, the Bishop of Worcester suspects may be of dangerous conse-

§ 3. *This agreement fourfold.*—But to understand a little more distinctly, wherein this agreement or disagreement consists, I think

quence to that article of faith which he has endeavoured to defend: to which Mr. Locke answers:^a “ Since your lordship hath not, as I remember, shewn, or gone about to shew, how this proposition, viz. that certainty consists in the perception of the agreement or disagreement of two ideas, is opposite or inconsistent with that article of faith which your lordship has endeavoured to defend; it is plain, it is but your lordship’s fear, that it may be of dangerous consequence to it, which, as I humbly conceive, is no proof that it is any way inconsistent with that article.

“ Nobody, I think, can blame your lordship, or any one else, for being concerned for any article of the Christian faith; but if that concern (as it may, and as we know it has done) makes any one apprehend danger, where no danger is, are we, therefore, to give up and condemn any proposition, because any one, though of the first rank and magnitude, fears it may be of dangerous consequence to any truth of religion, without shewing that it is so? If such fears be the measures whereby to judge of truth and falsehood, the affirming that there are antipodes, would be still a heresy; and the doctrine of the motion of the earth must be rejected, as overthrowing the truth of the scripture, for of that dangerous consequence it has been apprehended to be, by many learned and pious divines, out of their great concern for religion. And yet, notwithstanding those great apprehensions of what dangerous consequence it might be, it is now universally received by learned men, as an undoubted truth; and writ for by some, whose belief of the scripture is not at all questioned; and particularly, very lately, by a divine of the Church of England, with great strength of reason, in his wonderfully ingenious *New Theory of the Earth*.

“ The reason your lordship gives of your fears, that it may be of such dangerous consequence to that article of faith, which your lordship endeavours to defend, though it occur in more places than one, is only this, viz. That it is made use of by ill men to do mischief, i. e. to oppose that article of faith, which your lordship hath endeavoured to defend. But, my lord, if it be a reason to lay by any thing as bad, because it is, or may be, used to an ill purpose, I know not what will be innocent enough to be kept. Arms, which were made for our defence, are sometimes made use of to do mischief; and yet they are not thought of dangerous consequence for all that. Nobody lays by his sword and pistols, or thinks them of such dangerous consequence as to be neglected, or thrown away, because robbers, and the worst of men, sometimes make use of them to take away honest men’s lives or goods. And the reason is, because they were designed, and will serve, to preserve them. And who knows but this may be the present case? If your lordship thinks, that placing of certainty in the perception of the agreement or disagreement of ideas, be to be rejected as false, because you apprehend it may be of dangerous consequence to that article of faith: on the other side, perhaps others, with me, may think it a defence against error, and so (as being of good use) to be received and adhered to.

“ I would not, my lord, be hereby thought to set up my own, or any one’s, judgment against your lordship’s. But I have said this only to shew, whilst the argument lies for or against the truth of any proposition, barely in an imagination that it may be of consequence to the supporting or overthrowing of any remote truth; it will be impossible, that way, to determine of the truth or falsehood of that proposition. For imagination will be set up against imagination, and the stronger probably will be against your lordship; the strongest imaginations being usually in the weakest heads. The only way, in this case, to put it past doubt, is to shew the inconsistency of the two propositions; and then it will be seen, that one overthrows the other; the true, the false one.

“ Your lordship says, indeed, this is a new method of certainty. I will not say so myself, for fear of deserving a second reproof from your lordship, for being too forward to assume to myself the honour of being an original. But this, I think, gives me occasion, and will excuse me from being thought impertinent, if I ask your lordship whether there be any other, or older, method of certainty? and what it is? For if there be no other, nor older than this, either this was always the method of certainty, and so mine is no new one; or else the world is obliged to me for this new one, after having been so long in the want of so necessary a thing as a method of certainty. If there be an older, I am sure your lordship cannot but know it; your condemning mine as new, as well as your thorough insight into antiquity, cannot but satisfy every body that you do. And therefore to set the world right in a thing of that great concernment, and to overthrow mine, and thereby prevent the dangerous consequence there is in my having unreasonably started it, will not, I humbly conceive, misbecome your lordship’s care of that article you have endeavoured to defend, nor the good-will you bear to truth in general. For I will be answerable for myself, that I shall; and I think I may be for all others, that they all will give off the placing of certainty

^a In his second letter to the Bishop of Worcester.

we may reduce it all to these four sorts: 1. Identity or diversity. 2. Relation. 3. Co-existence or necessary connexion. 4. Real existence.

in the perception of the agreement or disagreement of ideas, if your lordship will be pleased to shew that it lies in any thing else.

“But truly, not to ascribe to myself an invention of what has been as old as knowledge is in the world, I must own I am not guilty of what your lordship is pleased to call starting new methods of certainty. Knowledge, ever since there has been any in the world, has consisted in one particular action in the mind; and so, I conceive, will continue to do to the end of it. And to start new methods of knowledge, or certainty (for they are to me the same thing), i. e. to find out and propose new methods of attaining knowledge, either with more ease and quickness, or in things yet unknown, is what I think nobody could blame; but this is not that which your lordship here means, by new methods of certainty. Your lordship, I think, means by it, the placing of certainty in something, wherein either it does not consist, or else wherein it was not placed before now; if this be to be called a new method of certainty. As to the latter of these, I shall know whether I am guilty or no, when your lordship will do me the favour to tell me wherein it was placed before; which your lordship knows I professed myself ignorant of, when I writ my book, and so I am still. But if starting new methods of certainty, be the placing of certainty in something wherein it does not consist; whether I have done that or no, I must appeal to the experience of mankind.

“There are several actions of men’s minds, that they are conscious to themselves of performing, as willing, believing, knowing, &c. which they have so particular a sense of, that they can distinguish them one from another; or else they could not say, when they willed, when they believed, and when they knew any thing. But though these actions were different enough from one another, not to be confounded by those who spoke of them, yet nobody, that I have met with, had, in their writings, particularly set down wherein the act of knowing precisely consisted.

“To this reflection upon the actions of my own mind, the subject of my essay concerning Human Understanding naturally led me; wherein if I have done any thing new, it has been to describe to others, more particularly than had been done before, what it is their minds do when they perform that action which they call knowing; and if, upon examination, they observe I have given a true account of that action of their minds in all the parts of it, I suppose it will be in vain to dispute against what they find and feel in themselves. And if I have not told them right and exactly what they find and feel in themselves, when their minds perform the act of knowing, what I have said will be all in vain; men will not be persuaded against their senses. Knowledge is an internal perception of their minds; and if, when they reflect on it, they find that it is not what I have said it is, my groundless conceit will not be hearkened to, but be exploded by every body, and die of itself; and nobody need to be at any pains to drive it out of the world. So impossible is it to find out, or start new methods of certainty, or to have them received if any one places it in any thing, but in that wherein it really consists; much less can any one be in danger to be misled into error, by any such new, and to every one visibly, senseless project. Can it be supposed, that any one could start a new method of seeing, and persuade men thereby, that they do not see what they do see? Is it to be feared that any one can cast such a mist over their eyes, that they should not know when they see, and so be led out of their way by it?

“Knowledge, I find in myself, and I conceive in others, consists in the perception of the agreement or disagreement of the immediate objects of the mind in thinking, which I call ideas; but whether it does so in others or no, must be determined by their own experience, reflecting upon the action of their mind in knowing; for that I cannot alter, nor, I think, they themselves. But whether they will call those immediate objects of their minds in thinking, ideas or no, is perfectly in their own choice. If they dislike that name, they may call them notions or conceptions, or how they please; it matters not, if they use them so as to avoid obscurity and confusion. If they are constantly used in the same and a known sense, every one has the liberty to please himself in his terms; there lies neither truth, nor error, nor science, in that: though those that take them for things, and not for what they are, bare arbitrary signs of our ideas, make a great deal ado often about them; as if some greater matter lay in the use of this or that sound. All that I know, or can imagine, of difference about them, is that those words are always best, whose significations are best known in the sense they are used; and so are least apt to breed confusion.

“My lord, your lordship hath been pleased to find fault with my use of the new term, ideas, without telling me a better name for the immediate objects of the mind in thinking. Your lordship also has been pleased to find fault with my definition of knowledge, without doing me the favour to give me a better. For it is only about my definition of knowledge, that all this stir concerning certainty is made. For, with me, to know, and to be certain, is the same thing; what I know, that I am certain of; and what I am certain of, that I know.

§ 4. *First, of identity, or diversity.*—*First*, As to the first sort of agreement or disagreement, viz. identity or diversity, it is the first act of the mind, when it has any sentiments or ideas at all, to perceive its ideas, and so far as it perceives them, to know each what it is, and thereby also to perceive their difference, and that one is not another. This is so absolutely necessary, that without it, there could be no know-

What reaches to knowledge, I think may be called certainty; and what comes short of certainty, I think cannot be called knowledge; as your lordship could not but observe in the 18th section of chap. iv. of my 4th book, which you have quoted.

“My definition of knowledge stands thus: ‘Knowledge seems to me to be nothing but the perception of the connexion and agreement, or disagreement and repugnancy, of any of our ideas.’ This definition your lordship dislikes, and apprehends it may be of dangerous consequence as to that article of Christian faith which your lordship hath endeavoured to defend. For this there is a very easy remedy; it is but for your lordship to set aside this definition of knowledge by giving us a better, and this danger is over. But your lordship chooses rather to have a controversy with my book for having it in it, and to put me upon the defence of it; for which I must acknowledge myself obliged to your lordship for affording me so much of your time, and for allowing me the honour of conversing so much with one so far above me in all respects.

“Your lordship says, it may be of dangerous consequence to that article of Christian faith which you have endeavoured to defend. Though the laws of disputing allow bare denial as a sufficient answer to sayings, without any offer of a proof; yet, my lord, to shew how willing I am to give your lordship all satisfaction, in what you apprehend may be of dangerous consequence in my book, as to that article, I shall not stand still sullenly, and put your lordship upon the difficulty of shewing wherein that danger lies; but shall, on the other side, endeavour to shew your lordship that that definition of mine, whether true or false, right or wrong, can be of no dangerous consequence to that article of faith. The reason which I shall offer for it is this, because it can be of no consequence to it at all.

“That which your lordship is afraid it may be dangerous to, is an article of faith: that which your lordship labours and is concerned for, is the certainty of faith. Now, my lord, I humbly conceive the certainty of faith, if your lordship thinks fit to call it so, has nothing to do with the certainty of knowledge. As to talk of the certainty of faith, seems all one to me, as to talk of the knowledge of believing, a way of speaking not easy to me to understand.

“Place knowledge in what you will; start what new methods of certainty you please, that are apt to leave men’s minds more doubtful than before; place certainty on such grounds as will leave little or no knowledge in the world (for these are the arguments your lordship uses against my definition of knowledge): this shakes not at all, nor in the least concerns, the assurance of faith; that is quite distinct from it, neither stands nor falls with knowledge.

“Faith stands by itself, and upon grounds of its own; nor can be removed from them, and placed on those of knowledge. Their grounds are so far from being the same, or having any thing common, that when it is brought to certainty, faith is destroyed; it is knowledge then, and faith no longer.

“With what assurance soever of believing I assent to any article of faith, so that I steadfastly venture my all upon it, it is still but believing. Bring it to certainty, and it ceases to be faith. ‘I believe that Jesus Christ was crucified, dead, and buried, rose again the third day from the dead, and ascended into heaven:’ let now such methods of knowledge or certainty be started; as leave men’s minds more doubtful than before; let the grounds of knowledge be resolved into what any one pleases, it touches not my faith; the foundation of that stands as sure as before, and cannot be at all shaken by it; and one may as well say, that any thing that weakens the sight, or casts a mist before the eyes, endangers the hearing; as that any thing which alters the nature of knowledge (if that could be done) should be of dangerous consequence to an article of faith.

“Whether then I am, or am not mistaken, in the placing certainty in the perception of the agreement or disagreement of ideas; whether this account of knowledge be true or false, enlarges or straitens the bounds of it more than it should; faith stands still upon its own basis, which is not at all altered by it; and every article of that has just the same unmoved foundation, and the very same credibility, that it had before. So that, my lord, whatever I have said about certainty, and how much soever I may be out in it, if I am mistaken, your lordship has no reason to apprehend any danger to any article of faith from thence; every one of them stands upon the same bottom it did before, out of the reach of what belongs to knowledge and certainty. And thus much of my way of certainty by ideas; which, I hope, will satisfy your lordship how far it is from being dangerous to any article of the Christian faith whatsoever.”

ledge, no reasoning, no imagination, no distinct thoughts at all. By this, the mind clearly and infallibly perceives each idea to agree with itself, and to be what it is; and all distinct ideas to disagree, i. e. the one not to be the other; and this it does without pains, labour, or deduction; but, at first view, by its natural power of perception and distinction. And though men of art have reduced this into those general rules, "What is, is;" and "It is impossible for the same thing to be, and not to be;" for ready application in all cases, wherein there may be occasion to reflect on it; yet it is certain that the first exercise of this faculty is about particular ideas. A man infallibly knows, as soon as ever he has them in his mind, that the ideas he calls white and round, are the very ideas they are; and that they are not other ideas, which he calls red or square. Nor can any maxim or proposition in the world, make him know it clearer or surer than he did before, and without any such general rule. This, then, is the first agreement, or disagreement which the mind perceives in its ideas; which it always perceives at first sight; and if there ever happens any doubt about it, it will always be found to be about the names, and not the ideas themselves, whose identity and diversity will always be perceived, as soon and as clearly as the ideas themselves are; nor can it possibly be otherwise.

§ 5. *Secondly, relative.*—*Secondly*, The next sort of agreement or disagreement the mind perceives in any of its ideas, may, I think, be called relative, and is nothing but the perception of the relation between any two ideas of what kind soever, whether substances, modes, or any other. For since all distinct ideas must eternally be known not to be the same, and so be universally and constantly denied one of another, there could be no room for any positive knowledge at all, if we could not perceive any relation between our ideas, and find out the agreement or disagreement they have one with another, in several ways the mind takes of comparing them.

§ 6. *Thirdly, of co-existence.*—*Thirdly*, The third sort of agreement or disagreement to be found in our ideas, which the perception of the mind is employed about, is co-existence, or non-co-existence, in the same subject; and this belongs particularly to substances. Thus when we pronounce concerning gold, that it is fixed, our knowledge of this truth amounts to no more but this, that fixedness, or a power to remain in the fire unconsumed, is an idea that always accompanies, and is joined with that particular sort of yellowness, weight, fusibility, malleableness, and solubility in *aqua regia*, which make our complex idea signified by the word gold.

§ 7. *Fourthly, of real existence.*—*Fourthly*, The fourth and last sort is, that of actual and real existence agreeing to any idea. Within these four sorts of agreement or disagreement is, I suppose, contained all the knowledge we have, or are capable of: for all the inquiries that we can make concerning any of our ideas, all that we know or can affirm concerning any of them, is, that it is, or is not, the same with some other; that it does, or does not, always co-exist with some other idea in the same subject; that it has this or that relation to some other idea; or that it has a real existence without the mind. Thus, blue is not yellow, is of identity. Two triangles upon equal bases, between two parallels,

are equal, is of relation: iron is susceptible of magnetical impressions, is, of co-existence: God is, is of real existence. Though identity and co-existence are truly nothing, but relations, yet they are so peculiar ways of agreement, or disagreement, of our ideas, that they deserve well to be considered as distinct heads, and not under relation in general; since they are so different grounds of affirmation and negation, as will easily appear to any one who will but reflect on what is said in several places of this essay. I should not proceed to examine the several degrees of our knowledge, but that it is necessary first to consider the different acceptations of the word knowledge.

§ 8. *Knowledge actual or habitual.*—There are several ways wherein the mind is possessed of truth; each of which is called knowledge.

First, There is actual knowledge, which is the present view the mind has of the agreement or disagreement of any of its ideas, or of the relation they have one to another.

Secondly, A man is said to know any proposition, which having been once laid before his thoughts, he evidently perceived the agreement or disagreement of the ideas whereof it consists; and so lodged it in his memory, that whenever that proposition comes again to be reflected on, he, without doubt or hesitation, embraces the right side, assents to, and is certain of, the truth of it. This, I think, one may call habitual knowledge; and thus a man may be said to know all those truths, which are lodged in his memory by a foregoing clear and full perception, whereof the mind is assured past doubt, as often as it has occasion to reflect on them. For our finite understandings being able to think clearly and distinctly but on one thing at once, if men had no knowledge of any more than what they actually thought on, they would all be very ignorant: and he that knew most, would know but one truth, that being all he was able to think on at one time.

§ 9. *Habitual knowledge two-fold.*—Of habitual knowledge, there are also, vulgarly speaking, two degrees:

First, The one is of such truths laid up in the memory, as whenever they occur to the mind, it actually perceives the relation is between those ideas. And this is in all those truths, whereof we have an intuitive knowledge, where the ideas themselves, by an immediate view, discover their agreement or disagreement one with another.

Secondly, The other is of such truths, whereof the mind having been convinced, it retains the memory of the conviction, without the proofs. Thus a man that remembers certainly, that he once perceived the demonstration, that the three angles of a triangle are equal to two right ones, is certain that he knows it, because he cannot doubt the truth of it. In his adherence to a truth, where the demonstration, by which it was at first known, is forgot, though a man may be thought rather to believe his memory, than really to know, and this way of entertaining a truth seemed formerly to me like something between opinion and knowledge, a sort of assurance which exceeds bare belief, for that relies on the testimony of another; yet upon a due examination, I find it comes not short of perfect certainty, and is in effect true knowledge. That which is apt to mislead our first thoughts into a mistake in this matter, is, that the agreement or disagreement of the ideas in this case is

not perceived, as it was at first, by an actual view of all the intermediate ideas, whereby the agreement or disagreement of those in the proposition was at first perceived; but by other intermediate ideas, that shew the agreement or disagreement of the ideas contained in the proposition whose certainty we remember. For example, in this proposition, that the three angles of a triangle are equal to two right ones, one who has seen and clearly perceived the demonstration of this truth, knows it to be true, when that demonstration is gone out of his mind; so that at present it is not actually in view, and possibly cannot be recollected; but he knows it in a different way from what he did before. The agreement of the two ideas joined in that proposition, is perceived, but it is by the intervention of other ideas than those which at first produced that perception. He remembers, i. e. he knows (for remembrance is but the reviving of some past knowledge), that he was once certain of the truth of this proposition, that the three angles of a triangle are equal to two right ones. The immutability of the same relations between the same immutable things, is now the idea that shews him, that if the three angles of a triangle were once equal to two right ones, they will always be equal to right ones. And hence he comes to be certain, that what was once true in the case, is always true; what ideas once agreed, will always agree; and consequently what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it. Upon this ground it is, that particular demonstrations in mathematics afford general knowledge. If then the perception that the same ideas will eternally have the same habitudes and relations, be not a sufficient ground of knowledge, there could be no knowledge of general propositions in mathematics; for no mathematical demonstration would be any other than particular: and when a man had demonstrated any proposition concerning one triangle or circle, his knowledge would not reach beyond that particular diagram. If he would extend it farther, he must renew his demonstration in another instance, before he could know it to be true in another like triangle, and so on; by which means, one could never come to the knowledge of any general propositions. Nobody, I think, can deny that Mr. Newton certainly knows any proposition, that he now at any time reads in his book, to be true, though he has not in actual view that admirable chain of intermediate ideas, whereby he at first discovered it to be true. Such a memory as that, able to retain such a train of particulars, may be well thought beyond the reach of human faculties. When the very discovery, perception, and laying together that wonderful connexion of ideas, is found to surpass most readers' comprehension. But yet it is evident the author himself knows the proposition to be true, remembering he once saw the connexion of those ideas, as certainly as he knows such a man wounded another, remembering that he saw him run through. But because the memory is not always so clear as actual perception, and does in all men more or less decay in length of time, this, amongst other differences, is one, which shews, that demonstrative knowledge is much more imperfect than intuitive, as we shall see in the following chapter.

CHAP. II.

OF THE DEGREES OF OUR KNOWLEDGE.

§ 1. *Intuitive.*—All our knowledge consisting, as I have said, in the view the mind has of its own ideas, which is the utmost light and greatest certainty, we with our faculties, and in our way of knowledge, are capable of, it may not be amiss to consider a little the degrees of its evidence. The different clearness of our knowledge seems to me to lie in the different way of perception the mind has of the agreement or disagreement of any of its ideas. For if we will reflect on our own ways of thinking, we shall find, that sometimes the mind perceives the agreement or disagreement of two ideas immediately by themselves, without the intervention of any other: and this, I think, we may call intuitive knowledge. For in this, the mind is at no pains in proving or examining, but perceives the truth, as the eye doth light, only by being directed towards it. Thus the mind perceives that white is not black, that a circle is not a triangle, that three are more than two, and equal to one and two. Such kind of truths the mind perceives at the first sight of the ideas together, by bare intuition, without the intervention of any other idea; and this kind of knowledge is the clearest, and most certain, that human frailty is capable of. This part of knowledge is irresistible, and like bright sunshine, forces itself immediately to be perceived, as soon as ever the mind turns its view that way; and leaves no room for hesitation, doubt, or examination, but the mind is presently filled with the clear light of it. It is on this intuition, that depends all the certainty and evidence of all our knowledge, which certainty every one finds to be so great, that he cannot imagine, and therefore not require, a greater; for a man cannot conceive himself capable of a greater certainty, than to know that any idea in his mind is such as he perceives it to be; and that two ideas, wherein he perceives a difference, are different, and not precisely the same. He that demands a greater certainty than this, demands he knows not what, and shews only that he has a mind to be a sceptic, without being able to be so. Certainty depends so wholly on this intuition, than in the next degree of knowledge, which I call demonstrative, this intuition is necessary in all the connexions of the intermediate ideas, without which, we cannot attain knowledge and certainty.

§ 2. *Demonstrative.*—The next degree of knowledge is where the mind perceives the agreement or disagreement of any ideas, but not immediately. Though wherever the mind perceives the agreement or disagreement of any of its ideas, there be certain knowledge; yet it does not always happen, that the mind sees that agreement or disagreement, which there is between them, even where it is discoverable; and in that case, remains in ignorance, and at most, gets no farther than a probable conjecture. The reason why the mind cannot always perceive presently the agreement or disagreement of two ideas, is because those ideas concerning whose agreement or disagreement the inquiry is made, cannot by the mind be so put together, as to shew it. In this case

then, when the mind cannot so bring its ideas together, as by their immediate comparison, and, as it were, juxta-position, or application one to another, to perceive their agreement or disagreement, it is fain, by the intervention of other ideas (one or more, as it happens), to discover the agreement or disagreement which it searches; and this is that which we call reasoning. Thus the mind being willing to know the agreement or disagreement in bigness, between the three angles of a triangle, and two right ones, cannot by an immediate view and comparing them, do it; because the three angles of a triangle cannot be brought at once, and be compared with any one or two angles; and so of this the mind has no immediate, no intuitive, knowledge. In this case, the mind is fain to find out some other angles, to which the three angles of a triangle have an equality; and finding those equal to two right ones, comes to know their equality to two right ones.

§ 3. *Depends on proofs.*—Those intervening ideas, which serve to shew the agreement of any two others, are called proofs; and where the agreement or disagreement is by this means plainly and clearly perceived, it is called demonstration, it being shewn to the understanding, and the mind made to see that it is so. A quickness in the mind to find out these intermediate ideas (that shall discover the agreement or disagreement of any other), and to apply them right, is, I suppose, that which is called sagacity.

§ 4. *But not so easy.*—This knowledge by intervening proofs, though it be certain, yet the evidence of it is not altogether so clear and bright, nor the assent so ready, as an intuitive knowledge. For though in demonstration, the mind does at last perceive the agreement or disagreement of the ideas it considers, yet it is not without pains and attention; there must be more than one transient view to find it. A steady application and pursuit are required to this discovery; and there must be a progression by steps and degrees, before the mind can in this way arrive at certainty, and come to perceive the agreement or repugnancy between two ideas that need proofs, and the use of reason to shew it.

§ 5. *Not without precedent.*—Another difference between intuitive and demonstrative knowledge, is, that though in the latter all doubt be removed, when, by the intervention of the intermediate ideas, the agreement or disagreement is perceived; yet before the demonstration there was a doubt, which, in intuitive knowledge, cannot happen to the mind that has its faculty of perception left to a degree capable of distinct ideas, no more than it can be a doubt to the eye (that can distinctly see white and black), whether this ink and this paper be all of a colour. If there be sight in the eyes, it will at first glimpse, without hesitation, perceive the words printed on this paper, different from the colour of the paper; and so if the mind have the faculty of distinct perceptions, it will perceive the agreement or disagreement of those ideas that produce intuitive knowledge. If the eyes have lost the faculty of seeing, or the mind of perceiving, we in vain inquire after the quickness of sight in one, or clearness of perception in the other.

§ 6. *Not so clear.*—It is true, the perception produced by demonstration, is also very clear; yet it is often with a great abatement of that evident lustre and full assurance, that always accompany that which I

call intuitive, like a face reflected by several mirrors one to another, where, as long as it retains the similitude and agreement with the object, it produces a knowledge; but it is still in every successive reflection with a lessening of that perfect clearness and distinctness, which is in the first; till at last, after many removes, it has a great mixture of dimness, and is not at first sight so knowable, especially to weak eyes. Thus it is with knowledge, made out by a long train of proofs.

§ 7. *Each step must have intuitive evidence.*—Now, in every step reason makes in demonstrative knowledge, there is an intuitive knowledge of that agreement or disagreement, it seeks with the next intermediate idea, which it uses as a proof: for if it were not so, that yet would need a proof; since without the perception of such agreement or disagreement, there is no knowledge produced. If it be perceived by itself, it is intuitive knowledge; if it cannot be perceived by itself, there is need of some intervening idea, as a common measure to shew their agreement or disagreement. By which it is plain, that every step in reasoning, that produces knowledge, has intuitive certainty: which when the mind perceives, there is no more required, but to remember it, to make the agreement or disagreement of the ideas, concerning which we inquire, visible and certain. So that to make any thing a demonstration, it is necessary to perceive the immediate agreement of the intervening ideas, whereby the agreement or disagreement of the two ideas under examination (whereof the one is always the first, and the other the last, in the account) is found. This intuitive perception of the agreement or disagreement of the intermediate ideas, in each step and progression of the demonstration, must also be carried exactly in the mind, and a man must be sure that no part is left out; which, because in long deductions, and the use of many proofs, the memory does not always so readily and exactly retain; therefore it comes to pass, that this is more imperfect than intuitive knowledge, and men embrace often falsehood for demonstrations.

§ 8. *Hence the mistake, ex præcognitis et præconcessis.*—The necessity of this intuitive knowledge, in each step of scientific or demonstrative reasoning, gave occasion, I imagine, to that mistaken axiom, that all reasoning was *ex præcognitis et præconcessis*; which how far it is mistaken, I shall have occasion to shew more at large, when I come to consider propositions, and particularly those propositions which are called maxims; and to shew that it is by a mistake, that they are supposed to be the foundations of all our knowledge and reasonings.

§ 9. *Demonstration not limited to quantity.*—It has been generally taken for granted, that mathematics alone are capable of demonstrative certainty; but to have such an agreement or disagreement, as may intuitively be perceived, being, as I imagine, not the privilege of the ideas of number, extension, and figure alone, it may possibly be the want of due method and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of knowledge, and been scarce so much as aimed at by any but mathematicians. For whatever ideas we have, wherein

the mind can perceive the immediate agreement or disagreement that is between them, there the mind is capable of intuitive knowledge; and where it can perceive the agreement or disagreement of any two ideas, by an intuitive perception of the agreement or disagreement they have with any intermediate ideas, there the mind is capable of demonstration, which is not limited to ideas of extension, figure, number, and their modes.

§ 10. *Why it has been so thought.*—The reason why it has been generally sought for, and supposed to be only in those, I imagine has been not only the general usefulness of those sciences; but because, in comparing their equality or excess, the modes of numbers have every the least difference very clear and perceivable; and though in extension, every the least excess is not so perceptible; yet the mind has found out ways to examine and discover demonstratively the just equality of two angles, or extensions, or figures; and both these, i. e. numbers and figures, can be set down by visible and lasting marks, wherein the ideas under consideration are perfectly determined, which, for the most part, they are not, where they are marked only by names and words.

§ 11. But in other simple ideas, whose modes and differences are made and counted by degrees, and not quantity, we have not so nice and accurate a distinction of their differences, as to perceive and find ways to measure their just equality, or the least differences. For those other simple ideas being appearances or sensations, produced in us by the size, figure, number, and motion of minute corpuscles singly insensible, their different degrees also depend upon the variation of some or all of those causes: which, since it cannot be observed by us in particles of matter, whereof each is too subtile to be perceived, it is impossible for us to have any exact measures of the different degrees of these simple ideas. For supposing the sensation or idea we name whiteness, be produced in us by a certain number of globules, which having a verticity about their own centres, strike upon the retina of the eye with a certain degree of rotation, as well as progressive swiftness; it will hence easily follow that the more the superficial parts of any body are so ordered, as to reflect the greater number of globules of light, and to give them the proper rotation, which is fit to produce this sensation of white in us, the more white will that body appear, that from an equal space sends to the retina the greater number of such corpuscles, with that peculiar sort of motion. I do not say, that the nature of light consists in very small round globules, nor of whiteness, in such a texture of parts as gives a certain rotation to these globules, when it reflects them; for I am not now treating physically of light or colours: but this I think, I may say, that I cannot (and I would be glad any one would make intelligible that he did) conceive how bodies without us can any ways affect our senses, but by the immediate contact of the sensible bodies themselves, as in tasting and feeling, or the impulse of some insensible particles coming from them, as in seeing, hearing, and smelling; by the different impulse of which parts, caused by their different size, figure, and motion, the variety of sensations is produced in us.

§ 12. Whether then they be globules, or no; or whether they have a verticity about their own centres, that produces the idea of whiteness

in us ; this is certain, that the more particles of light are reflected from a body, fitted to give them that peculiar motion, which produces the sensation of whiteness in us ; and possibly, too, the quicker that peculiar motion is, the whiter does the body appear, from which the greater number are reflected, as is evident in the same piece of paper put in the sun-beams, in the shade, and in a dark hole ; in each of which, it will produce in us the idea of whiteness in far different degrees.

§ 13. Not knowing therefore what number of particles, nor what motion of them, is fit to produce any precise degree of whiteness, we cannot demonstrate the certain equality of any two degrees of whiteness, because we have no certain standard to measure them by, nor means to distinguish every the least real difference, the only help we have, being from our senses, which in this point fails us. But where the difference is so great, as to produce in the mind clearly distinct ideas, whose differences can be perfectly retained, there these ideas of colours, as we see in different kinds, as blue and red, are as capable of demonstration, as ideas of number and extension. What I have here said of whiteness and colours, I think, holds true in all secondary qualities, and their modes.

§ 14. *Sensitive knowledge of particular existence.*—These two, viz. intuition and demonstration, are the degrees of our knowledge ; whatever comes short of one of these, with what assurance soever embraced, is but faith, or opinion, but not knowledge, at least in all general truths. There is, indeed, another perception of the mind, employed about the particular existence of finite beings without us ; which going beyond bare probability, and yet not reaching perfectly to either of the foregoing degrees of certainty, passes under the name of knowledge. There can be nothing more certain, than that the idea we receive from an external object, is in our minds ; this is intuitive knowledge. But whether there be any thing more than barely that idea in our minds, whether we can thence certainly infer the existence of any thing without us, which corresponds to that idea, is that, whereof some men think there may be a question made, because men may have such ideas in their minds, when no such thing exists, no such object affects their senses. But yet here, I think, we are provided with an evidence, that puts us past doubting : for I ask any one, whether he be not invincibly conscious to himself of a different perception, when he looks on the sun by day, and thinks on it by night ; when he actually tastes wormwood, or smells a rose, or only thinks on that savour, or odour ? We as plainly find the difference there is between an idea revived in our minds by our own memory, and actually coming in our minds by our senses, as we do between any two distinct ideas. If any one say, a dream may do the same thing, and all these ideas may be produced in us without any external objects, he may please to dream that I make him this answer : *First*, That it is no great matter, whether I remove this scruple, or no : where all is but dream, reasoning and arguments are of no use ; truth and knowledge nothing. *Secondly*, That I believe he will allow a very manifest difference between dreaming of being in the fire, and being actually in it. But yet if he be resolved to appear so sceptical, as to maintain, that what I call being actually in the fire, is nothing but a dream ; and we

cannot thereby certainly know, that any such thing as fire actually exists without us; I answer, that we certainly find, that pleasure or pain follows upon the application of certain objects to us, whose existence we perceive, or dream that we perceive, by our senses: this certainly is as great as our happiness or misery, beyond which, we have no concernment to know, or to be. So that, I think, we may add to the two former sorts of knowledge, this also, of the existence of particular external objects, by that perception and consciousness we have of the actual entrance of ideas from them, and allow these three degrees of knowledge, viz. intuitive, demonstrative, and sensitive: in each of which, there are different degrees and ways of evidence and certainty.

§ 15. *Knowledge not always clear, where the ideas are so.*—But since our knowledge is founded on, and employed about, our ideas only, will it not follow from thence, that it is conformable to our ideas; and that where our ideas are clear and distinct, or obscure and confused, our knowledge will be so too? To which I answer, No: for our knowledge consisting in the perception of the agreement or disagreement of any two ideas, its clearness or obscurity, consists in the clearness or obscurity of that perception, and not in the clearness or obscurity of the ideas themselves: v. g. a man that has as clear ideas of the angles of a triangle, and of equality to two right ones, as any mathematician in the world, may yet have but a very obscure perception of their agreement, and so have but a very obscure knowledge of it. But ideas which, by reason of their obscurity or otherwise, are confused, cannot produce any clear or distinct knowledge; because as far as any ideas are confused, so far the mind cannot perceive clearly, whether they agree or disagree. Or to express the same thing in a way less apt to be misunderstood. He that hath not determined ideas to the words he uses, cannot make propositions of them, of whose truth he can be certain.

CHAP. III.

OF THE EXTENT OF HUMAN KNOWLEDGE.

§ 1. Knowledge, as has been said, lying in the perception of the agreement or disagreement of any of our ideas, it follows from hence, that,

First, no farther than we have ideas.—*First,* We can have knowledge no farther than we have ideas.

§ 2. *Secondly, no farther than we can perceive their agreement or disagreement.*—*Secondly,* That we can have no knowledge farther than we can have perception of their agreement, or disagreement: which perception being, 1. Either by intuition, or the immediate comparing any two ideas; or, 2. By reason, examining the agreement or disagreement of two ideas, by the intervention of some others: or, 3. By sensation, perceiving the existence of particular things. Hence it also follows,

§ 3. *Thirdly, intuitive knowledge extends itself not to all the relations of all our ideas.*—*Thirdly,* That we cannot have an intuitive knowledge, that shall extend itself to all our ideas, and all that we

would know about them; because we cannot examine and perceive all the relations they have one to another by juxta-position, or an immediate comparison one with another. Thus having the ideas of an obtuse and an acute angled triangle, both drawn from equal bases, and between parallels, I can, by intuitive knowledge, perceive the one not to be the other; but cannot that way know, whether they be equal, or no; because their agreement or disagreement in equality can never be perceived by an immediate comparing them: the difference of figure makes their parts incapable of an exact immediate application; and therefore there is need of some intervening qualities to measure them by, which is demonstration, or rational knowledge.

§ 4. *Fourthly, nor demonstrative knowledge.*—*Fourthly*, It follows also, from what is above observed, that our rational knowledge cannot reach to the whole extent of our ideas: because between two different ideas we would examine, we cannot always find such mediums, as we can connect one to another with an intuitive knowledge, in all the parts of the deduction; and wherever that fails, we come short of knowledge and demonstration.

§ 5. *Fifthly, sensitive knowledge narrower than either.*—*Fifthly*, Sensitive knowledge reaching no farther than the existence of things actually present to our senses, is yet much narrower than either of the former.

§ 6. *Sixthly, our knowledge therefore narrower than our ideas.*—*Sixthly*, From all which, it is evident, that the extent of our knowledge comes not only short of the reality of things, but even of the extent of our own ideas. Though our knowledge be limited to our ideas, and cannot exceed them either in extent or perfection; and though these be very narrow bounds, in respect of the extent of All-Being, and far short of what we may justly imagine to be in some even created understandings, not tied down to the dull and narrow information which is to be received from some few, and not very acute, ways of perception, such as are our senses; yet it would be well with us, if our knowledge were but as large as our ideas, and there were not many doubts and inquiries concerning the ideas we have, whereof we are not, nor I believe ever shall be in this world, resolved. Nevertheless, I do not question but that human knowledge, under the present circumstances of our beings and constitutions, may be carried much farther than it hitherto has been, if men would sincerely, and with freedom of mind, employ all that industry and labour of thought, in improving the means of discovering truth, which they do for the colouring or support of falsehood, to maintain a system, interest, or party, they are once engaged in. But yet, after all, I think I may, without injury to human perfection, be confident, that our knowledge would never reach to all we might desire to know concerning those ideas we have; nor be able to surmount all the difficulties, and resolve all the questions, that might arise concerning any of them. We have the ideas of a square, a circle, and equality; and yet, perhaps, shall never be able to find a circle equal to a square, and certainly know that it is so. We have the ideas of matter and thinking,*

* Against that assertion of Mr. Locke, that “possibly we shall never be able to know, whether any mere material being think or no,” &c. the Bishop of Worcester argues thus:

but possibly shall never be able to know, whether any mere material being thinks or no; it being impossible for us, by the contemplation of our own ideas, without revelation, to discover, whether Omnipotency

“ If this be true, then, for all that we can know by our ideas of matter and thinking, matter may have a power of thinking: and, if this hold, then it is impossible to prove a spiritual substance in us from the idea of thinking: for how can we be assured by our ideas, that God hath not given such a power of thinking to matter so disposed as our bodies are? especially since it is said,^a ‘ That, in respect of our notions, it is not much more remote from our comprehension to conceive that God can, if he pleases, superadd to our idea of matter a faculty of thinking, than that he should superadd to it another substance, with a faculty of thinking.’ Whoever asserts this, can never prove a spiritual substance in us from a faculty of thinking, because he cannot know, from the idea of matter and thinking, that matter so disposed cannot think: and he cannot be certain, that God hath not framed the matter of our bodies so as to be capable of it.”

To which Mr. Locke^b answers thus: “ Here your lordship argues, that upon my principles it cannot be proved that there is a spiritual substance in us. To which, give me leave, with submission, to say, that I think it may be proved from my principles, and I think I have done it; and the proof in my book stands thus: *First*, we experiment in ourselves thinking. The idea of this action, or mode of thinking, is inconsistent with the idea of self-substance, and, therefore, has a necessary connexion with a support or subject of inhesion: the idea of that support is what we call substance; and so from thinking experimented in us, we have a proof of a thinking substance in us, which in my sense is a spirit. Against this your lordship will argue, that, by what I have said of the possibility that God may, if he pleases, superadd to matter a faculty of thinking, it can never be proved that there is a spiritual substance in us, because, upon that supposition, it is possible it may be a material substance that thinks in us. I grant it; but add, that the general idea of substance being the same every where, the modification of thinking, or the power of thinking, joined to it, makes it a spirit, without considering what other modifications it has, as whether it has the modification of solidity or no. As, on the other side, substance, that has the modification of solidity, is matter, whether it has the modification of thinking, or no. And, therefore, if your lordship means by a spiritual, an immaterial, substance, I grant I have not proved, nor upon my principles can it be proved (your lordship meaning, as I think you do, demonstratively proved), that there is an immaterial substance in us that thinks. Though, I presume, from what I have said about this supposition of a system of matter, thinking^c (which there demonstrates that God is immaterial), will prove it in the highest degree probable, that the thinking substance in us is immaterial. But your lordship thinks not probably enough, and by charging the want of demonstration upon my principle, that the thinking thing in us is immaterial, your lordship seems to conclude it demonstrable from principles of philosophy. The demonstration I should with joy receive from your lordship, or any one. For though all the great ends of morality or religion are well enough secured without it, as I have shewn,^d yet it would be a great advance of our knowledge in nature and philosophy.

“ To what I have said in my book, to shew that all the great ends of religion and morality are secured barely by the immortality of the soul, without a necessary supposition that the soul is immaterial, I crave leave to add, that immortality may, and shall be, annexed to that, which in its own nature is neither immaterial nor immortal, as the apostle expressly declares in these words,^e ‘ For this corruptible must put on incorruption, and this mortal must put on immortality.’

“ Perhaps my using the word spirit for a thinking substance, without excluding materiality out of it, will be thought too great a liberty, and such as deserves censure, because I leave immateriality out of the idea I make it a sign of. I readily own, that words should be sparingly ventured on in a sense wholly new; and nothing but absolute necessity can excuse the boldness of using any term in a sense whereof we can produce no example. But, in the present case, I think I have great authorities to justify me. The soul is agreed, on all hands, to be that in us which thinks. And he that will look into the book of Cicero’s *Tusculan Questions*, and into the sixth book of Virgil’s *Æneid*, will find that these two great men, who, of all the Romans, best understood philosophy, thought, or at least did not deny, the soul to be a subtile matter, which might come under the name of *aura*, or *ignis*, or *ather*; and this soul, they both of them called *spiritus*: in the notion of which, it is plain, they included only thought and active motion, without the total exclusion of matter. Whether they thought right in this, I do not say; that is not the question; but whether they spoke properly, when they called an active, thinking, subtile substance, out of which they excluded

^e 1 Cor. xv. 53.

has not given to some systems of matter fitly disposed, a power to perceive and think, or else joined and fixed to matter so disposed, a thinking immaterial substance: it being, in respect of our notions, not much

only gross and palpable matter, *spiritus*, spirit. I think that nobody will deny, that if any among the Romans can be allowed to speak properly, Tully and Virgil are the two who may most securely be depended on for it: and one of them, speaking of the soul, says, *Dum spiritus hos reget artus*; and the other, *Vita continetur corpore et spiritu*. Where it is plain by *corpus*, he means (as generally every where) only gross matter that may be felt and handled, as appears by these words: *Si cor, aut sanguis, aut cerebrum est animus: certe, quoniam est corpus, interibit cum reliquo corpore; si anima est, forte dissipabitur: si ignis, extinguetur*, Tusc. Quæst. l. 1. c. 11. Here Cicero opposes *corpus* to *ignis* and *anima*, i. e. *aura*, or breath. And the foundation of that his distinction of the soul, from that which he calls *corpus* or body, he gives a little lower in these words: *Tanta ejus tenuitas ut fugiat aciem*, *ibid.* c. 22. Nor was it the heathen world alone that had this notion of spirit; the most enlightened of all the ancient people of God, Solomon himself, speaks after the same manner:^a 'That which befallerh the sons of men, befallerh beasts; even one thing befallerh them; as the one dieth, so dieth the other; yea, they have all one spirit.' So I translate the Hebrew word *רוח*, here, for so I find it translated the very next verse but one:^b 'Who knoweth the spirit of man that goeth upward, and the spirit of the beast that goeth downwards to the earth?' In which places, it is plain, that Solomon applies the word *רוח*, and our translators of him the word spirit, to a substance, out of which materiality was not wholly excluded, unless the spirit of a beast that goeth downwards to the earth, be immaterial. Nor did the way of speaking in our Saviour's time vary from this: St. Luke tells us,^c 'That when our Saviour, after his resurrection, stood in the midst of them, they were affrighted, and supposed that they had seen *πνεῦμα*,' the Greek word which always answers spirit in English: and so the translators of the Bible render it here, they supposed that they had seen a spirit. But our Saviour says to them, 'Behold my hands and my feet, that it is I myself; handle me, and see; for a spirit hath not flesh and bones, as you see me have.' Which words of our Saviour put the same distinction between body and spirit, that Cicero did in the place above cited, viz. That the one was a gross compages that could be felt and handled; and the other such as Virgil describes the ghost or soul of Anchises.

' Ter conatus ibi collo dare brachia circum,
Ter frustra compressa manus effugit imago,
Par levibus ventis volucrique simillima somno.'^d

'I would not be thought hereby to say, that spirit never does signify a purely immaterial substance. In that sense the scripture, I take it, speaks, when it says God is a spirit; and in that sense I have used it; and in that sense I have proved from my principles that there is a spiritual substance, and am certain that there is a spiritual immaterial substance: which is, I humbly conceive, a direct answer to your lordship's question in the beginning of this argument, viz. How we come to be certain that there are spiritual substances, supposing this principle to be true, that the simple ideas by sensation and reflection, are the sole matter and foundation of all our reasoning? But this hinders not, but that if God, that infinite, omnipotent, and perfectly immaterial Spirit, should please to give a system of very subtle matter, sense and motion, it might with propriety of speech be called spirit, though materiality were not excluded out of its complex idea. Your lordship proceeds: 'It is said, indeed, elsewhere,^e that it is repugnant to the idea of senseless matter, that it should put into itself sense, perception, and knowledge.' But this does not reach the present case: which is not what matter can do of itself, but what matter prepared by an omnipotent hand can do. And what certainty can we have that he hath not done it? We can have none from the ideas, for those are given up in this case, and consequently we can have no certainty, upon these principles, whether we have any spiritual substance within us or not.'

'Your lordship in this paragraph proves, that, from what I say, we can have no certainty whether we have any spiritual substance in us or not. If by spiritual substance, your lordship means an immaterial substance in us, as you speak, I grant what your lordship says is true, that it cannot upon these principles be demonstrated. But I must crave leave to say at the same time, that upon these principles it can be proved, to the highest degree of probability. If by spiritual substance, your lordship means a thinking substance, I must dissent from your lordship, and say, that we can have a certainty, upon my principles, that there is a spiritual substance in us. In short, my lord, upon my principles, i. e. from the idea of thinking, we can have a certainty that there is a thinking substance in us; from hence we have a certainty that there is an eternal thinking substance. This thinking substance, which has been from eternity, I have proved to be immaterial. This eternal, immaterial, thinking

^a Eccl. iii. 19.^b *Ibid* 21.^c Chap. xxiv. 37.^d *Lib.* vi.^e B. 4. c. 10. § 5.

more remote from our comprehension to conceive that God can, if he pleases, superadd to matter a faculty of thinking, than that he should superadd to it another substance, with a faculty of thinking; since we

substance, has put into us a thinking substance, which, whether it be a material or immaterial substance, cannot be infallibly demonstrated from our ideas: though from them it may be proved, that it is to the highest degree probable that it is immaterial."

Again, the Bishop of Worcester undertakes to prove from Mr. Locke's principles, that we may be certain, "That the first eternal thinking Being, or omnipotent Spirit, cannot, if he would, give to certain systems of created sensible matter, put together as he sees fit, some degrees of sense, perception, and thought."

To which, Mr. Locke has made the following answer in his third letter.

"Your first argument I take to be this; that according to me, the knowledge we have being by our ideas, and our idea of matter in general being a solid substance, and our idea of body a solid extended figured substance; if I admit matter be capable of thinking, I confound the idea of matter with the idea of a spirit; to which I answer, No; no more than I confound the idea of matter with the idea of a horse, when I say that matter in general is a solid extended substance; and that a horse is a material animal, or an extended solid substance, with sense and spontaneous motion.

"The idea of matter is an extended solid substance; wherever there is such a substance, there is matter; and the essence of matter, whatever other qualities, not contained in that essence, it shall please God to superadd to it. For example: God creates an extended solid substance, without the superadding any thing else to it, and so we may consider it at rest: to some parts of it he superadds motion, but it has still the essence of matter; other parts of it he frames into plants, with all the excellencies of vegetation, life, and beauty, which is to be found in a rose or peach tree, &c. above the essence of matter in general, but it is still but matter: to other parts he adds sense and spontaneous motion, and those other properties that are to be found in an elephant. Hitherto it is not doubted but the power of God may go, and that the properties of a rose, a peach, or an elephant, superadded to matter, change not the properties of matter; but matter is in these things matter still. But if one venture to go one step farther, and say, God may give to matter thought, reason, and volition, as well as sense and spontaneous motions, there are men ready presently to limit the power of the omnipotent Creator, and tell us he cannot do it; because it destroys the essence, or changes the essential properties of matter. To make good which assertion, they have no more to say, but that thought and reason are not included in the essence of matter. I grant it; but whatever excellency, not contained in its essence, be superadded to matter, it does not destroy the essence of matter, if it leaves it an extended solid substance: wherever that is, there is the essence of matter: and if every thing of greater perfection, superadded to such a substance, destroys the essence of matter, what will become of the essence of matter in a plant or an animal, whose properties far exceed those of a mere extended solid substance?

"But it is farther urged, that we cannot conceive how matter can think. I grant it: but to argue from thence, that God, therefore, cannot give to matter a faculty of thinking, is to say, God's omnipotency is limited to a narrow compass, because man's understanding is so; and brings down God's infinite power to the size of our capacities. If God can give no power to any parts of matter, but what men can account for from the essence of matter in general; if all such qualities and properties must destroy the essence, or change the essential properties, of matter, which are to our conceptions above it, and we cannot conceive to be the natural consequence of that essence; it is plain, that the essence of matter is destroyed, and its essential properties changed, in most of the sensible parts of this our system. For it is visible, that all the planets have revolutions about certain remote centres, which I would have any one explain, or make conceivable by the bare essence, or natural powers depending on the essence of matter in general, without something added to that essence, which we cannot conceive; for the moving of matter in a crooked line, or the attraction of matter by matter, is all that can be said in the case; either of which it is above our reach to derive from the essence of matter or body in general; though one of these two must unavoidably be allowed to be superadded in this instance to the essence of matter in general. The omnipotent Creator advised not with us in the making of the world, and his ways are not the less excellent, because they are past finding out.

"In the next place, the vegetable part of the creation is not doubted to be wholly material; and yet he that will look into it will observe excellencies and operations in this part of matter, which he will not find contained in the essence of matter in general, nor be able to conceive how they can be produced by it. And will he therefore say, that the essence of matter is destroyed in them, because they have properties and operations not contained in the essential properties of matter as matter, nor explicable by the essence of matter in general?

know not wherein thinking consists, nor to what sort of substances the Almighty has been pleased to give that power, which cannot be in any created being, but merely by the good pleasure and bounty of the Cre-

“Let us advance one step farther, and we shall in the animal world meet with yet greater perfections and properties, no ways explicable by the essence of matter in general. If the omnipotent Creator had not superadded to the earth, which produced the irrational animals, qualities far surpassing those of the dull dead earth, out of which they were made, life, sense, and spontaneous motion, nobler qualities than were before in it, it had still remained rude senseless matter; and if to the individuals of each species he had not superadded a power of propagation, the species had perished with those individuals; but by these essences or properties of each species, superadded to the matter which they were made of, the essence or properties of matter in general were not destroyed or changed any more than any thing that was in the individuals before, was destroyed or changed by the power of generation, superadded to them by the first benediction of the Almighty.

“In all such cases, the superinducement of greater perfections and nobler qualities destroys nothing of the essence or perfections that were there before; unless there can be shewed a manifest repugnancy between them: but all the proof offered for that, is only, that we cannot conceive how matter, without such superadded perfections, can produce such effects; which is, in truth, no more than to say, matter in general, or every part of matter, as matter, has them not; but is no reason to prove, that God, if he pleases, cannot superadd them to some parts of matter, unless it can be proved to be a contradiction, that God should give to some parts of matter qualities and perfections, which matter in general has not; though we cannot conceive how matter is invested with them, or how it operates by virtue of those new endowments: nor is it to be wondered that we cannot, whilst we limit all its operations to those qualities it had before, and would explain them by the known properties of matter in general, without any such induced perfections. For, if this be a right rule of reasoning, to deny a thing to be, because we cannot conceive the manner how it comes to be; I shall desire them who use it, to stick to this rule, and see what work it will make both in divinity as well as philosophy: and whether they can advance any thing more in favour of scepticism.

“For to keep within the present subject of the power of thinking and self-motion, bestowed by omnipotent Power in some parts of matter: the objection to this is, I cannot conceive how matter should think. What is the consequence? *ergo*, God cannot give it a power to think. Let this stand for a good reason, and then proceed in other cases by the same. You cannot conceive how matter can attract matter at any distance, much less at the distance of 1,000,000 of miles; *ergo*, God cannot give it such a power: you cannot conceive how matter should feel, or move itself, or affect an immaterial being, or be moved by it; *ergo*, God cannot give it such powers: which is, in effect, to deny gravity, and the revolution of the planets about the sun; to make brutes mere machines, without sense or spontaneous motion; and to allow man neither sense nor voluntary motion.

“Let us apply this rule one degree farther. You cannot conceive how an extended solid substance should think; therefore, God cannot make it think: can you conceive how your own soul, or any substance, thinks? You find indeed that you do think, and so do I; but I want to be told how the action of thinking is performed: this, I confess, is beyond my conception; and I would be glad any one, who conceives it, would explain it to me. God, I find, has given me this faculty; and since I cannot but be convinced of his power in this instance, which though I every moment experiment in myself, yet I cannot conceive the manner of; what would it be less than an insolent absurdity, to deny his power in other like cases, only for this reason, because I cannot conceive the manner how?

“To explain this matter a little farther: God has created a substance; let it be, for example, a solid extended substance. Is God bound to give it, besides being, a power of action? that, I think, nobody will say: he, therefore, may leave it in a state of inactivity, and it will be nevertheless a substance; for action is not necessary to the being of any substance that God does create. God has likewise created and made to exist, *de novo*, an immaterial substance, which will not lose its being of a substance, though God should bestow on it nothing more but this bare being, without giving it any activity at all. Here are now two distinct substances, the one material, the other immaterial, both in a state of perfect inactivity. Now I ask, what power God can give to one of these substances (supposing them to retain the same distinct natures that they had as substances in their state of inactivity), which he cannot give to the other? In that state, it is plain, neither of them thinks; for thinking being an action, it cannot be denied, that God can put an end to an action of any created substance, without annihilating of the substance whereof it is an action; and if it be so, he can also create or give existence to such a substance, without giving that substance any action at all. By the same reason it is plain, that neither of them can move itself: now I would ask, why Omnipotency cannot give to either of these substances, which are equally

ator. For I see no contradiction in it, that the first eternal thinking Being should, if he pleased, give to certain systems of created senseless matter, put together as he thinks fit, some degrees of sense, per-

in a state of perfect inactivity, the same power that it can give to the other? Let it be, for example, that of spontaneous or self-motion, which is a power that it is supposed God can give to an unsolid substance, but denied that he can give to solid substance.

“If it be asked, why they limit the omnipotency of God in reference to the one rather than the other of these substances? all that can be said to it is, that they cannot conceive, how the solid substance should ever be able to move itself. And as little, say I, are they able to conceive how a created unsolid substance should move itself. But there may be something in an immaterial substance, that you do not know. I grant it; and in a material one too: for example, gravitation of matter towards matter, and in the several proportions observable, inevitably shews, that there is something in matter that we do not understand, unless we can conceive self-motion in matter; or an inexplicable and inconceivable attraction in matter, at immense, almost incomprehensible, distances; it must, therefore, be confessed, that there is something in solid, as well as unsolid, substances, that we do not understand. But this we know, that they may each of them have their distinct beings, without any activity superadded to them, unless you will deny, that God can take from any being its power of acting, which it is probable will be thought too presumptuous for any one to do; and, I say, it is as hard to conceive self-motion in a created immaterial, as in a material being, consider it how you will: and, therefore, this is no reason to deny Omnipotency to be able to give a power of self-motion to a material substance, if he pleases, as well as to an immaterial; since neither of them can have it from themselves, nor can we conceive how it can be in either of them.

“The same is visible in the other operation of thinking: both these substances may be made and exist without thought; neither of them has, or can have, the power of thinking from itself; God may give it to either of them, according to the good pleasure of his omnipotency; and in whichever of them it is, it is equally beyond our capacity to conceive, how either of these substances thinks. But for that reason, to deny that God, who had power enough to give them both a being out of nothing, can, by the same omnipotency, give them what other powers and perfections he pleases, has no better foundation than to deny his power of creation, because we cannot conceive how it is performed: and there, at last, this way of reasoning must terminate.

“That Omnipotency cannot make a substance to be solid and not solid at the same time, I think with due reverence we may say; but that a solid substance may not have qualities, perfections, and powers, which have no natural or visibly necessary connexion with solidity and extension is too much for us (who are but of yesterday, and know nothing) to be positive in. If God cannot join things together by connexions inconceivable to us, we must deny even the consistency and being of matter itself; since every particle of it having some bulk, has its parts connected by ways inconceivable to us. So that all the difficulties that are raised against the thinking of matter, from our ignorance, or narrow conceptions, stand not at all in the way of the power of God, if he pleases to ordain it so; nor prove any thing against his having actually endued some parcels of matter, so disposed as he thinks fit, with a faculty of thinking, till it can be shewn, that it contains a contradiction to suppose it.

“Though to me sensation be comprehended under thinking in general, yet, in the foregoing discourse, I have spoke of sense in brutes, as distinct from thinking; because your lordship, as I remember, speaks of sense in brutes. But here I take liberty to observe, that if your lordship allows brutes to have sensation, it will follow, either that God can and doth give to some parcels of matter a power of perception and thinking; or that all animals have immaterial, and consequently, according to your lordship, immortal souls, as well as men; and to say that fleas and mites, &c. have immortal souls as well as men, will possibly be looked on as going a great way to serve an hypothesis.

“I have been pretty large in making this matter plain, that they who are so forward to bestow hard censures or names on the opinions of those who differ from them, may consider whether sometimes they are not more due to their own; and that they may be persuaded a little to temper that heat, which, supposing the truth in their current opinions, gives them (as they think) a right to lay what imputations they please on those who would fully examine the grounds they stand upon. For talking with a supposition and insinuations, that truth and knowledge, nay, and religion too, stand and fall with their systems, is at best but an imperious way of begging the question, and assuming to themselves, under the pretence of zeal for the cause of God, a title to infallibility. It is very becoming that men's zeal for truth should go as far as their proofs, but not go for proofs themselves. He that attacks received opinions with any thing but fair arguments, may, I own, be justly suspected not to mean well, nor to be led by the love of truth; but the same may be said of him too, who so defends them. An error is not the better for being common, nor truth the worse for having

ception, and thought: though, as I think, I have proved, lib. 4. c. 10. § 14. it is no less than a contradiction to suppose matter (which is evidently in its own nature void of sense and thought) should be that

lain neglected; and if it were put to the vote any where in the world, I doubt, as things are managed, whether truth would have the majority, at least whilst the authority of men, and not the examination of things, must be its measure. The imputation of scepticism, and those broad insinuations to render what I have writ suspected, so frequent, as if that were the great business of all this pains you have been at about me, has made me say thus much, my lord, rather as my sense of the way to establish truth in its full force and beauty, than that I think the world will need to have any thing said to it, to make it distinguish between your lordship's and my design in writing, which, therefore, I securely leave to the judgment of the reader, and return to the argument in hand.

“What I have above said, I take to be a full answer to all that your lordship would infer from my idea of matter, of liberty, of identity, and from the power of abstracting. You ask,^a ‘How can my idea of liberty agree with the idea that bodies can operate only by motion and impulse?’ Ans. By the omnipotency of God, who can make all things agree, that involve not a contradiction. It is true, I say,^b That bodies operate by impulse, and nothing else. And so I thought when I writ it, and can yet conceive no other way of their operation. But I am since convinced by the judicious Mr. Newton's incomparable book, that it is too bold a presumption to limit God's power in this point by my narrow conceptions. The gravitation of matter towards matter, by ways unconceivable to me, is not only a demonstration that God can, if he pleases, put into bodies powers, and ways of operation, above what can be derived from our idea of body, or can be explained by what we know of matter; but also an unquestionable, and every where visible, instance, that he has done so. And, therefore, in the next edition of my book, I will take care to have that passage rectified.

“As to self-consciousness, your lordship asks,^c ‘What is there like self-consciousness in matter?’ Nothing at all in matter, as matter. But that God cannot bestow on some parcels of matter a power of thinking, and with it self-consciousness, will never be proved by asking,^d how is it possible to apprehend that mere body should perceive that it doth perceive? The weakness of our apprehension, I grant in the case: I confess as much as you please, that we cannot conceive how a solid, no, nor how an unsolid, created substance thinks; but this weakness of our apprehension reaches not the power of God, whose weakness is stronger than any thing in men.

“Your argument from abstraction, we have in this question,^e ‘If it may be in the power of matter to think, how comes it to be so impossible for such organized bodies as the brutes have, to enlarge their ideas by abstraction?’ Ans. This seems to suppose, that I place thinking within the natural power of matter. If that be your meaning, my lord, I never say nor suppose, that all matter has naturally in it a faculty of thinking, but the direct contrary. But if you mean that certain parcels of matter, ordered by the Divine Power, as seems fit to him, may be made capable of receiving from his omnipotency the faculty of thinking; that, indeed, I say; and that being granted, the answer to your question is easy; since, if omnipotency can give thought to any solid substance, it is not hard to conceive, that God may give that faculty in a higher or lower degree, as it pleases him, who knows what disposition of the subject is suited to such a particular way or degree of thinking.

“Another argument to prove, that God cannot endue any parcel of matter with the faculty of thinking, is taken from those words of mine,^f where I shew, by what connexion of ideas we may come to know, that God is an immaterial substance. They are these, ‘The idea of an eternal actual knowing being, with the idea of immateriality, by the intervention of the idea of matter, and of its actual division, divisibility, and want of perception,’ &c. From whence your lordship thus argues: ‘Here the want of perception is owned to be so essential to matter, that God is therefore concluded to be immaterial.’ Ans. Perception and knowledge in that one eternal Being, where it has its source, it is visible must be essentially inseparable from it: therefore the actual want of perception in so great a part of the particular parcels of matter, is a demonstration, that the first being, from whom perception and knowledge are inseparable, is not matter: how far this makes the want of perfection an essential property of matter, I will not dispute; it suffices that it shews, that perception is not an essential property of matter; and therefore matter cannot be that eternal original being to which perception and knowledge are essential. Matter, I say, naturally is without perception: *ergo*, says your lordship, ‘want of perception is an essential property of matter, and God does not change the essential properties of things, their nature remaining.’ From whence you infer, that God cannot bestow on any parcel of matter (the nature of matter remaining) a faculty of thinking. If the rules of logic, since my days, be not changed, I

eternal first-thinking Being. What certainty of knowledge can any one have that some perceptions, such as, v. g. pleasure and pain, should not be in some bodies themselves, after a certain manner, modified and

may safely deny this consequence. For an argument that runs thus, God does not; *ergo*, he cannot, I was taught, when I first came to the university, would not hold. For I never said God did; but,^a 'That I see no contradiction in it, that he should, if he pleased, give to some systems of senseless matter, a faculty of thinking; and I know nobody before Des Cartes, that ever pretended to shew that there was any contradiction in it. So that at worst, my not being able to see in matter any such incapacity as makes it impossible for Omnipotency to bestow on it a faculty of thinking, makes me opposite only to the Cartesians. For as far as I have seen or heard, the fathers of the Christian church never pretended to demonstrate, that matter was incapable to receive a power of sensation, perception, and thinking, from the hand of the omnipotent Creator. Let us therefore, if you please, suppose the form of your argumentation right, and that your lordship means, 'God cannot:' and then, if your argument be good, it proves, 'That God could not give to Balaam's ass a power to speak to his master, as he did, for the want of rational discourse being natural to that species; it is but for your lordship to call it an essential property, and then God cannot change the essential properties of things, their nature remaining: whereby it is proved, 'That God cannot, with all his omnipotency, give to an ass a power to speak, as Balaam's did.'

"You say^b my lord, 'You do not set bounds to God's omnipotency. For he may if he please, change a body into an immaterial substance,' i. e. take away from a substance the solidity which it had before, and which made it matter, and then give it a faculty of thinking, which it had not before, and which makes it a spirit, the same substance remaining. For if the same substance remains not, body is not changed into an immaterial substance. But the solid substance, and all belonging to it, is annihilated, and an immaterial substance created, which is not a change of one thing into another, but the destroying of one, and making another *de novo*. In this change, therefore, of a body or material substance into an immaterial, let us observe these distinct considerations.

"First, you say, 'God may, if he pleases, take away from a solid substance, solidity, which is that which makes it a material substance or body; and may make it an immaterial substance, i. e. a substance without solidity. But this privation of one quality gives it not another; the bare taking away a lower or less noble quality, does not give it an higher or nobler; that must be the gift of God. For the bare privation of one, and a meaner quality, cannot be the position of a higher and better: unless any one will say, that cogitation, or the power of thinking, results from the nature of substance itself; which if it do, then wherever there is substance, there must be cogitation, or a power of thinking.' Here, then, upon your lordship's own principles, is an immaterial substance without the faculty of thinking.

"In the next place, you will not deny, but God may give to this substance, thus deprived of solidity, a faculty of thinking; for you suppose it made capable of that by being made immaterial; whereby you allow, that the same numerical substance may be sometimes wholly incogitative, or without a power of thinking, and at other times perfectly cogitative, or endued with a power of thinking.

"Further, you will not deny, but God can give it solidity, and make it material again. For I conclude it will not be denied, that God can make it again what it was before. Now I crave leave to ask your lordship, why God having given to this substance the faculty of thinking, after solidity was taken from it, cannot restore to it solidity again, without taking away the faculty of thinking? When you have resolved this, my lord, you will have proved it impossible for God's omnipotency to give to a solid substance a faculty of thinking; but till then, not having proved it impossible, and yet denying that God can do it, is to deny that he can do, what is in itself possible; which, as I humbly conceive, is visibly to set bounds to God's omnipotency, though you say here,^c 'you do not set bounds to God's omnipotency.'

"If I should imitate your lordship's way of writing, I should not omit to bring in Epicurus here, and take notice, that this was his way, *Deum verbis ponere, re tollere*; and then add, that I am certain you do not think he promoted the great ends of religion and morality. For it is with such candid and kind insinuations as these, that you bring in both Hobbes^d and Spinoza^e into your discourse here about God's being able, if he please, to give to some parcels of matter, ordered as he thinks fit, a faculty of thinking; neither of those authors having, as appears by any passage you bring out of them, said any thing to this question; nor having, as it seems, any other business here, but by their names, skilfully to give that character to my book, with which you would recommend it to the world.

"I pretend not to inquire what measure of zeal, nor for what, guides your lordship's pen

^e Ibid.

moved, as well as that they should be in an immaterial substance, upon the motion of the parts of body? Body, as far as we can conceive, being able only to strike and affect body? and motion, according to the utmost

in such a way of writing, as yours has all along been with me: only I cannot but consider, what reputation it would give to the writings of the fathers of the church, if they should think truth required, or religion allowed them to imitate, such patterns. But God be thanked, there be those amongst them, who do not admire such ways of managing the cause of truth or religion; they being sensible that if every one, who believes, or can pretend he hath truth on his side, is thereby authorized, without proof, to insinuate whatever may serve to prejudice men's minds against the other side, there will be a great ravage made on charity and practice, without any gain to truth and knowledge: and that the liberties frequently taken by disputants to do so, may have been the cause that the world in all ages has received so much harm, and so little advantage, from controversies in religion.

"These are the arguments which your lordship has brought to confute one saying in my book, by other passages in it; which therefore being all but *argumenta ad hominem*, if they did prove what they do not, are of no other use, than to gain a victory over me: a thing methinks so much beneath your lordship, that it does not deserve one of your pages. The question is, whether God can, if he pleases, bestow on any parcel of matter, ordered as he thinks fit, a faculty of perception and thinking. You say,^a 'you look upon a mistake herein to be of dangerous consequence as to the great ends of religion and morality.' If this be so, my lord, I think one may well wonder, why your lordship has brought no arguments to establish the truth itself, which you look on to be of such dangerous consequence to be mistaken in: but have spent so many pages only in a personal matter, in endeavouring to shew, that I had inconsistencies in my book; which if any such thing had been shewn, the question would be still as far from being decided, and the danger of mistaking about it as little prevented, as if nothing of all this had been said. If therefore your lordship's care of the great ends of religion and morality have made you think it necessary to clear this question, the world has reason to conclude there is little to be said against that proposition which is to be found in my book, concerning the possibility, that some parcels of matter might be so ordered by Omnipotence, as to be endued with a faculty of thinking, if God so pleased; since your lordship's concern for the promoting the great ends of religion and morality, has not enabled you to produce one argument against a proposition that you think of so dangerous consequence to them.

"And here I crave leave to observe, that though in your title page you promise to prove, that my notion of ideas is inconsistent with itself (which if it were, it could hardly be proved to be inconsistent with any thing else), and with the articles of the Christian faith; yet your attempts all along have been to prove me, in some passages of my book, inconsistent with myself, without having shewn any proposition in my book inconsistent with any article of the Christian faith.

"I think your lordship has indeed made use of one argument of your own: but it is such an one, that I confess I do not see how it is apt much to promote religion, especially the Christian religion, founded on revelation. I shall set down your lordship's words, that they may be considered: you say,^b 'that you are of opinion, that the great ends of religion and morality are best secured by the proofs of the immortality of the soul, from its nature and properties; and which you think prove it immaterial.' Your lordship does not question whether God can give immortality to a material substance; but you say it takes off very much from the evidence of immortality, if it depend wholly upon God's giving that, which of its own nature it is not capable of, &c. So likewise you say,^c 'If a man cannot be certain, but that matter may think (as I affirm), then what becomes of the soul's immateriality (and consequently immortality) from its operations? But for all this, say I, his assurance of faith remains on its own basis. Now you appeal to any man of sense, whether the finding the uncertainty of his own principles, which he went upon, in point of reason, doth not weaken the credibility of these fundamental articles, when they are considered purely as matters of faith? For before, there was a natural credibility in them on account of reason; but by going on wrong grounds of certainty, all that is lost; and instead of being certain, he is more doubtful than ever. And if the evidence of faith falls so much short of that of reason, it must needs have less effect upon men's minds, when the subserviency of reason is taken away; as it must be when the grounds of certainty by reason are vanished. Is it at all probable, that he who finds his reason deceive him in such fundamental points, shall have his faith stand firm and unmoveable on the account of revelation? For in matters of revelation, there must be some antecedent principles supposed, before we can believe any thing on the account of it.'

"More to the same purpose we have some pages farther, where, from some of my words, your lordship says,^d 'You cannot but observe, that we have no certainty upon my grounds,

^a First answer.

^b Ibid.

^c Second answer.

^d Ibid.

reach of our ideas, being able to produce nothing but motion; so that when we allow it to produce pleasure or pain, or the idea of a colour, or sound, we are fain to quit our reason, go beyond our ideas, and

that self-consciousness depends upon an individual immaterial substance, and consequently that a material substance may, according to my principles, have self-consciousness in it; at least, that I am not certain of the contrary.' Whereupon your lordship bids me consider, whether this does not a little affect the whole article of the resurrection? What does all this tend to, but to make the world believe, that I have lessened the credibility of the immortality of the soul, and the resurrection, by saying, that though it be most highly probable that the soul is immaterial, yet upon my principles it cannot be demonstrated; because it is not impossible to God's omnipotency, if he pleases, to bestow upon some parcels of matter, disposed as he sees fit, a faculty of thinking?

"This, your accusation of my lessening the credibility of these articles of faith, is founded on this, that the article of the immortality of the soul abates of its credibility, if it be allowed, that its immateriality (which is the supposed proof from reason and philosophy of its immortality) cannot be demonstrated from natural reason: which argument of your lordship's bottoms, as I humbly conceive, on this, that divine revelation abates of its credibility in all those articles it proposes, proportionably as human reason fails to support the testimony of God. And all that your lordship in those passages has said, when examined, will, I suppose, be found to import thus much, viz. does God propose any thing to mankind to be believed? It is very fit and credible to be believed, if reason can demonstrate it to be true. But if human reason comes short in the case, and cannot make it out, its credibility is thereby lessened; which is, in effect to say, that the veracity of God is not a firm and sure foundation of faith to rely upon, without the concurrent testimony of reason, i. e. with reverence be it spoken, God is not to be believed on his own word, unless what he reveals be in itself credible, and might be believed without him.

"If this be a way to promote religion, the Christian religion, in all its articles, I am not sorry that it is not a way to be found in any of my writings; for I imagine any thing like this would (and I should think deserve to) have other titles than bare scepticism bestowed upon it, and would have raised no small outcry against any one, who is not to be supposed to be in the right in all that he says, and so may securely say what he pleases. Such as I, the *prophanum vulgus*, who take too much upon us, if we should examine, have nothing to do but to hearken and believe, though what he said should subvert the very foundations of the Christian faith.

"What I have above observed, is so visibly contained in your lordship's argument, that when I met with it in your answer to my first letter, it seemed so strange for a man of your lordship's character, and in a dispute in defence of the doctrine of the Trinity, that I could hardly persuade myself, but it was a slip of your pen: but when I found it in your second letter^a made use of again, and seriously enlarged as an argument of weight to be insisted upon, I was convinced that it was a principle that you heartily embraced, how little favourable soever it was to the articles of the Christian religion, and particularly those which you undertook to defend.

"I desire my reader to peruse the passages as they stand in your letters themselves, and see whether what you say in them does not amount to this, that a revelation from God is more or less credible, according as it has a stronger or weaker confirmation from human reason. For,

"1. Your lordship says,^b 'You do not question whether God can give immortality to a material substance; but you say it takes off very much from the evidence of immortality, if it depends wholly upon God's giving that which of its own nature it is not capable of.'

"To which I reply, any one's not being able to demonstrate the soul to be immaterial, takes off not very much, nor at all, from the evidence of its immortality, if God has revealed, that it shall be immortal; because the veracity of God is a demonstration of the truth of what he has revealed, and the want of another demonstration of a proposition, that is demonstratively true, takes not off from the evidence of it. For where there is a clear demonstration, there is as much evidence as any truth can have, that is not self-evident. God has revealed, that the souls of men should live for ever. 'But,' says your lordship, 'from this evidence, it takes off very much, if it depends wholly upon God's giving that, which of its own nature it is not capable of,' i. e. the revelation and testimony of God loses much of its evidence, if it depends wholly upon the good pleasure of God, and cannot be demonstratively made out by natural reason, that the soul is immaterial, and consequently in its own nature immortal. For that is all that here is or can be meant by these words, 'which of its own nature it is not capable of,' to make them to the purpose. For the whole of your lordship's discourse here, is to prove, that the soul cannot be material, because then the evidence of its being immortal would be very much lessened. Which is

^a Second answer.

^b First answer.

attribute it wholly to the good pleasure of our Maker. For since we must allow he has annexed effects to motion, which we can no way conceive motion able to produce, what reason have we to conclude, that he

to say, that it is not as credible upon divine revelation, that a material substance should be immortal, as an immaterial; or, which is all one, that God is not equally to be believed, when he declares, that a material substance shall be immortal, as when he declares that an immaterial shall be so, because the immortality of a material substance cannot be demonstrated from natural reason.

“ Let us try this rule of your lordship’s a little farther: God hath revealed, that the bodies men shall have after the resurrection, as well as their souls, shall live to eternity? Does your lordship believe the eternal life of the one of these, more than of the other, because you think you can prove it of one of them by natural reason, and of the other not. Or can any one, who admits of divine revelation in the case, doubt of one of them more than the other? Or think this proposition less credible, that the bodies of men, after the resurrection, shall live for ever? than this, that the souls of men shall, after the resurrection, live for ever? For that he must do, if he thinks either of them is less credible than the other. If this be so, reason is to be consulted, how far God is to be believed, and the credit of divine testimony must receive its force from the evidence of reason; which is evidently to take away the credibility of divine revelation, in all supernatural truths, wherein the evidence of reason fails. And how much such a principle as this tends to the support of the doctrine of the Trinity, or the promoting the Christian religion, I shall leave it to your lordship to consider.

“ I am not so well read in Hobbes or Spinoza, as to be able to say, what were their opinions in this matter. But possibly there be those, who will think your lordship’s authority of more use to them in the case, than those justly decried names: and be glad to find your lordship a patron of the oracles of reason, so little to the advantage of the oracles of divine revelation. This at least, I think, may be subjoined to the words at the bottom of the next page,^a That those who have gone about to lessen the credibility of the articles of faith, which evidently they do, who say they are less credible, because they cannot be made out demonstratively by natural reason, have not been thought to secure several of the articles of the Christian faith, especially those of the trinity, incarnation, and resurrection of the body, which are those upon the account of which I am brought by your lordship into this dispute.

“ I shall not trouble the reader with your lordship’s endeavours, in the following words, to prove, ‘ That if the soul be not an immaterial substance it can be nothing but life;’ your very first words visibly confuting all that you allege to that purpose. They are,^b ‘ If the soul be a material substance, it is really nothing but life;’ which is to say, that if the soul be really a substance, it is not really a substance, but really nothing else but an affection of a substance; for the life, whether of a material or immaterial substance, is not the substance itself, but an affection of it.

“ 2. You say,^c ‘ Although we think the separate state of the soul after death, is sufficiently revealed in the scripture; yet it creates a great difficulty in understanding it, if the soul be nothing but life, or a material substance, which must be dissolved when life is ended. For if the soul be a material substance, it must be made up, as others are, of the cohesion of solid and separate parts, how minute and invisible soever they be. And what is it which should keep them together, when life is gone? So that it is no easy matter to give an account, how the soul should be capable of immortality, unless it be an immaterial substance; and then we know the solution and texture of bodies cannot reach the soul, being of a different nature.’

“ Let it be as hard a matter as it will to give an account what it is that should keep the parts of a material soul together, after it is separated from the body; yet it will be always as easy to give an account of it, as to give an account what it is that shall keep together a material and immaterial substance. And yet the difficulty that there is to give an account of that, I hope does not, with your lordship, weaken the credibility of the inseparable union of soul and body to eternity: and I persuade myself, that the men of sense, to whom your lordship appeals in the case, do not find their belief of this fundamental point much weakened by that difficulty. I thought heretofore (and by your lordship’s permission, would think so still), that the union of the parts of matter, one with another, is as much in the hands of God, as the union of a material and immaterial substance; and that it does not take off very much, or at all, from the evidence of immortality, which depends on that union, that it is no easy matter to give an account what it is that should keep them together: though its depending wholly upon the gift and good pleasure of God, where the manner creates great difficulty in the understanding, and our reason cannot discover in the nature of things how it is, be that which, your lordship so positively says, lessens the credibility of the fundamental articles of the resurrection and immortality.

“ But, my lord, to remove this objection a little, and to shew of how small force it is even

^a First answer.

^b Ibid.

^c Ibid.

could not order them as well to be produced in a subject we cannot conceive capable of them, as well as in a subject we cannot conceive the motion of matter can any way operate upon? I say not this, that I would any

with yourself; give me leave to presume, that your lordship as firmly believes the immortality of the body after the resurrection, as any other article of faith: if so, then it being no easy matter to give an account, what it is that shall keep together the parts of a material soul, to one that believes it is material, can no more weaken the credibility of its immortality, than the like difficulty weakens the credibility of the immortality of the body. For when your lordship shall find it an easy matter to give an account what it is, besides the good pleasure of God, which shall keep together the parts of our material bodies to eternity, or even soul and body; I doubt not but any one, who shall think the soul material, will also find it as easy to give an account what it is that shall keep those parts of matter also together to eternity.

“Were it not that warmth of controversy is apt to make men so far forget, as to take up those principles themselves (when they will serve their turn) which they have highly condemned in others, I should wonder to find your lordship to argue, that because it is a difficulty to understand what shall keep together the minute parts of a material soul, when life is gone; and because it is not an easy matter to give an account how the soul shall be capable of immortality, unless it be an immaterial substance: therefore it is not so credible as if it were easy to give an account by natural reason, how it could be. For to this it is, that all this your discourse tends, as is evident by what is already set down; and will be more fully made out by what your lordship says in other places, though here needs no such proofs, since it would all be nothing against me in any other sense.

“I thought your lordship had in other places asserted, and insisted on this truth, that no part of divine revelation was the less to be believed because the thing itself created great difficulty in the understanding, and the manner of it was hard to be explained; and it was no easy matter to give an account how it was. This, as I take it, your lordship condemned in others, as a very unreasonable principle, and such as would subvert all the articles of the Christian religion, that were mere matters of faith, as I think it will: and is it possible, that you should make use of it here yourself, against the article of life and immortality, that Christ hath brought to light through the gospel, and neither was, nor could be, made out by natural reason without revelation? But you will say, you speak only of the soul; and your words are, ‘That it is no easy matter to give an account how the soul should be capable of immortality, unless it be an immaterial substance.’ I grant it; but crave leave to say, that there is not any one of those difficulties, that are, or can be, raised about the manner how a material soul can be immortal, which do not as well reach the immortality of the body.

“But, if it were not so, I am sure this principle of your lordship’s would reach other articles of faith, wherein our natural reason finds it not so easy to give an account how those mysteries are; and which therefore, according to your principles, must be less credible than other articles, that create less difficulties to the understanding. For your lordship says,^a ‘That you appeal to any man of sense, whether to a man who thought by his principles, he could from natural grounds demonstrate the immortality of the soul, the finding the uncertainty of those principles he went upon in point of reason,’ i. e. the finding he could not certainly prove it by natural reason, doth not weaken the credibility of that fundamental article, when it is considered purely as a matter of faith. Which in effect, I humbly conceive, amounts to this, that a proposition divinely revealed, that cannot be proved by natural reason, is less credible than one that can: which seems to me to come very little short of this, with due reverence be it spoken, that God is less to be believed when he affirms a proposition that cannot be proved by natural reason, than when he proposes what can be proved by it. The direct contrary to which is my opinion, though you endeavour to make it good by these following words,^b ‘If the evidence of faith falls too much short of that of reason, it must needs have less effect upon men’s minds, when the subserviency of reason is taken away; as it must be when the grounds of certainty by reason are vanished. Is it at all probable, that he who finds his reason deceive him in such fundamental points, should have his faith stand firm and unmoveable on the account of revelation?’ Than which I think there are hardly plainer words to be found out to declare, that the credibility of God’s testimony depends on the natural evidence or probability of the things we receive from revelation; and rises and falls with it: and that the truths of God, or the articles of mere faith, lose so much of their credibility, as they want proof from reason: which, if true, revelation may come to have no credibility at all. For if, in this present case, the credibility of this proposition, ‘the souls of men shall live for ever,’ revealed in the Scripture, be lessened by confessing it cannot be demonstratively proved from reason; though it be asserted to be most highly probable; must not, by the same rule, its credibility dwindle

^a Second answer.

^b Ibid.

way lessen the belief of the soul's immateriality : I am not here speaking of probability, but knowledge ; and I think not only, that it becomes the modesty of philosophy not to pronounce magisterially, where

away to nothing, if natural reason should not be able to make it out to be so much as probable ; or should place the probability from natural principles on the other side ? For if mere want of demonstration lessens the credibility of any proposition divinely revealed, must not want of probability, or contrary probability from natural reason, quite take away its credibility ? Here at last it must end, if in any one case the veracity of God, and the credibility of the truths we receive from him by revelation, be subjected to the verdicts of human reason, and be allowed to receive any accession or diminution from other proofs, or want of other proofs of its certainty or probability.

“ If this be your lordship's way to promote religion, or defend its articles, I know not what argument the greatest enemies of it could use more effectual for the subversion of those you have undertaken to defend ; this being to resolve all revelation perfectly and purely into natural reason, to bound its credibility by that, and leave no room for faith in other things, than what can be accounted for by natural reason without revelation.

“ Your lordship^a insists much upon it, as if I had contradicted what I had said in my Essay,^b by saying, ‘ That upon my principles it cannot be demonstratively proved, that it is an immaterial substance in us that thinks, however probable it be.’ He that will be at the pains to read that chapter of mine, and consider it, will find, that my business there was to shew, that it was no harder to conceive an immaterial than a material substance ; and that from the ideas of thought, and a power of moving of matter, which we experienced in ourselves (ideas originally not belonging to matter as matter), there was no more difficulty to conclude there was an immaterial substance in us, than that we had material parts. These ideas of thinking, and power of moving of matter, I, in another place, shewed, did, demonstratively lead us to the certain knowledge of the existence of an immaterial thinking being, in whom we have the idea of spirit in the strictest sense ; in which sense I also applied it to the soul, in that 23d chap. of my Essay ; the easily conceivable possibility, nay, great probability, that the thinking substance in us is immaterial, giving me sufficient ground for it. In which sense I shall think I may safely attribute it to the thinking substance in us, till your lordship shall have better proved from my words, that it is impossible it should be immaterial. For I only say, that it is possible, i. e. involves no contradiction, that God, the omnipotent immaterial Spirit, should, if he pleases, give to some parcels of matter, disposed as he thinks fit, a power of thinking and moving ? which parcels of matter so endued with a power of thinking and motion, might properly be called spirits, in contradistinction to unthinking matter, in all which, I presume, there is no manner of contradiction.

“ I justified my use of the word spirit, in that sense, from the authorities of Cicero and Virgil, applying the Latin word *spiritus*, from whence spirit is derived to the soul as a thinking thing, without excluding materiality out of it. To which your lordship replies,^c ‘ That Cicero, in his Tusculan Questions, supposes the soul not to be a finer sort of body, but of a different nature from the body—that he calls the body, the prison of the soul—and says, That a wise man's business is to draw off his soul from his body.’ And then your lordship concludes, as is usual, with a question, ‘ Is it possible now to think so great a man looked on the soul but as a modification of the body, which must be at an end with life ? Answer, No ; it is impossible that a man of so good sense as Tully, when he uses the word *corpus*, or body, for the gross and visible parts of a man, which he acknowledges to be mortal, should look on the soul to be a modification of that body ; in a discourse wherein he was endeavouring to persuade another, that it was immortal. It is to be acknowledged, that truly great men, such as he was, are not wont so manifestly to contradict themselves. He had therefore no thought concerning the modification of the body of a man in the case. He was not such a trifler as to examine, whether the modification of the body of a man was immortal, when that body itself was mortal. And therefore that which he reports as Dicaearchus's opinion, he dismisses in the beginning without any more ado, c. 11. But Cicero's was a direct, plain, and sensible inquiry, viz. What the soul was ; to see whether from thence he could discover its immortality. But in all that discourse in his first book of Tusculan Questions, where he lays out so much of his reading and reason, there is not one syllable shewing the least thought that the soul was an immaterial substance, but many things directly to the contrary.

Indeed (1.) he shuts out the body, taken in the sense he uses^d *corpus* all along, for the sensible organical parts of a man ; and is positive that is not the soul : and body in this sense, taken for the human body, he calls the prison of the soul : and says a wise man, instancing in Socrates and Cato, is glad of a fair opportunity to get out of it. But he no where says

^a First answer.

^b B. 2. c. 23.

^c First answer.

^d C. 19. 22. 30, 31, &c.

we want that evidence that can produce knowledge ; but also, that it is of use to us, to discern how far our knowledge does reach : for the state we are at present in, not being that of vision, we must, in many any such thing of matter ; he calls not matter in general the prison of the soul, nor talks a word of being separate from it.

“ 2. He concludes, that the soul is not, like other things here below, made up of a composition of the elements, c. 27.

“ He excludes the two gross elements, earth and water, from being the soul, c. 26.

“ So far he is clear and positive : but beyond this, he is uncertain ; beyond this, he could not get. For in some places, he speaks doubtfully, whether the soul be not air or fire, *Anima sit animus, ignisvæ, nescio*, c. 25. And therefore he agrees with Panætius, that if it be at all elementary, it is, as he calls it, *inflammata anima*, inflamed air ; and for this he gives several reasons, c. 18, 19. And though he thinks it to be of a peculiar nature of its own, yet he is so far from thinking it immaterial, that he says, c. 19. that the admitting it to be of an aerial or igneous nature, will not be inconsistent with any thing he had said.

“ That which he seems most to incline to, is, that the soul was not at all elementary, but was of the same substance with the heavens ; which Aristotle, to distinguish from the four elements, and the changeable bodies here below, which he supposed made up of them, called *quinta essentia*. That this was Tully’s opinion, is plain, from these words : *Ergo animus (qui, ut ego dico, divinus) est, ut Euripides audent dicere, Deus : et quidem, si Deus aut anima aut ignis est, idem est animus hominis. Nam ut illa natura celestis et terrâ vacat et humore ; sic utriusque harum rerum humanus animus est expers. Sin autem est quinta quedam natura ab Aristotele inducta ; primum hæc et deorum est et animorum. Hanc nos sententiam secuti, his ipsis verbis in consolatione hæc expressimus*, c. 29. And then he goes on, c. 27, to repeat those, his own, words, which your lordship has quoted out of him, wherein he had affirmed, in his treatise *De Consolatione*, the soul not to have its original from the earth, or to be mixed or made of any thing earthly ; but had said, *Singularis est igitur quedam natura et vis animi, sejuncta ab his usitatis notisque naturis* : whereby he tells us, he meant nothing but Aristotle’s *quinta essentia* ; which being unmix’d, being that of which the gods and souls consisted, he calls it *divinum cæleste*, and concludes it eternal, it being, as he speaks, *sejuncta ab omni mortali concretionem*. From which it is clear, that in all his inquiry about the substance of the soul, his thoughts went not beyond the four elements, or Aristotle’s *quinta essentia*, to look for it. In all which, there is nothing of immateriality, but quite the contrary.

“ He was willing to believe (as good and wise men have always been), that the soul was immortal ; but for that it is plain he never thought of its immateriality, but as the eastern people do, who believe the soul to be immortal, but have nevertheless no thought, no conception, of its immateriality. It is remarkable what a very considerable and judicious author says^a in the case. ‘ No opinion,’ says he, ‘ has been so universally received, as that of the immortality of the soul ; but its immateriality is a truth, the knowledge whereof has not spread so far. And indeed it is extremely difficult to let into the mind of a Siamite, the idea of a pure spirit. This the missionaries, who have been longest among them, are positive in. All the Pagans of the East do truly believe, that there remains something of a man after his death, which subsists independently and separately from his body. But they give extension and figure to that which remains, and attribute to it all the same members, all the same substances, both solid and liquid, which our bodies are composed of. They only suppose that the souls are of a matter subtile enough to escape being seen or handled.’ Such were the shades and the manes of the Greeks and the Romans. And it is by these figures of the souls, answerable to those of the bodies, that Virgil supposed Æneas knew Palinurus, Dido, and Anchises, in the other world.

“ This gentleman was not a man that travelled into those parts for his pleasure, and to have the opportunity to tell strange stories, collected by chance, when he returned ; but one chosen for the purpose (and he seems well chosen for the purpose), to inquire into the singularities of Siam. And he has so well acquitted himself of the commission which his Epistle Dedicatory tells us he had, to inform himself exactly of what was most remarkable there, that had we but such an account of other countries of the East, as he has given us of this kingdom, which he was an envoy to, we should be much better acquainted than we are, with the manners, notions, and religions of that part of the world, inhabited by civilized nations, who want neither good sense nor acuteness of reason, though not cast into the mould of the logic and philosophy of our schools.

“ But, to return to Cicero, it is plain, that in his inquiries about the soul, his thoughts went not at all beyond matter. Thus the expressions that drop from him in several places of this book, evidently shew. For example, ‘ That the souls of excellent men and women ascended into heaven ; of others, that they remained here on earth,’ c. 12. ‘ That the soul is hot, and warms the body ; that at its leaving the body, it penetrates and divides, and

^a Louberc du Royaume de Siam, t. l. c. 19. §. 4.

things content ourselves with faith and probability: and in the present question about the immateriality of the soul, if our faculties cannot arrive at demonstrative certainty, we need not think it strange. All

breaks through our thick, cloudy, moist air; that it stops in the region of fire, and ascends no farther, the equality of warmth and weight making that its proper place, where it is nourished and sustained with the same thing wherewith the stars are nourished and sustained, and that by the convenience of its neighbourhood it shall there have a clearer view and fuller knowledge of the heavenly bodies,' c. 19. 'That the soul also, from this height, shall have a pleasant and fairer prospect of the globe of the earth, the disposition of whose parts will then lie before it in one view,' c. 20. 'That it is hard to determine what conformation, size, and place, the soul has in the body; that it is too subtle to be seen; that it is in the human body, as in a house, or a vessel, or a receptacle,' c. 22. All which are expressions that sufficiently evidence, that he who used them, had not in his mind separated materiality from the idea of the soul.

"It may perhaps be replied, that a great part of this which we find in c. 19. is said upon the principles of those who would have the soul to be *anima inflammata*, inflamed air. I grant it. But it is also to be observed, that in this 19th and the two following chapters, he does not only not deny, but even admits, that so material a thing as inflamed air may think.

"The truth of the case, in short, is this; Cicero was willing to believe the soul immortal; but when he sought in the nature of the soul itself, something to establish this his belief into a certainty of it, he found himself at a loss. He confessed he knew not what the soul was; but the not knowing what it was, he argues, c. 22. was no reason to conclude it was not. And thereupon he proceeds to the repetition of what he had said in his 6th book, *de Republica* concerning the soul. The argument, which, borrowed from Plato, he there makes use of, if it have any force in it, not only proves the soul to be immortal, but more than, I think, your lordship will allow to be true; for it proves it to be eternal, and without beginning, as well as without end: *Negue nata certe est, et aeterna est*, says he.

"Indeed, from the faculties of the soul, he concludes right, 'That it is of divine original.' But as to the substance of the soul, he at the end of this discourse concerning its faculties, c. 25. as well as at this beginning of it, c. 22. is not ashamed to own his ignorance of what it is: *Anima sit animus, ignisve, nescio; nec me pudet, ut istos, fateri nescire quod nesciam. Illud si ulla alia de re obscura affirmare possem, sive anima, sive ignis sit animus, eum jurarem esse divinum*, c. 25. So that all the certainty he could attain to about the soul, was, that he was confident there was something divine in it, i. e. there were faculties in the soul that could not result from the nature of matter, but must have their original from a divine power; but yet those qualities, as divine as they were, he acknowledged might be placed in breath or fire, which your lordship will not deny to be material substances. So that all those divine qualities, which he so much and justly extols in the soul, led him not, as appears, so much as to any the least thought of immateriality. This is demonstration, that he built them not upon an exclusion of materiality out of the soul; for he avowedly professes he does not know, but breath or fire might be this thinking thing in us: and in all his considerations about the substance of the soul itself, he stuck in air or fire, or Aristotle's *quinta essentia*: for beyond those, it is evident he went not.

"But with all his proofs out of Plato, to whose authority he defers so much, with all the arguments his vast reading and great parts could furnish him with for the immortality of the soul, he was so little satisfied, so far from being certain, so far from any thought that he had or could prove it, that he over and over again professes his ignorance and doubt of it. In the beginning, he enumerates the several opinions of the philosophers, which he had well studied, about it. And then, full of uncertainty, says, *Harum sententiarum quæ vera sit, Deus aliquis viderit; quæ verisimillima magna quæstio*, c. 11. And towards the latter end, having gone them all over again, and one after another examined them, he professes himself still at a loss, not knowing on which to pitch, nor what to determine. *Mentis acies*, says he, *seipsam intuens, nonnunquam habescit, ob eamque causam contemplandi diligentiam amittimus. Itaque dubitans, circumspectans, hæsitans, multa adversa revertens, tanquam in rate in mari immenso, nostra vehitur oratio*, c. 30. And to conclude this argument, when the person he introduces as discoursing with him, tells him he is resolved to keep firm to the belief of immortality, Tully answers, c. 32. *Laudo id quidem, et si nihil animis oportet considerare: movemur enim sæpe aliquo acute concluso; labamus, mutamusque sententiam clarioribus etiam in rebus; in his est enim aliqua obscuritas*.

"So unmoveable is that truth delivered by the spirit of truth, that though the light of nature gave some obscure glimmering, some uncertain hopes, of a future state; yet human reason could attain to no clearness, no certainty, about it, but that it was JESUS CHRIST alone who had brought life and immortality to light, through the gospel.^a Though we are now told, that to own the inability of natural reason, to bring immortality to light, or which

^a 2 Tim. i. 10.

the great ends of morality and religion are well enough secured, without philosophical proofs of the soul's immateriality; since it is evident, that he who made us at the beginning to subsist here, sensible, intel-

passes for the same, to his own principles upon which the immateriality of the soul (and as it is urged consequently, its immortality,) cannot be demonstratively proved, does lessen the belief of this article of revelation, which JESUS CHRIST alone has brought to light, and which consequently the Scripture assures us is established and made certain only by revelation. This would not perhaps have seemed strange from those who are justly complained of, for slighting the revelation of the Gospel, and therefore would not be much regarded, if they should contradict so plain a text of Scripture, in favour of their all-sufficient reason. But what use the promoters of scepticism and infidelity, in an age so much suspected by your lordship, may make of what comes from one of your great authority and learning, may deserve your consideration.

"And thus, my lord, I hope I have satisfied you concerning Cicero's opinion about the soul, in his first book of Tusculan Questions; which, though I easily believe, as your lordship says, you are no stranger to, yet I humbly conceive you have not shewn (and upon a careful perusal of that treatise again, I think I may boldly say you cannot shew) one word in it, that expresses any thing like a notion in Tully of the soul's immateriality, or its being an immaterial substance.

"From what you bring out of Virgil, your lordship^a concludes, 'That he, no more than Cicero, does me any kindness in this matter, being both asserters of the soul's immortality.' My lord, were not the question of the soul's immateriality, according to custom, changed here into that of its immortality, which I am no less an asserter of than either of them, Cicero and Virgil do me all the kindness I desired of them in this matter; and that was, to shew that they attributed the word *spiritus* to the soul of man, without any thought of its immateriality; and this the verses you yourself bring out of Virgil,^b

'Et cum frigida mors anima seduxerit artus,
Omnibus umbra locis adero, dabis, improbe, pœnas;'

confirm, as well as those I quoted out of his 6th book; and for this, M. de la Loubere shall be my witness, in the words above set down out of him; where he shews, there be those amongst the heathens of our days, as well as Virgil and others amongst the ancient Greeks and Romans, who thought the souls or ghosts of men departed, did not die with the body, without thinking them to be perfectly immaterial; the latter being much more incomprehensible to them than the former. And what Virgil's notion of the soul is, and that *corpus*, when put in contradistinction to the soul, signifies nothing but the gross tenement of flesh and bones, is evident from this verse of his *Æneid* 6, where he calls the souls which yet were visible,

—————'Tenuis sine corpore vitas.'

"Your lordship's^c answer concerning what is said, Eccles. iii. turns wholly upon Solomon's taking the soul to be immortal, which was not what I question; all that I quoted that place for, was to shew, that spirit in English might properly be applied to the soul, without any notion of its immateriality, as *רוח* was by Solomon, which, whether he thought the souls of men to be immaterial, does little appear in that passage where he speaks of the souls of men and beasts together, as he does. But farther, what I contended for is evident from that place, in that the word spirit is there applied by our translators, to the souls of beasts, which your lordship, I think, does not rank amongst the immaterial, and consequently immortal, spirits, though they have sense and spontaneous motion.

"But you say,^d 'If the soul be not of itself a free thinking substance you do not see what foundation there is in nature for a day of judgment.' Ans. Though the heathen world did not of old, nor do to this day, see a foundation in nature for a day of judgment; yet in revelation, if that will satisfy your lordship, every one may see a foundation for a day of judgment, because God has positively declared it; though God has not, by that revelation, taught us what the substance of the soul is; nor has any where said, that the soul of itself is a free agent. Whatsoever any created substance is, it is not of itself, but is by the good pleasure of its Creator: whatever degrees of perfection it has, it has from the bountiful hand of its Maker. For it is true in a natural, as well as a spiritual, sense, what St. Paul says,^e 'Not that we are sufficient of ourselves to think any thing as of ourselves, but our sufficiency is of God.'

"But your lordship, as I guess by your following words, would argue, that a material substance cannot be a free agent; whereby I suppose you only mean, that you cannot see or conceive how a solid substance should begin, stop, or change its own motion. To which, give me leave to answer, that when you can make it conceivable, how any created,

^e 2 Cor. iii. 5.

ligent beings, and for several years, continued us in such a state, can, and will restore us to the like state of sensibility in another world, and make us capable there to receive the retribution he has designed to men, according to their doings in this life. And therefore it is not of such mighty necessity to determine one way or the other, as some over zealous for or against the immateriality of the soul, have been forward to make the world believe. Who, either on the one side, indulging too much their thoughts, immersed altogether in matter, can allow no existence to what is not material: or who, on the other side, finding not cogitation within the natural powers of matter, examined over and over again by the utmost intention of mind, have the confidence to conclude, that omnipotency itself cannot give perception and thought to a substance which has the modification of solidity. He that considers how hardly sensation is, in our thoughts, reconcilable to extended matter; or existence to any thing that hath no extension at all, will confess, that he is very far from certainly knowing what his soul is. It is a point, which seems to me to be put out of the reach of our knowledge: and he who will give himself leave to consider freely, and look into the dark

finite, dependant substance can move itself, or alter or stop its own motion, which it must to be a free agent; I suppose you will find it no harder for God to bestow this power on a solid, than an unsolid, created substance. Tully, in the place above-quoted,^a could not conceive this power to be in any thing but what was from eternity; *Cum pateat igitur æternum id esse quod seipsum moveat quis est qui hanc naturam animis esse tributam neget?* But though you cannot see how any created substance, solid or not solid, can be a free agent (pardon me, my lord, if I put in both, till your lordship please to explain it of either, and shew the manner how either of them can, of itself, move itself or any thing else), yet I do not think you will so far deny men to be free agents, from the difficulty there is to see how they are free agents, as to doubt whether there be foundation enough for a day of judgment.

“It is not for me to judge how far your lordship’s speculations reached; but finding in myself nothing to be truer than what the wise Solomon tells me,^b ‘As thou knowest not what is the way of the spirit, nor how the bones do grow in the womb of her that is with child; even so thou knowest not the works of God, who maketh all things;’ I gratefully receive and rejoice in the light of revelation, which sets me at rest in many things, the manner whereof my poor reason can by no means make out to me: Omnipotency, I know, can do any thing that contains in it no contradiction: so that I readily believe whatever God has declared, though my reason find difficulties in it which it cannot master. As in the present case, God having revealed that there shall be a day of judgment, I think that foundation enough to conclude men are free enough to be made answerable for their actions, and to receive according to what they have done; though how man is a free agent, surpasses my explication or comprehension.

“In answer to the place I brought out of St. Luke,^c your lordship asks,^d ‘Whether from these words of our Saviour it follows, that a spirit is only the appearance?’ I answer, No; nor do I know who drew such an inference from them: but it follows that in apparitions there is something that appears, and that which appears is not wholly immaterial; and yet this was properly called πνεῦμα, and was often looked upon, by those who called it πνεῦμα in Greek, and now call it spirit in English, to be the ghost or soul of one departed; which, I humbly conceive, justifies my use of the word spirit, for a thinking voluntary agent, whether material or immaterial.

“Your lordship says,^e ‘That I grant, that it cannot upon these principles be demonstrated, that the spiritual substance in us is immaterial:’ from whence you conclude, ‘That then my grounds of certainty from ideas are plainly given up.’ This being a way of arguing that you often make use of, I have often had occasion to consider it, and cannot after all see the force of this argument. I acknowledge that this or that proposition cannot upon my principles be demonstrated; ergo, I grant this proposition to be false, that certainty consists in the perception of the agreement or disagreement of ideas. For that is my ground of certainty, and till that be given up, my grounds of certainty are not given up.

^b Eccles. xi. 5.

^c Ch. xxiv. 32.

^d First answer.

^e Ibid.

and intricate part of each hypothesis, will scarce find his reason able to determine him fixedly for or against the soul's materiality. Since on which side soever he views it, either as an unextended substance, or as a thinking extended matter; the difficulty to conceive either, will, whilst either alone is in his thoughts, still drive him to the contrary side. An unfair way which some men take with themselves: who, because of the inconceivableness of something they find in one, throw themselves violently into the contrary hypothesis, though altogether as unintelligible to an unbiassed understanding. This serves not only to shew the weakness and scantiness of our knowledge, but the insignificant triumph of such sort of arguments, which drawn from our own views, may satisfy us that we can find no certainty on one side of the question; but do not at all thereby help us to truth, by running into the opposite opinion, which, on examination, will be found clogged with equal difficulties. For what safety, what advantage, to any one is it, for the avoiding the seeming absurdities, and, to him, insurmountable rubs he meets with in one opinion, to take refuge in the contrary, which is built on something altogether as inexplicable, and as far remote from his comprehension? It is past controversy, that we have in us something that thinks; our very doubts about what it is, confirm the certainty of its being, though we must content ourselves in the ignorance of what kind of being it is: and it is in vain to go about to be sceptical in this, as it is unreasonable in most other cases to be positive against the being of any thing, because we cannot comprehend its nature. For I would fain know what substance exists that has not something in it, which manifestly baffles our understandings. Other spirits, who see and know the nature and inward constitution of things, how much must they exceed us in knowledge? To which if we add larger comprehension, which enables them at one glance to see the connexion and agreement of very many ideas, and readily supplies to them the intermediate proofs, which we by single and slow steps, and long poring in the dark, hardly at last find out, and are often ready to forget one, before we have hunted out another: we may guess at some part of the happiness of superior ranks of spirits, who have a quicker and more penetrating sight, as well as a larger field of knowledge. But to return to the argument in hand, our knowledge, I say, is not only limited to the paucity and imperfections of the ideas we have, and which we employ it about, but even comes short of that too: but how far it reaches, let us now inquire.

§ 7. *How far our knowledge reaches.*—The affirmations or negations we make concerning the ideas we have, may, as I have before intimated in general, be reduced to these four sorts, viz. identity, co-existence, relation, and real existence. I shall examine how far our knowledge extends in each of these.

§ 8. *First, our knowledge of identity and diversity, as far as our ideas.*—*First,* As to identity and diversity, in this way of agreement or disagreement of our ideas, our intuitive knowledge is as far extended as our ideas themselves; and there can be no idea in the mind, which it does not presently, by an intuitive knowledge, perceive to be what it is, and to be different from any other.

§ 9. *Secondly, of co-existence a very little way.*—*Secondly,* As to the second sort, which is the agreement or disagreement of our ideas in co-existence; in this our knowledge is very short, though in this consists the greatest and most material part of our knowledge concerning substances. For our ideas of the species of substances being, as I have shewn, nothing but certain collections of simple ideas united in one subject, and so co-existing together: v. g. our idea of flame is a body hot, luminous, and moving upward; of gold, a body heavy to a certain degree, yellow, malleable, and fusible. These, or some such complex ideas as these in men's minds, do these two names of the different substances, flame and gold, stand for. When we would know any thing farther concerning these, or any other sort of substances, what do we inquire, but what other qualities, or power, these substances have, or have not? Which is nothing else but to know, what other simple ideas do, or do not, co-exist with those that make up that complex idea?

§ 10. *Because the connexion between most simple ideas is unknown.*—This, how weighty and considerable a part soever of human science, is yet very narrow, and scarce any at all. The reason whereof is, that the simple ideas, whereof our complex ideas of substances are made up, are, for the most part, such as carry with them, in their own nature, no visible necessary connexion, or inconsistency, with any other simple ideas, whose co-existence with them we would inform ourselves about.

§ 11. *Especially of secondary qualities.*—The ideas that our complex ones of substances are made up of, and about which our knowledge, concerning substances, is most employed, are those of their secondary qualities; which depending all (as has been shewn) upon the primary qualities of their minute and insensible parts; or if not upon them, upon something yet more remote from our comprehension, it is impossible we should know which have a necessary union or inconsistency one with another: for not knowing the root they spring from, not knowing what size, figure, and texture of parts they are, on which depend, and from which result, those qualities which make our complex idea of gold, it is impossible we should know what other qualities result from, or are incompatible with, the same constitution of the insensible parts of gold; and so consequently must-always co-exist with that complex idea we have of it, or else are inconsistent with it.

§ 12. *Because all connexion between any secondary and primary qualities, is undiscoverable.*—Besides this ignorance of the primary qualities of the insensible parts of bodies, on which depend all their secondary qualities, there is yet another and more incurable part of ignorance, which sets us more remote from a certain knowledge of the co-existence or inco-existence (if I may so say) of different ideas in the same subject; and that is, that there is no discoverable connexion between any secondary quality, and those primary qualities which it depends on.

§ 13. That the size, figure, and motion of one body, should cause a change in the size, figure, and motion of another body, is not beyond

our conception: the separation of the parts of one body, upon the intrusion of another; and the change from rest to motion, upon impulse; these, and the like, seem to us to have some connexion one with another. And if we knew these primary qualities of bodies, we might have reason to hope, we might be able to know a great deal more of these operations of them one with another; but our minds not being able to discover any connexion between these primary qualities of bodies, and the sensations that are produced in us by them, we can never be able to establish certain and undoubted rules of the consequences or co-existence of any secondary qualities, though we could discover the size, figure, or motion of those invisible parts which immediately produce them. We are so far from knowing what figure, size, or motion of parts produce a yellow colour, a sweet taste, or a sharp sound, that we can by no means conceive how any size, figure, or motion of any particles, can possibly produce in us the idea of any colour, taste, or sound whatsoever; there is no conceivable connexion between the one and the other.

§ 14. In vain, therefore, shall we endeavour to discover by our ideas (the only true way of certain and universal knowledge), what other ideas are to be found constantly joined with that of our complex idea of any substance; since we neither know the real constitution of the minute parts on which their qualities do depend; nor, did we know them, could we discover any necessary connexion between them, and any of the secondary qualities; which is necessary to be done, before we can certainly know their necessary co-existence. So that, let our complex idea of any species of substances be what it will, we can hardly, from the simple ideas contained in it, certainly determine the necessary co-existence of any other quality whatsoever. Our knowledge in all these inquiries, reaches very little farther than our experience. Indeed, some few of the primary qualities have a necessary dependence, and visible connexion, one with another, as figure necessarily supposes extension; receiving or communicating motion by impulse, supposes solidity. But though these, and perhaps some other of our ideas, have, yet there are so few of them, that have a visible connexion one with another, that we can by intuition or demonstration discover the co-existence of very few of the qualities that are to be found united in substances: and we are left only to the assistance of our senses, to make known to us what qualities they contain. For of all the qualities that are co-existent in any subject, without this dependence and evident connexion of their ideas one with another, we cannot know certainly any two to co-exist any farther, than experience, by our senses, informs us. Thus, though we see the yellow colour, and upon trial find the weight, malleableness, fusibility, and fixedness, that are united in a piece of gold; yet because no one of these ideas has any evident dependence, or necessary connexion with the other, we cannot certainly know, that where any four of these are, the fifth will be there also, how highly probable soever it may be; because the highest probability amounts not to certainty; without which there can be no true knowledge. For this co-existence can be no farther known, than it is perceived; and it cannot be perceived but either in particular

subjects, by the observation of our senses, or in general, by the necessary connexion of the ideas themselves.

§ 15. *Of repugnancy to co-exist larger.*—As to the incompatibility or repugnancy to co-existence, we may know, that any subject may have of each sort of primary qualities but one particular at once, v. g. each particular extension, figure, number of parts, motion, excludes all other of each kind. The like also is certain of all sensible ideas peculiar to each sense; for whatever of each kind is present in any subject, excludes all other of that sort; v. g. no one subject can have two smells, or two colours, at the same time. To this, perhaps, will be said, Has not an *opal*, or the infusion of *lignum nephriticum*, two colours at the same time? To which I answer, that these bodies, to eyes differently placed, may at the same time afford different colours; but I take liberty also to say, that to eyes differently placed, it is different parts of the object that reflect the particles of light; and therefore it is not the same part of the object, and so not the very same subject, which at the same time appears both yellow and azure. For it is as impossible that the very same particle of any body should, at the same time, differently modify or reflect the rays of light, as that it should have two different figures and textures at the same time.

§ 16. *Of the co-existence of powers a very little way.*—But as to the powers of substances to change the sensible qualities of other bodies, which make a great part of our inquiries about them, and is no considerable branch of our knowledge; I doubt, as to these, whether our knowledge reaches much farther than our experience; or whether we can come to the discovery of most of these powers, and be certain that they are in any subject, by the connexion with any of those ideas which to us make its essence. Because the active and passive powers of bodies, and their ways of operating, consisting in a texture and motion of parts, which we cannot by any means come to discover: it is but in very few cases we can be able to perceive their dependence on, or repugnance to, any of those ideas, which make our complex one of that sort of things. I have here instanced in the corpuscularian hypothesis, as that which is thought to go farthest in an intelligible explication of those qualities of bodies; and I fear the weakness of human understanding is scarce able to substitute another, which will afford us a fuller and clearer discovery of the necessary connexion and co-existence of the powers which are to be observed united in several sorts of them. This at least is certain, that whichever hypothesis be clearest and truest (for of that it is not my business to determine), our knowledge concerning corporeal substances, will be very little advanced by any of them, till we are made to see what qualities and powers of bodies have a necessary connexion or repugnancy one with another; which in the present state of philosophy, I think, we know but to a very small degree: and I doubt whether with those faculties we have, we shall ever be able to carry our general knowledge (I say not particular experience) in this part much farther. Experience is that which in this part we must depend on. And it were to be wished, that it were more improved. We find the advantages some men's generous

pains have this way brought to the stock of natural knowledge. And if others, especially the philosophers by fire, who pretend to it, had been so wary in their observations, and sincere in their reports, as those who call themselves philosophers ought to have been; our acquaintance with the bodies here about us, and our insight into their powers and operations, had been yet much greater.

§ 17. *Of spirits yet narrower.*—If we are at a loss in respect of the powers and operations of bodies, I think it is easy to conclude, we are much more in the dark in reference to the spirits; whereof we naturally have no ideas, but what we draw from that of our own, by reflecting on the operations of our own souls within us, as far as they can come within our observation. But how inconsiderable a rank the spirits that inhabit our bodies, hold amongst those various, and possibly innumerable, kinds of nobler beings; and how far short they come of the endowments and perfections of cherubims and seraphims, and infinite sorts of spirits above us; is what by a transient hint, in another place, I have offered to my reader's consideration.

§ 18. *Thirdly, of other relations it is not easy to say how far.*—As to the third sort of our knowledge, viz. the agreement or disagreement of any of our ideas in any other relation: this, as it is the largest field of our knowledge, so it is hard to determine how far it may extend; because the advances that are made in this part of knowledge, depending on our sagacity in finding intermediate ideas, that may shew the relations and habitudes of ideas, whose co-existence is not considered, it is a hard matter to tell when we are at an end of such discoveries; and when reason has all the helps it is capable of, for the finding of proofs, or examining the agreement or disagreement of remote ideas. They that are ignorant of algebra, cannot imagine the wonders in this kind are to be done by it; and what farther improvements and helps, advantageous to other parts of knowledge, the sagacious mind of man may yet find out, it is not easy to determine. This, at least, I believe, that the ideas of quantity are not those alone that are capable of demonstration and knowledge; and that other, and perhaps more useful, parts of contemplation, would afford us certainty, if vices, passions, and domineering interest, did not oppose or menace such endeavours.

Morality capable of demonstration.—The idea of a Supreme Being, infinite in power, goodness, and wisdom, whose workmanship we are, and on whom we depend; and the idea of ourselves, as understanding rational beings, being such as are clear in us, would, I suppose, if duly considered and pursued, afford such foundations of our duty and rules of action, as might place morality amongst the sciences capable of demonstration; wherein I doubt not, but from self-evident propositions, by necessary consequences, as incontestable as those in mathematics, the measures of right and wrong might be made out, to any one that will apply himself with the same indifferency and attention to the one, as he does to the other of these sciences. The relation of other modes may certainly be perceived, as well as those of number and extension; and I cannot see why they should not also be capable of demonstration, if due methods were thought on to examine, or pur-

sue, their agreement or disagreement. Where there is no property, there is no injustice, is a proposition as certain as any demonstration in Euclid : for the idea of property, being a right to any thing, and the idea to which the name injustice is given, being the invasion or violation of that right ; it is evident, that these ideas being thus established, and these names annexed to them, I can as certainly know this proposition to be true, as that a triangle has three angles equal to two right ones. Again, “ no government allows absolute liberty ;” the idea of government being the establishment of society upon certain rules or laws, which require conformity to them ; and the idea of absolute liberty being for any one to do whatever he pleases ; I am as capable of being certain of the truth of this proposition, as of any in the mathematics.

§ 19. *Two things have made moral ideas thought incapable of demonstration ; their complexedness, and want of sensible representations.*—That which in this respect has given the advantage to the ideas of quantity, and made them thought more capable of certainty and demonstration, is,

First. That they can be set down and represented by sensible marks, which have a greater and nearer correspondence with them, than any words or sounds whatsoever. Diagrams drawn on paper, are copies of the ideas in the mind, and not liable to the uncertainty that words carry in their signification. An angle, circle, or square, drawn in lines, lies open to the view, and cannot be mistaken ; it remains unchangeable, and may, at leisure, be considered and examined, and the demonstration be revised, and all the parts of it may be gone over more than once, without any danger of the least change in the ideas. This cannot be thus done in moral ideas ; we have no sensible marks that resemble them, whereby we can set them down ; we have nothing but words to express them by ; which though, when written, they remain the same, yet the ideas they stand for, may change in the same man ; and it is very seldom that they are not different in different persons.

Secondly, Another thing that makes the greater difficulty in ethics, is, that moral ideas are commonly more complex than those of the figures ordinarily considered in mathematics. From whence these two inconveniences follow. 1. That their names are of more uncertain signification, the precise collection of simple ideas they stand for not being so easily agreed on, and so the sign that is used for them in communication always, and in thinking often, does not steadily carry with it the same idea. Upon which the same disorder, confusion, and error follow, as would, if a man going to demonstrate something of an heptagon, should in the diagram he took to do it, leave out one of the angles, or, by oversight, make the figure with one angle more than the name ordinarily imported, or he intended it should, when at first he thought of his demonstration. This often happens, and is hardly avoidable in very complex moral ideas, where the same name being retained, one angle, i. e. one simple idea, is left out of, or put in, the complex one (still called by the same name), more at one time than another. 2. From the complexedness of these moral ideas, there follows an

other inconvenience, viz. that the mind cannot easily retain those precise combinations so exactly and perfectly as is necessary in the examination of the habitudes and correspondencies, agreements or disagreements, of several of them, one with another; especially where it is to be judged of by long deductions, and the intervention of several other complex ideas, to shew the agreement or disagreement of two remote ones.

The great help against this, which mathematicians find in diagrams and figures, which remain unalterable in their draughts, is very apparent; and the memory would often have great difficulty otherwise to retain them so exactly, whilst the mind went over the parts of them, step by step, to examine their several correspondences; and though, in casting up a long sum, either in addition, multiplication, or division, every part be only a progression of the mind, taking a view of its own ideas, and considering their agreement or disagreement; and the resolution of the question be nothing but the result of the whole, made up of such particulars, whereof the mind has a clear perception; yet without setting down the several parts by marks, whose precise significations are known, and by marks that last and remain in view when the memory had let them go, it would be almost impossible to carry so many different ideas in the mind, without confounding or letting slip, some parts of the reckoning, and thereby make all our reasonings about it useless. In which case, the ciphers, or marks, help not the mind at all to perceive the agreement of any two or more numbers, their equalities or proportions; that the mind has only by intuition of its own ideas of the numbers themselves. But the numerical characters are helps to the memory, to record and retain the several ideas about which the demonstration is made, whereby a man may know how far his intuitive knowledge, in surveying several of the particulars, has proceeded; that so he may, without confusion, go on to what is yet unknown, and at last have in one view before him the result of all his perceptions and reasonings.

§ 20. *Remedies of those difficulties.*—One part of these disadvantages in moral ideas, which has made them be thought not capable of demonstration, may in a good measure be remedied by definitions, setting down that collection of simple ideas which every term shall stand for, and then using the terms steadily and constantly for that precise collection. And what methods algebra, or something of that kind, may hereafter suggest, to remove the other difficulties, it is not easy to foretell. Confident I am, that if men would, in the same method, and with the same indifferency, search after moral, as they do mathematical, truths, they would find them have a stronger connexion one with another, and a more necessary consequence from our clear and distinct ideas, and to come nearer perfect demonstration, than is commonly imagined. But much of this is not to be expected, whilst the desire of esteem, riches, or power, makes men espouse the well-endowed opinions in fashion, and then seek arguments, either to make good their beauty, or varnish over and cover their deformity: nothing being so beautiful to the eye, as truth is to the mind; nothing so deformed and irreconcilable to the understanding as a lie. For though many a man

can with satisfaction enough own a no very handsome wife in his bosom; yet who is bold enough openly to avow, that he has espoused a falsehood, and received into his breast so ugly a thing as a lie? whilst the parties of men cram their tenets down all men's throats, whom they can get into their power, without permitting them to examine their truth or falsehood, and will not let truth have fair play in the world, nor men the liberty to search after it; what improvements can be expected of this kind? What greater light can be hoped for in the moral sciences? The subject part of mankind, in most places, might, instead thereof, with Egyptian bondage expect Egyptian darkness, were not the candle of the Lord set up by himself in men's minds, which it is impossible for the breath or power of man wholly to extinguish.

§ 21. *Fourthly, of real existence: we have an intuitive knowledge of our own; demonstrative, of God's; sensitive, of some few other things.*—As to the fourth sort of our knowledge, viz. of the real actual existence of things, we have an intuitive knowledge of our own existence; and a demonstrative knowledge of the existence of a God: of the existence of any thing else, we have no other but a sensitive knowledge, which extends not beyond the objects present to our senses.

§ 22. *Our ignorance great.*—Our knowledge being so narrow, as I have shewn, it will, perhaps, give us some light into the present state of our minds, if we look a little into the dark side, and take a view of our ignorance: which, being infinitely larger than our knowledge, may serve much to the quieting of disputes, and improvement of useful knowledge; if discovering how far we have clear and distinct ideas, we confine our thoughts within the contemplation of those things that are within the reach of our understandings, and launch not out into that abyss of darkness (where we have not eyes to see, nor faculties to perceive, any thing), out of a presumption, that nothing is beyond our comprehension. But to be satisfied of the folly of such a conceit, we need not go far. He that knows any thing, knows this in the first place, that he need not seek long for instances of his ignorance. The meanest and most obvious things that come in our way, have dark sides, that the quickest sight cannot penetrate into. The clearest and most enlarged understandings of thinking men, find themselves puzzled, and at a loss, in every particle of matter. We shall the less wonder to find it so, when we consider the causes of our ignorance which, from what has been said, I suppose will be found to be these three:

First, Want of ideas.

Secondly, Want of a discoverable connexion between the ideas we have.

Thirdly, Want of tracing and examining our ideas.

§ 23. *First, one cause of it, want of ideas, either such as we have no conception of, or such as particularly we have not.*—*First,* There are some things, and those not a few, that we are ignorant of, for want of ideas.

1. All the simple ideas we have, are confined (as I have shewn) to those we receive from corporeal objects by sensation, and from the operation of our own minds as the objects of reflection. But how much these few and narrow inlets are disproportionate to the vast whole ex-

tent of all beings, will not be hard to persuade those who are not so foolish as to think their span the measure of all things. What other simple ideas it is possible the creatures in other parts of the universe may have, by the assistance of senses and faculties more, or perfecter, than we have, or different from ours, it is not for us to determine; but to say or think there are no such, because we conceive nothing of them, is no better an argument, than if a blind man should be positive in it, that there was no such thing as sight and colours, because he had no manner of idea of any such thing, nor could by any means frame to himself any notions about seeing. The ignorance and darkness that is in us, no more hinders nor confines the knowledge that is in others, than the blindness of a mole is an argument against the quick-sightedness of an eagle. He that will consider the infinite power, wisdom, and goodness of the Creator of all things, will find reason to think it was not all laid out upon so inconsiderable, mean, and impotent a creature as he will find man to be; who, in all probability, is one of the lowest of all intellectual beings. What faculties therefore other species of creatures have, to penetrate into the nature and inmost constitutions of things; what ideas they may receive of them, far different from ours, we know not. This we know, and certainly find, that we want several other views of them, besides those we have, to make discoveries of them more perfect. And we may be convinced that the ideas we can attain to by our faculties, are very disproportionate to things themselves, when a positive, clear, distinct one of substance itself, which is the foundation of all the rest, is concealed from us. But want of ideas of this kind, being a part as well as cause of our ignorance, cannot be described. Only this I think I may confidently say of it, that the intellectual and sensible world, are in this perfectly alike; that that part, which we see of either of them, holds no proportion with what we see not; and whatsoever we can reach with our eyes, or our thoughts, of either of them, is but a point, almost nothing, in comparison with the rest.

§ 24. *Because of their remoteness*;—Another great cause of ignorance, is the want of ideas we are capable of. As the want of ideas, which our faculties are not able to give us, shuts us wholly from those views of things which it is reasonable to think other beings, more perfect than we, have, of which we know nothing; so the want of ideas I now speak of, keeps us in ignorance of things we conceive capable of being known to us. Bulk, figure, and motion, we have ideas of. But though we are not without ideas of these primary qualities of bodies in general; yet not knowing what is the particular bulk, figure, and motion of the greatest part of the bodies of the universe, we are ignorant of the several powers, efficacies, and ways of operation, whereby the effects which we daily see, are produced. These are hid from us in some things, by being too remote; and in others, by being too minute. When we consider the vast distance of the known and visible parts of the world, and the reasons we have to think, that what lies within our ken, is but a small part of the universe, we shall then discover a huge abyss of ignorance. What are the particular fabrics of the great masses of matter, which make up the whole stupendous frame of corporeal beings; how far they are extended, what is their motion, and how continued or con-

municated, and what influence they have one upon another; are contemplations that, at first glimpse, our thoughts lose themselves in. If we narrow our contemplations, and confine our thoughts to this little canton, I mean this system of our sun, and the grosser masses of matter that visibly move about it; what several sorts of vegetables, animals, and intellectual corporeal beings, infinitely different from those of our little spot of earth, may there probably be in the other planets, to the knowledge of which, even of their outward figures and parts, we can no way attain, whilst we are confined to this earth, there being no natural means, either by sensation or reflection, to convey their certain ideas into our minds? They are out of the reach of those inlets of all our knowledge: and what sorts of furniture and inhabitants those mansions contain in them, we cannot so much as guess, much less have clear and distinct ideas of them.

§ 25. *Or, because of their minuteness.*—If a great, nay, far the greatest, part of the several ranks of bodies in the universe, escape our notice by their remoteness, there are others that are no less concealed from us by their minuteness. These insensible corpuscles, being the active parts of matter, and the great instruments of nature, on which depend not only all their secondary qualities, but also most of their natural operations, our want of precise distinct ideas of their primary qualities, keeps us in an incurable ignorance of what we desire to know about them. I doubt not but if we could discover the figure, size, texture, and motion of the minute constituent parts of any two bodies, we should know, without trial, several of their operations one upon another, as we do now the properties of a square, or a triangle. Did we know the mechanical affections of the particles of rhubarb, hemlock, opium, and a man; as a watch-maker does those of a watch, whereby it performs its operations, and of a file which, by rubbing on them, will alter the figure of any of the wheels: we should be able to tell before-hand, that rhubarb will purge, hemlock kill, and opium make a man sleep; as well as a watch-maker can, that a little piece of paper laid on the balance, will keep the watch from going, till it be removed; or that some small part of it being rubbed by a file, the machine would quite lose its motion, and the watch go no more. The dissolving of silver in *aqua fortis*, and gold in *aqua regia*, and not *vice versâ*, would be then perhaps no more difficult to know, than it is to a smith to understand why the turning of one key will open a lock, and not the turning of another. But whilst we are destitute of senses acute enough to discover the minute particles of bodies, and to give us ideas of their mechanical affections, we must be content to be ignorant of their properties and ways of operation; nor can we be assured about them, any farther than some few trials we make are able to reach. But whether they will succeed again another time, we cannot be certain. This hinders our certain knowledge of universal truths concerning natural bodies; and our reason carries us herein very little beyond particular matter of fact.

§ 26. *Hence no science of bodies;*—And therefore I am apt to doubt, that how far soever human industry may advance useful and experimental philosophy in physical things, scientific will still be out of our reach; because we want perfect and adequate ideas of those very bodies,

which are nearest to us, and most under our command. Those which we have ranked into classes under names, and we think ourselves best acquainted with, we have but very imperfect and incomplete ideas of. Distinct ideas of the several sorts of bodies, that fall under the examination of our senses, perhaps we may have; but adequate ideas, I suspect, we have not of any one amongst them. And though the former of these will serve us for common use and discourse, yet whilst we want the latter, we are not capable of scientific knowledge, nor shall ever be able to discover general, instructive, unquestionable truths concerning them. Certainty and demonstration, are things we must not, in these matters, pretend to. By the colour, figure, taste, and smell, and other sensible qualities, we have as clear and distinct ideas of sage and hemlock, as we have of a circle and a triangle: but having no ideas of the particular primary qualities of the minute parts of either of these plants, nor of other bodies which we would apply them to, we cannot tell what effects they will produce; nor when we see those effects, can we so much as guess, much less know, their manner of production. Thus having no ideas of the particular mechanical affections of the minute parts of bodies, that are within our view and reach, we are ignorant of their constitutions, powers, and operations: and of bodies more remote we are yet more ignorant, not knowing so much as their very outward shapes, or the sensible and grosser parts of their constitutions.

§ 27. *Much less of spirits.*—This at first sight, will shew us how disproportionate our knowledge is to the whole extent even of material beings; to which, if we add the consideration of that infinite number of spirits that may be, and probably are, which are yet more remote from our knowledge, whereof we have no cognizance, nor can frame to ourselves any distinct ideas of their several ranks and sorts, we shall find this cause of ignorance conceal from us, in an impenetrable obscurity, almost the whole intellectual world; a greater certainly, and more beautiful world than the material. For bating some very few, and those, if I may so call them, superficial, ideas of spirit, which by reflection we get of our own, and from thence, the best we can collect, of the Father of all Spirits, the eternal independent Author of them, and us, and all things; we have no certain information, so much as of the existence of other spirits, but by revelation. Angels of all sorts are naturally beyond our discovery: and all those intelligences, whereof it is likely there are more orders than of corporeal substances, are things whereof our natural faculties give us no certain account at all. That there are minds and thinking beings in other men as well as himself, every man has a reason, from their words and actions, to be satisfied: and the knowledge of his own mind cannot suffer a man, that considers, to be ignorant that there is a God. But that there are degrees of spiritual beings between us and the great God, who is there that by his own search and ability can come to know? Much less have we distinct ideas of their different natures, conditions, states, powers, and several constitutions, wherein they agree or differ from one another, and from us. And therefore in what concerns their different species and properties, we are under an absolute ignorance.

§ 28. *Secondly, want of a discoverable connexion between ideas we*

have.—*Secondly*, What a small part of the substantial beings, that are in the universe, the want of ideas leaves open to our knowledge, we have seen. In the next place, another cause of ignorance, of no less moment, is a want of a discoverable connexion between those ideas we have. For wherever we want that, we are utterly incapable of universal and certain knowledge; and are, in the former case, left only to observation and experiment; which, how narrow and confined it is, how far from general knowledge, we need not be told. I shall give some few instances of this cause of our ignorance, and so leave it. It is evident that the bulk, figure, and motion of several bodies about us, produce in us several sensations, as of colours, sounds, tastes, smells, pleasure and pain, &c. These mechanical affections of bodies, having no affinity at all with those ideas they produce in us (there being no conceivable connexion between any impulse of any sort of body, and any perception of a colour or smell, which we find in our minds), we can have no distinct knowledge of such operations beyond our experience; and can reason no otherwise about them, than as effects produced by the appointment of an infinitely Wise Agent, which perfectly surpass our comprehensions. As the ideas of sensible secondary qualities, which we have in our minds, can, by us, be no way deduced from bodily causes, nor any correspondence or connexion be found between them and those primary qualities which (experience shews us) produce them in us; so, on the other side, the operation of our minds upon our bodies is as inconceivable. How any thought should produce a motion in body, is as remote from the nature of our ideas, as how any body should produce any thought in the mind. That it is so, if experience did not convince us, the consideration of the things themselves would never be able, in the least, to discover to us. These, and the like, though they have a constant and regular connexion, in the ordinary course of things; yet that connexion being not discoverable in the ideas themselves, which appearing to have no necessary dependence one on another, we can attribute their connexion to nothing else, but the arbitrary determination of that All-wise Agent, who has made them to be, and to operate as they do, in a way wholly above our weak understanding to conceive.

§ 29. *Instances*—In some of our ideas there are certain relations, habitudes, and connexions, so visibly included in the nature of the ideas themselves, that we cannot conceive them separable from them, by any power whatsoever. And in these only, we are capable of certain and universal knowledge. Thus the idea of a right-lined triangle, necessarily carries with it an equality of its angles to two right ones. Nor can we conceive this relation, this connexion of these two ideas, to be possibly mutable, or to depend on any arbitrary power, which of choice made it thus, or could make it otherwise. But the coherence and continuity of the parts of matter; the production of sensation in us of colours and sounds, &c. by impulse and motion; nay, the original rules and communication of motion being such, wherein we can discover no natural connexion with any ideas we have, we cannot but ascribe them to the arbitrary will and good pleasure of the Wise Architect. I need not, I think, here mention the resurrection of the dead, the future state of this globe of earth, and such other things, which are by every one

acknowledged to depend wholly on the determination of a free agent. The things that, as far as our observation reaches, we constantly find to proceed regularly, we may conclude do act by a law set them; but yet by a law that we know not: whereby, though causes work steadily, and effects constantly flow from them, yet their connexions and dependencies being not discoverable in our ideas, we can have but an experimental knowledge of them. From all which it is easy to perceive what a darkness we are involved in, how little it is of being, and the things are, that we are capable to know. And therefore we shall do no injury to our knowledge, when we modestly think with ourselves, that we are so far from being able to comprehend the whole nature of the universe, and all the things contained in it, that we are not capable of a philosophical knowledge of the bodies that are about us, and make a part of us: concerning their secondary qualities, powers, and operations, we can have no universal certainty. Several effects come every day within the notice of our senses, of which we have so far sensitive knowledge: but the causes, manner, and certainty of their production, for the two foregoing reasons, we must be content to be very ignorant of. In these we can go no farther than particular experience informs us of matter of fact, and by analogy to guess what effects the like bodies are, upon other trials, like to produce. But as to a perfect science of natural bodies (not to mention spiritual beings), we are, I think, so far from being capable of any such thing, that I conclude it lost labour to seek after it.

§ 30. *Thirdly, want of tracing our ideas.*—*Thirdly,* Where we have adequate ideas, and where there is a certain and discoverable connexion between them, yet we are often ignorant, for want of tracing those ideas which we have, or may have, and for want of finding out those intermediate ideas, which may shew us what habitude of agreement or disagreement they have one with another. And thus many are ignorant of mathematical truths, not out of any imperfection of their faculties, or uncertainty in the things themselves, but for want of application in acquiring, examining, and by due ways comparing those ideas. That which has most contributed to hinder the due tracing of our ideas, and finding out their relations, and agreements or disagreements one with another, has been, I suppose, the ill use of words. It is impossible that men should ever truly seek, or certainly discover, the agreement or disagreement of ideas themselves, whilst their thoughts flutter about, or stick only in, sounds of doubtful and uncertain significations. Mathematicians abstracting their thoughts from names, and accustoming themselves to set before their minds the ideas themselves, that they would consider, and not sounds instead of them, have avoided thereby a great part of that perplexity, puddering, and confusion, which have so much hindered men's progress in other parts of knowledge. For whilst they stick in words of undetermined and uncertain signification, they are unable to distinguish true from false, certain from probable, consistent from inconsistent, in their own opinions. This having been the fate or misfortune of a great part of men of letters, the increase brought into the stock of real knowledge, has been very little, in proportion to the schools, disputes, and writings, the world has been filled with; whilst

students, being lost in the great wood of words, knew not whereabouts they were, how far their discoveries were advanced, or what was wanting in their own, or the general stock of knowledge. Had men, in the discoveries of the material, done as they have in those of the intellectual, world, involved in all the obscurity of uncertain and doubtful ways of talking, volumes writ of navigation and voyages, theories and stories of zones and tides, multiplied and disputed; nay, ships built, and fleets sent out, would never have taught us the way beyond the line; and the antipodes would be still as much unknown, as when it was declared heresy to hold there were any. But having spoken sufficiently of words, and the ill or careless use that is commonly made of them, I shall not say any thing more of it here.

§ 31. *Extent, in respect of universality.*—Hitherto we have examined the extent of our knowledge, in respect of the several sorts of beings that are. There is another extent of it, in respect of universality, which will also deserve to be considered; and in this regard, our knowledge follows the nature of our ideas. If the ideas are abstract, whose agreement or disagreement we perceive, our knowledge is universal. For what is known of such general ideas, will be true of every particular thing, in whom that essence, i. e. that abstract idea, is to be found; and what is once known of such ideas, will be perpetually and for ever true. So that as to all general knowledge, we must search and find it only in our minds; and it is only the examining of our own ideas, that furnisheth us with that. Truths belonging to essences of things (that is, to abstract ideas), are eternal, and are to be found out by the contemplation only of those essences: as the existences of things is to be known only from experience. But having more to say of this in the chapters where I shall speak of general and real knowledge, this may here suffice as to the universality of our knowledge in general.

CHAP. IV.

OF THE REALITY OF KNOWLEDGE.

§ 1. *Objection.* *Knowledge placed in ideas, may be all bare vision.*—I doubt not but my reader by this time may be apt to think, that I have been all this while only building a castle in the air; and be ready to say to me, “To what purpose all this stir? Knowledge, say you, is only the perception of the agreement or disagreement of our own ideas: but who knows what those ideas may be? Is there any thing so extravagant, as the imaginations of men’s brains? Where is the head that has no chimeras in it? Or, if there be a sober and a wise man, what difference will there be, by your rules, between his knowledge, and that of the most extravagant fancy in the world? They both have their ideas, and perceive their agreement and disagreement one with another. If there be any difference between them, the advantage will be on the warm-headed man’s side, as having the more ideas, and the more lively. And, so, by your rules, he will be the more knowing. If it be true, that all knowledge lies only in the perception of the agreement or disagreement of our own ideas, the visions of an enthusiast, and the rea-

sonings of a sober man, will be equally certain. It is no matter how things are; so a man observe but the agreement of his own imaginations, and talk conformably, it is all truth, all certainty. Such castles in the air, will be as strong holds of truth as the demonstrations of Euclid. That a harpy is not a centaur, is by this way as certain knowledge, and as much a truth, as that a square is not a circle.

“But of what use is all this fine knowledge of men’s own imaginations, to a man that inquires after the reality of things? It matters not what men’s fancies are, it is the knowledge of things that is only to be prized; it is this alone gives a value to our reasonings, and preference to one man’s knowledge over another’s, that it is of things as they really are, and not of dreams and fancies.”

§ 2. *Answer, not so, where ideas agree with things.*—To which I answer, that if our knowledge of our ideas terminate in them, and reach no farther, where there is something farther intended, our most serious thoughts will be of little more use, than the reveries of a crazy brain; and the truths built thereon, of no more weight, than the discourse of a man, who sees things clearly in a dream, and with great assurance utters them. But I hope, before I have done, to make it evident, that this way of certainty, by the knowledge of our own ideas, goes a little farther than bare imagination: and I believe it will appear, that all the certainty of general truths a man has, lies in nothing else.

§ 3. It is evident, the mind knows not things immediately, but only by the intervention of the ideas it has of them. Our knowledge therefore is real, only so far as there is a conformity between our ideas and the reality of things. But what shall be here the criterion? How shall the mind, when it perceives nothing but its own ideas, know that they agree with things themselves? This, though it seems not to want difficulty, yet I think there be two sorts of ideas, that, we may be assured, agree with things.

§ 4. *As, first, all simple ideas do.*—*First,* The first are simple ideas, which, since the mind, as has been shewn, can by no means make to itself, must necessarily be the product of things operating on the mind in a natural way, and producing therein those perceptions which, by the wisdom and will of our Maker, they are ordained and adapted to. From whence it follows, that simple ideas are not fictions of our fancies, but the natural and regular productions of things without us, really operating upon us; and so carry with them all the conformity which is intended, or which our state requires; for they represent to us things under those appearances which they are fitted to produce in us; whereby we are enabled to distinguish the sorts of particular substances, to discern the states they are in, and so to take them for our necessities, and to apply them to our uses. Thus the idea of whiteness or bitterness, as it is in the mind, exactly answering that power which is in any body to produce it there, has all the real conformity it can, or ought to have, with things without us. And this conformity between our simple ideas, and the existence of things, is sufficient for real knowledge.

§ 5. *Secondly, all complex ideas, except of substances.*—*Secondly,* All our complex ideas, except those of substances, being archetypes of the mind’s own making, not intended to be the copies of any thing, nor

referred to the existence of any thing as to their originals, cannot want any conformity necessary to real knowledge. For that which is not designed to represent any thing but itself, can never be capable of a wrong representation, nor mislead us from the true apprehension of any thing, by its dislikeness to it: and such, excepting those of substances, are all our complex ideas. Which, as I have shewn in another place, are combinations of ideas, which the mind, by its free choice, puts together, without considering any connexion they have in nature. And hence it is, that in all these sorts the ideas themselves are considered as the archetypes, and things no otherwise regarded, but as they are conformable to them. So that we cannot but be infallibly certain that all the knowledge we attain concerning these ideas, is real, and reaches things themselves. Because in all our thoughts, reasonings, and discourses of this kind, we intend things no farther, than as they are conformable to our ideas. So that in these, we cannot miss of a certain and undoubted reality.

§ 6. *Hence the reality of mathematical knowledge.*—I doubt not but it will be easily granted, that the knowledge we have of mathematical truths, is not only certain, but real, knowledge; and not the bare empty vision of vain insignificant chimeras of the brain; and yet, if we will consider, we shall find that it is only of our own ideas. The mathematician considers the truth and properties belonging to a rectangle or circle, only as they are in idea in his own mind. For it is possible he never found either of them existing mathematically, i. e. precisely true, in his life. But yet the knowledge he has of any truths or properties belonging to a circle, or any other mathematical figure, are nevertheless true and certain, even of real things existing: because real things are no farther concerned, nor intended to be meant by any such propositions, than as things really agree to those archetypes in his mind. Is it true of the idea of a triangle, that its three angles are equal to two right ones? It is true also of a triangle, wherever it really exists. Whatever other figure exists, that is not exactly answerable to the idea of a triangle in his mind, is not at all concerned in that proposition. And therefore he is certain all his knowledge concerning such ideas, is real knowledge: because, intending things no farther than they agree with those his ideas, he is sure what he knows concerning those figures, when they have barely an ideal existence in his mind, will hold true of them also, when they have a real existenee in matter; his consideration being barely of those figures, which are the same, wherever, or however, they exist.

§ 7. *And of moral.*—And hence it follows, that moral knowledge is as capable of real certainty, as mathematics. For certainty being but the perception of the agreement or disagreement of our ideas; and demonstration nothing but the perception of such agreement, by the intervention of other ideas, or mediums, our moral ideas, as well as mathematical, being archetypes themselves, and so adequate and complete ideas; all the agreement or disagreement which we shall find in them, will produce real knowledge, as well as in mathematical figures.

§ 8. *Existence not required to make it real.*—For the attaining of knowledge and certainty, it is requisite that we have determined ideas:

and to make our knowledge real, it is requisite that the ideas answer their archetypes. Nor let it be wondered, that I place the certainty of our knowledge in the consideration of our ideas, with so little care and regard (as it may seem) to the real existence of things: since most of those discourses, which take up the thoughts, and engage the disputes, of those who pretend to make it their business to inquire after truth and certainty, will, I presume, upon examination, be found to be general propositions, and notions in which existence is not at all concerned. All the discourses of the mathematicians, about the squaring of a circle, conic sections, or any other part of mathematics, concern not the existence of any of these figures, but their demonstrations, which depend on their ideas, are the same, whether there be any square or circle existing in the world, or no. In the same manner, the truth and certainty of moral discourses abstracts from the lives of men, and the existence of those virtues in the world whereof they treat: nor are Tully's Offices less true, because there is nobody in the world that exactly practises his rules, and lives up to that pattern of a virtuous man, which he has given us, and which existed no where, when he writ, but in idea. If it be true in speculation, i. e. in idea, that murder deserves death, it will also be true in reality of any action that exists conformable to that idea of murder. As for other actions, the truth of that proposition concerns them not. And thus it is of all other species of things, which have no other essences, but those ideas which are in the minds of men.

§ 9. *Nor will it be less true or certain, because moral ideas are of our own making and naming.*—But it will here be said, that if moral knowledge be placed in the contemplation of our own moral ideas, and those, as other modes, be of our own making, what strange notions will there be of justice and temperance? What confusion of virtues and vices, if every one may make what ideas of them he pleases? no confusion nor disorder in the things themselves, nor in the reasonings about them; no more than (in mathematics) there would be a disturbance in the demonstration, or a change in the properties of figures, and their relations one to another, if a man should make a triangle with four corners, or a *trapezium* with four right angles: that is, in plain English, change the names of the figures, and call that by one name, which mathematicians call ordinarily by another. For let a man make to himself the idea of a figure with three angles, whereof one is a right one, and call it, if he please, *equilaterum* or *trapezium*, or any thing else, the properties of, and demonstrations about, that idea will be the same, as if he had called it a rectangular triangle. I confess, the change of the name, by the impropriety of speech, will at first disturb him who knows not what idea it stands for; but as soon as the figure is drawn, the consequences and demonstration are plain and clear. Just the same is it in moral knowledge; let a man have the idea of taking from others, without their consent, what their honest industry has possessed them of, and call this justice, if he please. He that takes the name here without the idea put to it, will be mistaken, by joining another idea of his own to that name; but strip the idea of that name, or take it, such as it is, in the speaker's mind, and the same things will agree to it, as if you called it injustice. Indeed, wrong names in moral discourses breed

usually more disorder, because they are not so easily rectified as in mathematics, where the figure once drawn and seen, makes the name useless and of no force. For what need of a sign, when the thing signified is present and in view? But in moral names, that cannot be so easily and shortly done, because of the many decompositions that go to the making up the complex ideas of those modes. But yet for all this, miscalling of any of those ideas, contrary to the usual signification of the words of that language, hinders not but that we may have certain and demonstrative knowledge of their several agreements and disagreements, if we will carefully, as in mathematics, keep to the same precise ideas, and trace them in their several relations one to another, without being led away by their names. If we but separate the idea under that consideration from the sign that stands for it, our knowledge goes equally on in the discovery of real truth and certainty, whatever sounds we make use of.

§ 10. *Misnaming, disturbs not the certainty of the knowledge.*—One thing more we are to take notice of, that where God, or any other law-maker, hath defined any moral names, there they have made the essence of that species to which that name belongs; and there it is not safe to apply or use them otherwise. But in other cases, it is bare impropriety of speech to apply them contrary to the common usage of the country. But yet even this too disturbs not the certainty of that knowledge, which is still to be had by a due contemplation and comparing of those even nick-named ideas.

§ 11. *Ideas of substances have their archetypes without us.*—*Thirdly,* There is another sort of complex ideas, which being referred to archetypes without us, may differ from them, and so our knowledge about them may come short of being real. Such are our ideas of substances, which consisting of a collection of simple ideas, supposed taken from the works of nature, may yet vary from them, by having more or different ideas united in them, than are to be found united in the things themselves; from whence it comes to pass, that they may, and often do, fail of being exactly conformable to things themselves.

§ 12. *So far as they agree with those, so far our knowledge concerning them is real.*—I say then, that to have ideas of substances, which by being conformable to things, may afford us real knowledge, it is not enough, as in modes, to put together such ideas as have no inconsistency, though they did never before so exist; v. g. the ideas of sacrilege or perjury, &c. were as real and true ideas before, as after, the existence of any such fact. But our ideas of substances being supposed copies, and referred to archetypes without us, must still be taken from something that does or has existed; they must not consist of ideas put together at the pleasure of our thoughts, without any real pattern they were taken from, though we can perceive no inconsistency in such a combination. The reason whereof is, because we knowing not what real constitution it is of substances, whereon our simple ideas depend, and which really is the cause of the strict union of some of them one with another, and the exclusion of others; there are very few of them that we can be sure are, or are not inconsistent in nature, any farther than experience and sensible observation reach. Herein, therefore, is

founded the reality of our knowledge concerning substances, that all our complex ideas of them must be such, and such only, as are made up of such simple ones, as have been discovered to co-exist in nature. And our ideas being thus true, though not, perhaps, very exact, copies, are yet the subjects of real (as far as we have any) knowledge of them. Which (as has been already shewn) will not be found to reach very far: but so far as it does, it will still be real knowledge. Whatever ideas we have, the agreement we find they have with others, will still be knowledge. If those ideas be abstract, it will be general knowledge. But to make it real concerning substances, the ideas must be taken from the real existence of things. Whatever simple ideas have been found to co-exist in any substance, these we may, with confidence, join together again, and so make abstract ideas of substances. For whatever have once had a union in nature, may be united again.

§ 13. *In our inquiries about substances, we must consider ideas, and not confine our thoughts to names or species supposed set out by names.*—This if we rightly consider, and confine not our thoughts and abstract ideas to names, as if there were, or could be, no other sorts of things, than what known names had already determined, and, as it were, set out, we should think of things with greater freedom, and less confusion, than perhaps we do. It would possibly be thought a bold paradox, if not a very dangerous falsehood, if I should say, that some changelings, who have lived forty years together, without any appearance of reason, are something between a man and a beast: which prejudice is founded upon nothing else but a false supposition, that these two names, man and beast, stand for distinct species so set out by real essences, that there can come no other species between them: whereas, if we will abstract from those names, and the supposition of such specific essences made by nature, wherein all things of the same denominations did exactly and equally partake; if we would not fancy that there were a certain number of these essences, wherein all things, as in moulds, were cast and formed, we should find that the idea of the shape, motion, and life of a man, without reason, is as much a distinct idea, and makes as much a distinct sort of things from man and beast, as the idea of the shape of an ass with reason, would be different from either that of man or beast, and be a species of an animal between, or distinct from both.

§ 14. *Objection against a changeling being something between a man and beast, answered.*—Here every body will be ready to ask, If changelings may be supposed something between man and beast, pray what are they? I answer, changelings, which is as good a word to signify something different from the signification of man or beast, as the names man and beast are to have significations different one from the other. This, well considered, would resolve this matter, and shew my meaning without any more ado. But I am not so unacquainted with the zeal of some men, which enables them to spin consequences, and to see religion threatened, whenever any one ventures to quit their forms of speaking, as not to foresee what names such a proposition as this is like to be charged with; and without doubt it will be asked, If changelings are something between man and beast, what will become of them

in the other world? To which I answer, *First*, It concerns me not to know or inquire. To their own master they stand or fall. It will make their state neither better nor worse, whether we determine any thing of it, or no. They are in the hands of a faithful Creator, and a bountiful Father, who disposes not of his creatures according to our narrow thoughts or opinions, nor distinguishes them according to names and species of our contrivance. And we that know so little of this present world we are in, may, I think, content ourselves without being peremptory in defining the different states which creatures shall come into, when they go off this stage. It may suffice us, that he hath made known to all those who are capable of instruction, discoursing, and reasoning, that they shall come to an account, and receive according to what they have done in this body.

§ 15. But, *Secondly*, I answer, the force of these men's question (viz. will you deprive changelings of a future state?) is founded on one of these two suppositions, which are both false. The first is, that all things that have the outward shape and appearance of a man, must necessarily be designed to an immortal future being after this life. Or, secondly, that whatever is of human birth, must be so. Take away these imaginations, and such questions will be groundless and ridiculous. I desire, then, those who think there is no more but an accidental difference between themselves and changelings, the essence in both being exactly the same, to consider, whether they can imagine immortality annexed to any outward shape of the body; the very proposing it, is, I suppose, enough to make them disown it. No one yet, that ever I heard of, how much soever immersed in matter, allowed that excellency to any figure of the gross sensible outward parts, as to affirm eternal life due to it, or a necessary consequence of it; or that any mass of matter should, after its dissolution here, be again restored hereafter to an everlasting state of sense, perception, and knowledge, only because it was moulded into this or that figure, and had such a particular frame of its visible parts. Such an opinion as this, placing immortality in a certain superficial figure, turns out of doors all consideration of soul or spirit, upon whose account alone, some corporeal beings have hitherto been concluded immortal, and others not. This is to attribute more to the outside, than inside, of things; to place the excellency of a man, more in the external shape of his body, than internal perfections of his soul; which is but little better than to annex the great and inestimable advantage of immortality and life everlasting, which he has above other material beings, to annex it, I say, to the cut of his beard, or the fashion of his coat. For this or that outward mark of our bodies, no more carries with it the hope of an eternal duration, than the fashion of a man's suit gives him reasonable grounds to imagine it will never wear out, or that it will make him immortal. It will, perhaps be said, that nobody thinks that the shape makes any thing immortal; but it is the shape is the sign of a rational soul within, which is immortal. I wonder who made it the sign of any such thing; for barely saying it, will not make it so. It would require some proofs to persuade one of it. No figure that I know speaks any such language. For it may as rationally be concluded, that the dead body of a man, wherein there is to be found no more ap-

pearance or action of life, than there is in a statue, has yet nevertheless a living soul it, because of its shape; as that there is a rational soul in a changeling, because he has the outside of a rational creature, when his actions carry far less marks of reason with them, in the whole course of his life, than what are to be found in many a beast.

§ 16. *Monsters.*—But it is the issue of rational parents, and must therefore be concluded to have a rational soul. I know not by what logic you must so conclude. I am sure this is a conclusion that men no where allow of. For if they did, they would not make bold, as every where they do, to destroy ill-formed and mis-shaped productions. Ay, but these are monsters. Let them be so; what will your driveling, unintelligent, intractable changeling be? Shall a defect in the body make a monster; a defect in the mind (the far more noble, and, in the common phrase, the far more essential part), not? Shall the want of a nose, or a neck, make a monster, and put such issue out of the rank of men; the want of reason and understanding, not? This is to bring all back again to what was exploded just now; this is to place all in the shape, and take the measure of a man only by his outside. To shew that, according to the ordinary way of reasoning in this matter, people do lay the whole stress on the figure, and resolve the whole essence of the species of man (as they make it) into the outward shape, how unreasonable soever it be, and how much soever they disown it, we need but trace their thoughts and practice a little farther, and then it will plainly appear. The well-shaped changeling is a man, has a rational soul, though it appear not; this is past doubt, say you. Make the ears a little longer, and more pointed, and the nose a little flatter than ordinary, and then you begin to boggle; make the face yet narrower, flatter, and longer, and then you are at a stand; add still more and more of the likeness of a brute to it, and let the head be perfectly that of some other animal, then presently it is a monster; and it is demonstration with you that it hath no rational soul, and must be destroyed. Where now, I ask, shall be the just measure of the utmost bounds of that shape, that carries with it a rational soul? for since there have been human fœtuses produced, half beast, and half man; and others, three parts one, and one part the other; and so it is possible they may be in all the variety of approaches to the one or the other shape, and may have several degrees of mixture of the likeness of a man or a brute; I would gladly know what are those precise lineaments, which, according to this hypothesis, are, or are not, capable of a rational soul to be joined to them. What sort of outside is the certain sign that there is, or is not, such an inhabitant within? For till that be done, we talk at random of man; and shall always, I fear, do so, as long as we give ourselves up to certain sounds, and the imaginations of settled and fixed species in nature, we know not what. But after all, I desire it may be considered, that those who think they have answered the difficulty, by telling us, that a mis-shaped fœtus is a monster, run into the same fault they are arguing against by constituting a species between man and beast. For what else, I pray, is their monster in the case (if the word monster signifies any thing at all), but something neither man nor beast, but partaking somewhat of either? And just so is the change-

ling before-mentioned. So necessary is it to quit the common notion of species and essences, if we will truly look into the nature of things, and examine them, by what our faculties can discover in them as they exist, and not by groundless fancies, that have been taken up about them.

§ 17. *Words and species.*—I have mentioned this here, because I think we cannot be too cautious that words and species, in the ordinary notions which we have been used to of them, impose not on us. For I am apt to think, therein lies one great obstacle to our clear and distinct knowledge, especially in reference to substances; and from thence has risen a great part of the difficulties about truth and certainty. Would we accustom ourselves to separate contemplations, and our reasonings from words, we might, in a great measure, remedy this inconvenience within our own thoughts; but yet it would still disturb us in our discourse with others, as long as we retained the opinion, that species and their essences were any thing else but our abstract ideas (such as they are), with names annexed to them, to be the signs of them.

§ 18. *Recapitulations.*—Wherever we perceive the agreement or disagreement of any of our ideas, there is certain knowledge; and wherever we are sure those ideas agree with the reality of things, there is certain real knowledge. Of which agreement of our ideas with the reality of things, having here given the marks, I think, I have shewn wherein it is, that certainty, real certainty, consists. Which, whatever it was to others, was, I confess, to me, heretofore, one of those *desiderata* which I found great want of.

CHAP. V.

OF TRUTH IN GENERAL.

§ 1. *What truth is.*—What is truth? was an inquiry many ages since: and it being that which all mankind either do, or pretend to, search after, it cannot but be worth our while carefully to examine wherein it consists; and so acquaint ourselves with the nature of it, as to observe how the mind distinguishes it from falsehood.

§ 2. *A right joining or separating of signs, i. e. ideas or words.*—Truth then seems to me, in the proper import of the word, to signify nothing but the joining or separating of signs, as the things signified by them, to agree or disagree one with another. The joining or separating of signs here meant, is what by another name we call proposition. So that truth properly belongs only to propositions; whereof there are two sorts, viz. mental and verbal; as there are two sorts of signs commonly made use of, viz. ideas and words.

§ 3. *Which make mental or verbal propositions.*—To form a clear notion of truth, it is very necessary to consider truth of thought, and truth of words, distinctly one from another; but yet it is very difficult to treat of them asunder; because it is unavoidable in treating of mental propositions, to make use of words; and then the instances given of mental propositions, cease immediately to be barely mental, and become verbal. For a mental proposition being nothing but a bare consideration of the ideas, as they are in our minds stripped of names, they

lose the nature of purely mental propositions, as soon as they are put into words.

§ 4. *Mental propositions are very hard to be treated of.*—And that which makes it yet harder to treat of mental and verbal propositions separately, is, that most men, if not all, in their thinking and reasonings within themselves, make use of words instead of ideas, at least when the subject of their meditation contains in it complex ideas. Which is a great evidence of the imperfection and uncertainty of our ideas of that kind, and may, if attentively made use of, serve for a mark to shew us what are those things we have clear and perfect established ideas of, and what not. For if we will curiously observe the way our mind takes in thinking and reasoning, we shall find, I suppose, that when we make any propositions within our own thoughts, about white or black, sweet or bitter, a triangle or a circle, we can, and often do, frame in our minds the ideas themselves, without reflecting on the names. But when we would consider or make propositions about the more complex ideas, as of a man, vitriol, fortitude, glory, we usually put the name for the idea; because the ideas these names stand for, being for the most part imperfect, confused, and undetermined, we reflect on the names themselves, because they are more clear, certain, and distinct, and readier occur to our thoughts than the pure ideas; and so we make use of these words instead of the ideas themselves, even when we would meditate and reason within ourselves, and make tacit and mental propositions. In substances, as has been already noticed, this is occasioned by the imperfection of our ideas; we making the name stand for the real essence, of which we have no idea at all. In modes, it is occasioned by the great number of simple ideas that go to the making them up. For many of them being compounded, the name occurs much easier than the complex idea itself, which requires time and attention to be recollected, and exactly represented to the mind, even in those men who have formerly been at the pains to do it; and is utterly impossible to be done by those, who, though they have ready in their memory the greatest part of the common words of that language, yet perhaps never troubled themselves, in all their lives, to consider what precise ideas the most of them stood for. Some confused or obscure notions have served their turns; and many who talk very much of religion and conscience, of church and faith, of power and right, of obstructions and humours, melancholy and choler, perhaps, have little left in their thoughts and meditations, if one should desire them to think only of the things themselves, and lay by those words, with which they so often confound others, and not seldom themselves also.

§ 5. *Being nothing but the joining or separating ideas without words.*—But to return to the consideration of truth. We must, I say, observe two sorts of propositions that we are capable of making.

First, Mental, wherein the ideas in our understandings are without the use of words put together or separated by the mind, perceiving or judging of their agreement or disagreement.

Secondly, Verbal propositions, which are words, the signs of our ideas put together or separated in affirmative or negative sentences. By which way of affirming or denying, these signs made by sounds are, as

it were, put together or separated one from another. So that proposition consists in joining or separating signs, and truth consists in the putting together or separating those signs, according as the things which they stand for, agree or disagree.

§ 6. *When mental propositions contain real truth, and when verbal.*—Every one's experience will satisfy him, that the mind either by perceiving or supposing the agreement or disagreement of any of its ideas, does tacitly within itself put them into a kind of proposition affirmative or negative, which I have endeavoured to express by the terms putting together and separating. But this action of the mind, which is so familiar to every thinking and reasoning man, is easier to be conceived by reflecting on what passes in us, when we affirm or deny, than to be explained by words. When a man has in his head the idea of two lines, viz. the side and diagonal of a square, whereof the diagonal is an inch long, he may have the idea also of the division of that line into a certain number of equal parts; v. g. into five, ten, a hundred, a thousand, or any other number, and may have the idea of that inch line, being divisible, or not divisible, into such equal parts, as a certain number of them will be equal to the side line. Now, whenever he perceives, believes, or supposes such a kind of divisibility to agree or disagree to his idea of that line, he, as it were, joins or separates those two ideas, viz. the idea of that line, and the idea of that kind of divisibility, and so makes a mental proposition, which is true or false, according as such a kind of divisibility, a divisibility into such aliquot parts, does really agree to that line or no. When ideas are so put together, or separated in the mind, as they, or the things they stand for, do agree or not, that is, as I may call it, mental truth. But truth of words is something more, and that is the affirming or denying of words one of another, as the ideas they stand for agree or disagree: and this again is two-fold; either purely verbal and trifling, which I shall speak of, ch. 8. or real and instructive; which is the object of that real knowledge which we have spoken of already.

§ 7. *Objection against verbal truth, that thus it may all be chimerical.*—But here again will be apt to occur the same doubt about truth, that did about knowledge; and it will be objected, that if truth be nothing but the joining or separating of words in propositions, as the ideas they stand for agree, or disagree, in men's minds, the knowledge of truth is not so valuable a thing as it is taken to be; nor worth the pains and time men employ in the search of it; since, by this account, it amounts to no more than the conformity of words to the chimeras of men's brains. Who knows not what odd notions many men's heads are filled with, and what strange ideas all men's brains are capable of? but if we rest here, we know the truth of nothing by this rule, but of the visionary words in our own imaginations; nor have other truth but what as much concerns harpies and centaurs, as men and horses. For those, and the like, may be ideas in our heads, and have their agreement and disagreement there, as well as the ideas of real beings, and so have as true propositions made about them. And it will be altogether as true a proposition, to say all centaurs are animals, as that all men are animals; and the certainty of one as great as the other. For in both the

propositions, the words are put together according to the agreement of the ideas in our minds; and the agreement of the idea of animal with that of centaur, is as clear and visible to the mind, as the agreement of the idea of animal with that of man; and so these two propositions are equally true, equally certain. But of what use is all such truth to us?

§ 8. *Answered, real truth is about ideas agreeing to things.*—Though what has been said in the foregoing chapter, to distinguish real from imaginary knowledge, might suffice here, in answer to this doubt, to distinguish real truth from chimerical or (if you please) barely nominal, they depending both on the same foundation; yet it may not be amiss here again to consider, that though our words signify nothing but our ideas, yet being designed by them to signify things, the truth they contain when put into propositions, will be only verbal, when they stand for ideas in the mind, that have not an agreement with the reality of things. And, therefore, truth, as well as knowledge, may well come under the distinction of verbal and real; that being only verbal truth, wherein terms are joined according to the agreement or disagreement of the ideas they stand for, without regarding whether our ideas are such as really have, or are capable of having, an existence in nature. But then it is they contain real truth, when these signs are joined, as our ideas agree; and when our ideas are such as we know are capable of having an existence in nature; which in substances we cannot know, but by knowing that such have existed.

§ 9. *Falsehood is the joining of names otherwise than their ideas agree.*—Truth is the marking down in words, the agreement or disagreement of ideas as it is. Falsehood is the marking down in words, the agreement or disagreement of ideas otherwise than it is. And so far as these ideas, thus marked by sounds agree to their archetypes, so far only is truth real. The knowledge of this truth consists in knowing what ideas the words stand for, and the perception of the agreement or disagreement of those ideas, according as it is marked by those words.

§ 10. *General propositions to be treated of more at large.*—But because words are looked on as the great conduits of truth and knowledge, and that in conveying and receiving of truth, and commonly in reasoning about it, we make use of words and propositions, I shall more at large inquire, wherein the certainty of real truths, contained in propositions, consists, and where it is to be had; and endeavour to shew in what sort of universal propositions we are capable of being certain of their real truth or falsehood.

I shall begin with general propositions, as those which most employ our thoughts, and exercise our contemplation. General truths are most looked after by the mind, as those that most enlarge our knowledge; and by their comprehensiveness, satisfying us at once of many particulars, enlarge our view, and shorten our way to knowledge.

§ 11. *Moral and metaphysical truth.*—Besides truth, taken in the strict sense before-mentioned, there are other sorts of truths; as, *First*, Moral truth, which is speaking of things according to the persuasion of our own minds, though the proposition we speak agree not to the reality of things. *Secondly*, Metaphysical truth, which is nothing but the real existence of things, conformable to the ideas to which we have

annexed their names. This, though it seems to consist in the very beings of things, yet when considered a little nearly, will appear to include a tacit proposition, whereby the mind joins that particular thing to the idea it had before settled with a name to it. But these considerations of truth, either having been before taken notice of, or not being much to our present purpose, it may suffice here only to have mentioned them.

CHAP. VI.

OF UNIVERSAL PROPOSITIONS, THEIR TRUTH AND CERTAINTY.

§ 1. *Treating of words necessary to knowledge.*—Though the examining and judging of ideas by themselves, their names being quite laid aside, be the best and surest way to clear and distinct knowledge; yet through the prevailing custom of using sounds for ideas, I think it is very seldom practised. Every one may observe how common it is for names to be made use of, instead of the ideas themselves, even when men think and reason within their own breasts; especially if the ideas be very complex, and made up of a great collection of simple ones. This makes the consideration of words and propositions so necessary a part of the treatise of knowledge, that it is very hard to speak intelligibly of the one, without explaining the other.

§ 2. *General truths hardly to be understood, but in verbal propositions.*—All the knowledge we have, being only of particular or general truths, it is evident that whatever may be done in the former of these, the latter, which is that which with reason is most sought after, can never be well made known, and is very seldom apprehended, but as conceived and expressed in words. It is not therefore, out of our way, in the examination of our knowledge, to inquire into the truth and certainty of universal propositions.

§ 3. *Certainty two-fold, of truth and of knowledge.*—But that we may not be missed in this case, by that which is the danger every where, I mean by the doubtfulness of terms, it is fit to observe, that certainty is two-fold; certainty of truth, and certainty of knowledge. Certainty of truth is, when words are so put together in propositions, as exactly to express the agreement or disagreement of the ideas they stand for, as really it is. Certainty of knowledge, is to perceive the agreement or disagreement of ideas, as expressed in any proposition. This we usually call knowing, or being certain of the truth of any proposition.

§ 4. *No proposition can be known to be true, where the essence of each species mentioned is not known.*—Now because we cannot be certain of the truth of any general proposition, unless we know the precise bounds and extent of the species its terms stand for, it is necessary we should know the essence of each species, which is that which constitutes and bounds it. This, in all simple ideas and modes, is not hard to do. For in these the real and nominal essence being the same; or, which is all one, the abstract idea which the general term stands for, being the sole essence and boundary that is or can be supposed of the species, there can be no doubt how far the species extends, or what things are comprehended under each term: which, it is evident, are all that have

an exact conformity with the idea it stands for, and no other. But in substances, wherein a real essence distinct from the nominal, is supposed to constitute, determine, and bound the species, the extent of the general word is very uncertain; because not knowing this real essence, we cannot know what is, or what is not, of that species, and consequently what may, or may not, with certainty be affirmed of it. And thus speaking of a man, or gold, or any other species of natural substances, as supposed constituted by a precise and real essence which nature regularly imparts to every individual of that kind, whereby it is made to be of that species, we cannot be certain of the truth of any affirmation or negation made of it. For man, or gold, taken in this sense, and used for species of things, constituted by real essences, different from the complex idea in the mind of the speaker, stand for we know not what; and the extent of these species, with such boundaries, are so unknown and undetermined, that it is impossible, with any certainty, to affirm, that all men are rational, or that all gold is yellow. But where the nominal essence is kept to, as the boundary of each species, and men extend the application of any general term no farther than to the particular things in which the complex idea it stands for is to be found, there they are in no danger to mistake the bounds of each species, nor can be in doubt, on this account, whether any proposition be true, or no. I have chosen to explain this uncertainty of propositions in this scholastic way, and have made use of the terms of essences and species, on purpose to shew the absurdity and inconvenience there is to think of them, as of any other sort of realities, than barely abstract ideas with names to them. To suppose that the species of things are any thing but the sorting of them under general names, according as they agree to several abstract ideas, of which we make those names the signs, is to confound truth, and introduce uncertainty into all general propositions that can be made about them. Though, therefore, these things might, to people not possessed with scholastic learning, be treated of in a better and clearer way; yet those wrong notions of essences or species, having got root in most people's minds, who have received any tincture from the learning which has prevailed in this part of the world, are to be discovered and removed, to make way for that use of words which should convey certainty with it.

§ 5. *This more particularly concerns substances.*—The names of substances, then, whenever made to stand for species, which are supposed to be constituted by real essences which we know not, are not capable to convey certainty to the understanding; of the truth of general propositions made up of such terms, we cannot be sure. The reason whereof is plain. For how can we be sure that this or that quality is in gold, when we know not what is or is not gold? Since in this way of speaking, nothing is gold, but what partakes of an essence, which we not knowing, cannot know where it is, or is not, and so cannot be sure that any parcel of matter in the world, is, or is not, in this sense gold; being incurably ignorant, whether it has, or has not, that which makes any thing to be called gold, i. e. that real essence of gold whereof we have no idea at all. This being as impossible for us to know as it is for a blind man to tell in what flower the colour of a

pansy is, or is not, to be found, whilst he has no idea of the colour of a pansy at all. Or, if we could (which is impossible) certainly know where a real essence, which we know not, is; v. g. in what parcels of matter the real essence of gold is; yet could we not be sure, that this or that quality could with truth be affirmed of gold; since it is impossible for us to know, that this or that quality or idea has a necessary connexion with a real essence, of which we have no idea at all, whatever species that supposed real essence may be imagined to constitute.

§ 6. *The truth of few universal propositions, concerning substances, is to be known.*—On the other side, the name of substances, when made use of as they should be, for the ideas men have in their minds, though they carry a clear and determinate signification with them, will not yet serve us to make many universal propositions, of whose truth we can be certain. Not because in this use of them we are uncertain what things are signified by them, but because the complex ideas they stand for, are such combinations of simple ones, as carry not with them any discoverable connexion or repugnancy, but with a very few other ideas.

§ 7. *Because co-existence of ideas in few cases is to be known.*—The complex ideas that our names of the species of substances properly stand for, are collections of such qualities as have been observed to co-exist in an unknown *substratum*, which we call substance; but what other qualities necessarily co-exist with such combinations, we cannot certainly know, unless we can discover their natural dependence; which, in their primary qualities, we can go but a very little way in; and in all their secondary qualities, we can discover no connexion at all, for the reasons mentioned, ch. iii.; viz. 1. Because we know not the real constitutions of substances, on which each secondary quality particularly depends. 2. Did we know that, it would serve us only for experimental (not universal) knowledge; and reach with certainty no farther than that bare instance; because our understandings can discover no conceivable connexion between any secondary quality, and any modification whatsoever of any of the primary ones. And therefore there are very few general propositions to be made concerning substances, which can carry with them undoubted certainty.

§ 8. *Instance in gold.*—All gold is fixed, is a proposition whose truth we cannot be certain of, how universally soever it is believed. For if, according to the useless imagination of the schools, any one supposes the term gold to stand for a species of things set out by nature, by a real essence belonging to it, it is evident he knows not what particular substances are of that species; and so cannot, with certainty, affirm any thing universally of gold. But if he makes gold stand for a species, determined by its nominal essence, let the nominal essence, for example, be the complex idea of a body, of a certain yellow colour, malleable, fusible, and heavier than any other known; in this proper use of the word gold, there is no difficulty to know what is, or is not, gold. But yet no other quality can with certainty be universally affirmed or denied of gold, but what hath a discoverable connexion or inconsistency with that nominal essence. Fixedness, for example, having no neces-

sary connexion, that we can discover, with the colour, weight, or any other simple idea of our complex one, or with the whole combination together; it is impossible that we should certainly know the truth of this proposition, that all gold is fixed.

§ 9. As there is no discoverable connexion between fixedness, and the colour, weight, and other simple ideas of that nominal essence of gold; so if we make our complex idea of gold, a body yellow, fusible, ductile, weighty, and fixed, we shall be at the same uncertainty concerning solubility in *aqua regia*; and for the same reason: since we can never, from consideration of the ideas themselves, with certainty affirm or deny, of a body, whose complex idea is made up of yellow, very weighty, ductile, fusible, and fixed, that it is soluble in *aqua regia*, and so on of the rest of its qualities. I would gladly meet with one general affirmation, concerning any quality of gold, that any one can certainly know is true. It will, no doubt, be presently objected, is not this a universal certain proposition, "all gold is malleable?" To which I answer, it is a very certain proposition, if malleableness be a part of the complex idea the word gold stands for. But then here is nothing affirmed of gold, but that that sound stands for an idea in which malleableness is contained: and such a sort of truth and certainty as this, it is, to say a centaur is four-footed. But if malleableness makes not a part of the specific essence the name gold stands for, it is plain, "all gold is malleable," is not a certain proposition. Because let the complex idea of gold, be made up of which soever of its other qualities you please, malleableness will not appear to depend on that complex idea, nor follow from any simple one contained in it. The connexion that malleableness has (if it has any) with those other qualities, being only by the intervention of the real constitution of its insensible parts, which since we know not, it is impossible we should perceive that connexion, unless we could discover that which ties them together.

§ 10. *As far as any such co-existence can be known, so far universal propositions may be certain. But this will go but a little way, because*—The more, indeed, of those co-existing qualities we unite into one complex idea, under one name, the more precise and determinate we make the signification of that word: but yet never make it thereby more capable of universal certainty, in respect of other qualities, not contained in our complex idea; since we perceive not their connexion or dependence on one another; being ignorant both of that real constitution in which they are all founded, and also how they flow from it. For the chief part of our knowledge concerning substances, is not, as in other things, barely of the relation of two ideas that may exist separately: but it is of the necessary connexion and co-existence of several distinct ideas in the same subject, or of their repugnances so to co-exist. Could we begin at the other end, and discover what it was, wherein that colour consisted, what made a body lighter or heavier, what texture of parts made malleable, fusible, and fixed, and fit to be dissolved in this sort of liquor, and not in another; if (I say) we had such an idea as this of bodies, and could perceive wherein all sensible qualities originally consist, and how they are produced; we might frame such abstract ideas of them, as would furnish us with

matter of more general knowledge, and enable us to make universal propositions, that should carry general truth and certainty with them. But whilst our complex ideas of the sorts of substances, are so remote from that internal real constitution on which their sensible qualities depend, and are made up of nothing but an imperfect collection of those apparent qualities our senses can discover, there can be very few general propositions concerning substances, of whose real truth we can be certainly assured; since there are but few simple ideas, of whose connexion and necessary co-existence we can have certain and undoubted knowledge. I imagine, amongst all the secondary qualities of substances, and the powers relating to them, there cannot any two be named, whose necessary co-existence, or repugnance to co-exist, can certainly be known, unless in those of the same sense, which necessarily exclude one another, as I have elsewhere shewn. No one, I think, by the colour that is in any body, can certainly know what smell, taste, sound, or tangible qualities it has, nor what alterations it is capable to make or receive, on, or from, other bodies. The same may be said of the sound or taste, &c. Our specific names of substances standing for any collections of such ideas, it is not to be wondered, that we can, with them, make very few general propositions of undoubted real certainty. But yet, so far as any complex idea, of any sort of substances, contains in it any simple idea, whose necessary co-existence with any other may be discovered, so far universal propositions may with certainty be made concerning it; v. g. could any one discover a necessary connexion between malleableness, and the colour or weight of gold, or any other part of the complex idea, signified by that name, he might make a certain universal proposition concerning gold in this respect; and the real truth of this proposition, "that all gold is malleable," would be as certain as of this, "the three angles of all right-lined triangles, are equal to two right ones."

§ 11. *The qualities which make our complex idea of substances, depend mostly on external, remote, and unperceived causes.*—Had we such ideas of substances, as to know what real constitutions produce those sensible qualities we find in them, and how those qualities flowed from thence, we could, by the specific ideas of their real essences in our own minds, more certainly find out their properties and discover what qualities they had, or had not, than we can now by our senses; and to know the properties of gold, it would be no more necessary that gold should exist, and that we should make experiments upon it, than it is necessary for the knowing the properties of a triangle, that a triangle should exist in any matter; the idea in our minds would serve for the one, as well as the other. But we are so far from being admitted into the secrets of nature, that we scarce so much as ever approach the first entrance towards them. For we are wont to consider the substances we meet with, each of them as an entire thing by itself, having all its qualities in itself, and independent of other things: overlooking, for the most part, the operations of those invisible fluids they are encompassed with; and upon whose motions and operations depend the greatest part of those qualities which are taken notice of in them, and are made by us the inherent marks of distinction, whereby we know

and denominate them. Put a piece of gold any where by itself, separate from the reach and influence of all other bodies, it will immediately lose all its colour and weight, and, perhaps, malleableness too; which, for aught I know, would be changed into a perfect friability. Water, in which to us fluidity is an essential quality, left to itself, would cease to be fluid. But if inanimate bodies owe so much of their present state to other bodies without them, that they would not be what they appear to us, were those bodies that environ them removed, it is yet more so in vegetables, which are nourished, grow, and produce leaves, flowers, and seeds, in a constant succession. And if we look a little nearer into the state of animals, we shall find, that their dependence, as to life, motion, and the most considerable qualities to be observed in them, is so wholly on extrinsical causes and qualities of other bodies, that make no part of them, that they cannot subsist a moment without them; though yet those bodies on which they depend, are little taken notice of, and make no part of the complex ideas we frame of those animals. Take the air but a minute from the greatest part of living creatures, and they presently lose sense, life, and motion. This the necessity of breathing has forced into our knowledge. But how many other extrinsical, and possibly very remote bodies, do the springs of these admirable machines depend on, which are not vulgarly observed, or so much as thought on; and how many are there, which the severest inquiry can never discover? The inhabitants of this spot of the universe, though removed so many millions of miles from the sun, yet depend so much on the duly tempered motion of particles coming from, or agitated by it, that were this earth removed but a small part of that distance out of its present situation, and placed a little farther or nearer that source of heat, it is more than probable that the greatest part of the animals in it would immediately perish; since we find them so often destroyed by an excess or defect of the sun's warmth, which an accidental position, in some parts of this, our little globe, exposes them to. The qualities observed in a loadstone, must needs have their source far beyond the confines of that body; and the ravage made often on several sorts of animals, by invisible causes, the certain death (as we are told) of some of them, by barely passing the line, or, as it is certain, of others, by being removed into a neighbouring country, evidently shew, that the concurrence and operations of several bodies, with which they are seldom thought to have any thing to do, is absolutely necessary to make them be what they appear to us, and to preserve those qualities by which we know and distinguish them. We are then quite out of the way, when we think that things contain within themselves the qualities that appear to us in them; and we in vain search for that constitution within the body of a fly, or an elephant, upon which depend those qualities and powers we observe in them. For which, perhaps, to understand them aright, we ought to look, not only beyond this our earth and atmosphere, but even beyond the sun, or remotest star our eyes have yet discovered. For how much the being and operation of particular substances in this our globe, depends on causes utterly beyond our view, is impossible for us to determine. We see and perceive some of the motions, and grosser ope-

rations, of things here about us; but whence the streams come that keep all these curious machines in motion and repair, how conveyed and modified, is beyond our notice and apprehension; and the great parts and wheels, as I may so say, of this stupendous structure of the universe, may, for aught we know, have such a connexion and dependence in their influences and operations one upon another, that, perhaps, things in this, our mansion, would put on quite another face, and cease to be what they are, if some one of the stars or great bodies incomprehensibly remote from us, should cease to be or move as it does. This is certain, things however absolute and entire they seem in themselves, are but retainers to other parts of nature, for that which they are most taken notice of by us. Their observable qualities, actions, and powers, are owing to something without them; and there is not so complete and perfect a part that we know of nature, which does not owe the being it has, and the excellencies of it, to its neighbours; and we must not confine our thoughts within the surface of any body, but look a great deal farther, to comprehend perfectly those qualities that are in it.

§ 12. If this be so, it is not to be wondered, that we have very imperfect ideas of substances; and that the real essences on which depend their properties and operations, are unknown to us. We cannot discover so much as that size, figure, and texture, of their minute and active parts, which is really in them; much less the different motions and impulses made in and upon them by bodies from without, upon which depends, and by which is formed, the greatest and most remarkable part of those qualities we observe in them, and of which our complex ideas of them are made up. This consideration alone is enough to put an end to all our hopes of ever having the ideas of their real essences; which whilst we want, the nominal essences we make use of instead of them, will be able to furnish us but very sparingly with any general knowledge, or universal propositions, capable of real certainty.

§ 13. *Judgment may reach farther, but that is not knowledge.*— We are not, therefore, to wonder, if certainty be to be found in very few general propositions made concerning substances; our knowledge of their qualities and properties go very seldom farther than our senses reach and inform us. Possibly inquisitive and observing men may, by strength of judgment, penetrate farther, and on probabilities taken from wary observation, and hints well laid together, often guess right at what experience has not yet discovered to them. But this is but guessing still; it amounts only to opinion, and has not that certainty which is requisite to knowledge. For all general knowledge lies only in our own thoughts, and consists barely in the contemplation of our own abstract ideas. Wherever we perceive any agreement or disagreement amongst them, there we have general knowledge; and by putting the names of those ideas together accordingly in propositions, can with certainty pronounce general truths. But because the abstract ideas of substances, for which their specific names stand, whenever they have any distinct and determinate signification, have a discoverable connexion or inconsistency with but a very few other ideas: the certainty of universal propositions concerning substances, is very narrow and scanty in that part

which is our principal inquiry concerning them; and there are scarce any of the names of substances, let the idea it is applied to be what it will, of which we can generally, and with certainty, pronounce, that it has, or has not, this or that other quality belonging to it, and constantly co-existing or inconsistent with that idea, wherever it is to be found.

§ 14. *What is requisite for our knowledge of substances.*—Before we can have any tolerable knowledge of this kind, we must first know what changes the primary qualities of one body do regularly produce in the primary qualities of another, and how. *Secondly*, We must know what primary qualities of any body, produce certain sensations or ideas in us. This is, in truth, no less than to know all the effects of matter, under its divers modifications of bulk, figure, cohesion of parts, motion, and rest. Which, I think, every body will allow, is utterly impossible to be known by us, without revelation. Now if it were revealed to us, what sort of figure, bulk, and motion of corpuscles, would produce in us the sensation of a yellow colour, and what sort of figure, bulk, and texture of parts in the superficies of any body, were fit to give such corpuscles their due motion to produce that colour; would that be enough to make universal propositions with certainty, concerning the several sorts of them, unless we had faculties acute enough to perceive the precise bulk, figure, texture, and motion of bodies in those minute parts, by which they operate on our senses, so that we might by those frame our abstract ideas of them? I have mentioned here only corporeal substances, whose operations seem to lie more level to our understandings; for as to the operations of spirits, both their thinking and moving of bodies, we, at first sight, find ourselves at a loss; though, perhaps, when we have applied our thoughts a little nearer to the consideration of bodies, and their operations, and examined how far our notions, even in these, reach, with any clearness, beyond sensible matter of fact, we shall be bound to confess, that even in these too, our discoveries amount to very little beyond perfect ignorance and incapacity.

§ 15. *Whilst our ideas of substances contain not their real constitutions, we can make but few general certain propositions concerning them.*—This is evident, the abstract complex ideas of substances, for which their general names stand, not comprehending their real constitutions, can afford us very little universal certainty. Because our ideas of them are not made up of that on which those qualities we observe in them, and would inform ourselves about, do depend, or with which they have any certain connexion; v. g. let the ideas to which we give the name man, be, as it commonly is, a body of the ordinary shape, with sense, voluntary motion, and reason joined to it. This being the abstract idea, and consequently the essence of our species man, we can make but very few general certain propositions concerning man, standing for such an idea. Because not knowing the real constitution on which sensation, power of motion, and reasoning, with that peculiar shape, depend, and whereby they are united together in the same subject, there are very few other qualities, with which we can perceive them to have a necessary connexion; and therefore we cannot, with certainty, affirm, that all men sleep by intervals; that no man can be nourished

by wood or stones; that all men will be poisoned by hemlock; because these ideas have no connexion nor repugnancy with this our nominal essence of man, with this abstract idea that name stands for. We must in these, and the like, appeal to trial in particular subjects, which can reach but a little way. We must content ourselves with probability in the rest: but can have no general certainty, whilst our specific idea of man contains not that real constitution, which is the root wherein all his inseparable qualities are united, and from whence they flow. Whilst our idea the word man stands for, is only an imperfect collection of some sensible qualities and powers in him, there is no discernible connexion or repugnance between our specific idea, and the operation of either the parts of hemlock or stones, upon his constitution. There are animals that safely eat hemlock, and others that are nourished by wood and stones; but as long as we want ideas of those real constitutions of different sorts of animals, whereon these, and the like, qualities and powers depend, we must not hope to reach certainty in universal propositions concerning them. Those few ideas only, which have a discernible connexion with our nominal essence, or any part of it, can afford us such propositions. But these are so few, and of so little moment, that we may justly look on our certain general knowledge of substances, as almost none at all.

§ 16. *Wherein lies the general certainty of propositions.*—To conclude: general propositions, of what kind soever, are then only capable of certainty, when the terms used in them stand for such ideas, whose agreement or disagreement, as there expressed, is capable to be discovered by us. And we are then certain of their truth or falsehood, when we perceive the ideas the terms stand for, to agree or not agree, according as they are affirmed or denied one of another. Whence we may take notice, that general certainty is never to be found but in our ideas. Whenever we go to seek it elsewhere in experiment or observations without us, our knowledge goes not beyond particulars. It is the contemplation of our own abstract ideas, that alone is able to afford us general knowledge.

C H A P. VII.

OF MAXIMS.

§ 1. *They are self-evident.*—There are a sort of propositions, which under the name of maxims and axioms, have passed for principles of science; and because they are self-evident, have been supposed innate, although nobody (that I know) ever went about to shew the reason and foundation of their clearness or cogency. It may, however, be worth while to inquire into the reason of their evidence, and see whether it be peculiar to them alone, and also examine how far they influence and govern our other knowledge.

§ 2. *Wherein that self-evidence consists.*—Knowledge, as has been shewn, consists in the perception of the agreement or disagreement of ideas: now, where that agreement or disagreement is perceived immediately by itself, without the intervention or help of any other, there our

knowledge is self-evident. This will appear to be so to any one, who will but consider any of those propositions, which, without any proof, he assents to at first sight; for in all of them he will find, that the reason of his assent, is from that agreement or disagreement which the mind, by an immediate comparing them, finds in those ideas answering the affirmation or negation in the proposition.

§ 3. *Self-evidence, not peculiar to received axioms.*—This being so, in the next place let us consider, whether this self-evidence be peculiar only to those propositions, which commonly pass under the name of maxims, and have the dignity of axioms allowed them. And here it is plain, that several other truths, not allowed to be axioms, partake equally with them in this self-evidence. This we shall see, if we go over these several sorts of agreement or disagreement of ideas, which I have above-mentioned, viz. identity, relation, co-existence, and real existence; which will discover to us, that not only those few propositions, which have had the credit of maxims, are self-evident, but a great many, even almost an infinite number, of other propositions are such.

§ 4. *First, as to identity and diversity, all propositions are equally self-evident.*—For, *First*, the immediate perception of the agreement or disagreement of identity, being founded in the mind's having distinct ideas, this affords us as many self-evident propositions, as we have distinct ideas. Every one that has any knowledge at all, has, as the foundation of it, various and distinct ideas; and it is the first act of the mind (without which, it can never be capable of any knowledge) to know every one of its ideas by itself, and distinguish it from others. Every one finds in himself, that he knows the ideas he has; that he knows also, when any one is in his understanding, and what it is; and that when more than one are there, he knows them distinctly and confusedly one from another. Which always being so (it being impossible but that he should perceive what he perceives), he can never be in doubt when any idea is in his mind, that it is there, and is that idea it is; and that two distinct ideas, when they are in his mind, are there, and are not one and the same idea. So that all such affirmations and negations, are made without any possibility of doubt, uncertainty, or hesitation, and must necessarily be assented to, as soon as understood; that is, as soon as we have in our minds, determined ideas, which the terms in the proposition stand for. And, therefore, whenever the mind with attention considers any proposition, so as to perceive the two ideas signified by the terms, and affirmed or denied one of another, to be the same or different, it is presently and infallibly certain of the truth of such a proposition; and this equally, whether these propositions be in terms standing for more general ideas, for such as are less so, v. g. whether the general idea of being, be affirmed of itself, as in this proposition, "whatsoever is, is;" or a more particular idea be affirmed of itself, as a man is a man, or whatsoever is white, is white. Or whether the idea of being, in general, be denied of not being, which is the only (if I may so call it) idea different from it, as in this other proposition, "It is impossible for the same thing to be, and not to be;" or any idea of any particular being be denied of another different from it; as a man is not a horse; red is not blue. The difference of the ideas, as

soon as the terms are understood, makes the truth of the proposition presently visible, and that with an equal certainty and easiness in the less, as well as the more, general propositions, and all for the same reason, viz. because the mind perceives in any ideas that it has, the same ideas to be the same with itself; and two different ideas to be different, and not the same. And this it is equally certain of, whether these ideas be more or less general, abstract, and comprehensive. It is not therefore alone to these two general propositions, "Whatsoever is, is;" and "It is impossible for the same thing to be, and not to be;" that this sort of self-evidence belongs to any peculiar right. The perception of being, or not being, belongs no more to these vague ideas, signified by the terms whatsoever and thing, than it does to any other ideas. These two general maxims, amounting to no more, in short, but this, that the same is the same, and same is not different, are truths known in more particular instances, as well as in these general maxims, and known also in particular instances, before these general maxims are ever thought on, and draw all their force from the discernment of the mind employed about particular ideas. There is nothing more visible, than that the mind, without the help of any proof or reflection on either of these general propositions, perceives so clearly, and knows so certainly, that "the idea of white is the idea of white, and not the idea of blue;" and that "the idea of white, when it is in the mind, is there, and is not absent;" that the consideration of these axioms can add nothing to the evidence or certainty of its knowledge. Just so it is (as every one may experiment in himself) in all the ideas a man has in his mind; he knows each to be itself, and not to be another; and to be in his mind, and not away, when it is there, with a certainty that cannot be greater; and, therefore, the truth of no general proposition can be known with a greater certainty, nor add any thing to this. So that in respect of identity, our intuitive knowledge reaches as far as our ideas. And we are capable of making as many self-evident propositions, as we have names for distinct ideas. And I appeal to every one's own mind, whether this proposition, "A circle, is a circle," be not as self-evident a proposition, as that consisting of more general terms, "Whatsoever is, is;" and again, whether this proposition, "Blue is not red," be not a proposition that the mind can no more doubt of, as soon as it understands the words, than it does of that axiom, "It is impossible for the same thing to be, and not to be;" and so of all the like.

§ 5. *Secondly, in co-existence, we have few self-evident propositions.*—*Secondly,* As to co-existence, or such necessary connexion between two ideas, that in the subject where one of them is supposed, there the other must certainly be also: of such agreement or disagreement as this, the mind has an immediate perception but in very few of them; and therefore in this sort we have but very little intuitive knowledge. Nor are there to be found very many propositions that are self-evident, though some there are; v. g. the idea of filling a place equal to the contents of its superficies, being annexed to our idea of body, I think it is a self-evident proposition, "that two bodies cannot be in the same place."

§ 6. *Thirdly, in other relations we may have.*—*Thirdly,* As to the relation of modes, mathematicians have framed many axioms concerning

that one relation of equality. As, "Equals taken from equals, the remainder will be equal;" which, with the rest of that kind, however they are received from maxims by the mathematicians, and are unquestionable truths; yet, I think, that any one who considers them, will not find that they have a clearer self-evidence than these, that "One and one are equal to two;" that "If you take from the five fingers of one hand, two, and from the five fingers of the other hand, two, the remaining numbers will be equal." These, and a thousand other such propositions, may be found in numbers, which, at the very first hearing, force the assent, and carry with them an equal, if not greater, clearness, than those mathematical axioms.

§ 7. *Fourthly, concerning real existence, we have none.—Fourthly,* As to real existence, since that has no connexion with any other of our ideas, but that of ourselves, and of a first being, we have in that, concerning the real existence of all other beings, not so much as demonstrative, much less a self-evident, knowledge: and, therefore, concerning those there are no maxims.

§ 8. *Those axioms do not much influence our other knowledge.—*In the next place, let us consider what influence these received maxims have upon the other parts of our knowledge. The rules established in the schools, that all reasonings are *ex præcognitis et præconcessis*, seem to lay the foundation of all other knowledge in these maxims, and to suppose them to be *præcognita*; whereby, I think, are meant these two things; *First*, That these axioms are those truths that are first known to the mind. And, *Secondly*, That upon them the other parts of our knowledge depend.

§ 9. *Because they are not the truths we first knew.—First*, That they are not the truths first known to the mind, is evident to experience, as we have shewn in another place, b. 1. c. 2. Who perceives not, that a child certainly knows that a stranger is not its mother; that its sucking bottle is not the rod, long before he knows that "it is impossible for the same thing to be, and not to be?" And how many truths are there about numbers, which it is obvious to observe, that the mind is perfectly acquainted with, and fully convinced of, before it ever thought on these general maxims, to which mathematicians, in their arguings, do sometimes refer them? Whereof the reason is very plain; for that which makes the mind assent to such propositions, being nothing else but the perception it has of the agreement or disagreement of its ideas, according as it finds them affirmed or denied one of another, in words it understands; and every idea being known to be what it is, and every two distinct ideas being known not to be the same, it must necessarily follow, that such self-evident truths must be first known, which consist of ideas that are first in the mind; and the ideas first in the mind, it is evident, are those of particular things, from whence, by slow degrees, the understanding proceeds to some few general ones; which being taken from the ordinary and familiar objects of sense, are settled in the mind, with general names to them. Thus particular ideas are first received and distinguished, and so knowledge got about them; and next to them, the less general or specific, which are next to particular; for abstract ideas are not so obvious or easy to children, or the yet un-

exercised mind, as particular ones. If they seem so to grown men, it is only because by constant and familiar use they are made so; for when we nicely reflect upon them, we shall find, that general ideas are fictions and contrivances of the mind, that carry difficulty with them, and do not so easily offer themselves, as we are apt to imagine. For example, does it not require some pains and skill to form the general idea of a triangle (which is yet none of the most abstract, comprehensive, and difficult)? for it must be neither oblique nor rectangle, neither equilateral, equicrural, nor scalenon: but all and none of these at once. In effect, it is something imperfect, that cannot exist; an idea wherein some parts of several different and inconsistent ideas are put together. It is true, the mind, in this imperfect state, has need of such ideas, and makes all the haste to them it can, for the conveniency of communication, and enlargement of knowledge; to both which it is naturally very much inclined. But yet one has reason to suspect such ideas are marks of our imperfection; at least, this is enough to shew, that the most abstract and general ideas are not those that the mind is first and most easily acquainted with, nor such as its earliest knowledge is conversant about.

§ 10. *Because on them the other parts of our knowledge do not depend.*—*Secondly*, From what has been said, it plainly follows, that these magnified maxims are not the principles and foundations of all our other knowledge. For if there be a great many other truths, which have as much self-evidence as they, and a great many that we know before them, it is impossible they should be the principles from which we deduce all other truths. It is impossible to know that “one and two are equal to three,” but by virtue of this, or some such axiom, viz. “the whole is equal to all its parts taken together.” Many a one knows that “one and two are equal to three,” without having heard, or thought on that or any other axiom, by which it might be proved; and knows it as certainly as any other man knows that “the whole is equal to all its parts,” or any other maxim, and all from the same reason of self-evidence; the equality of those ideas being as visible and certain to him without that or any other axiom, as with it, in needing no proof to make it perceived. Nor after the knowledge, “that the whole is equal to all its parts,” does he know that “one and two are equal to three,” better, or more certainly, than he did before. For if there be any odds in those ideas, the whole and parts are more obscure, or at least more difficult to be settled in the mind, than those of “one, two, and three.” And, indeed, I think I may ask these men, who will needs have all knowledge, besides those general principles themselves, to depend on general, innate, and self-evident principles, What principle is requisite to prove, that “one and one are two,” that “two and two are four,” that “three times two are six?” Which being known without any proof, do evince, that either all knowledge does not depend on certain *præcognita*, or general maxims, called principles, or else that these are principles; and if these are to be counted principles, a great part of numeration will be so. To which, if we add all the self-evident propositions which may be made about all our distinct ideas, principles will be almost infinite, at least innumerable, which men arrive to the knowledge

of at different ages; and a great many of these innate principles, they never come to know all their lives. But whether they come in view of the mind earlier or later, this is true of them, that they are all known by their native evidence, are wholly independent, receive no light, nor are capable of any proof one from another; much less the more particular from the more general, or the more simple from the more compounded: the more simple, and less abstract, being the most familiar, and the easier and earlier apprehended. But whichever be the clearest ideas, the evidence and certainty of all such propositions is in this, that a man sees the same idea, to be the same idea, and infallibly perceives two different ideas to be different ideas. For when a man has in his understanding the ideas of one and of two, the idea of yellow, and the idea of blue, he cannot but certainly know, that the idea of one is the idea of one, and not the idea of two; and that the idea of yellow is the idea of yellow, and not the idea of blue. For a man cannot confound the ideas in his mind, which he has distinct; that would be to have them confused and distinct at the same time, which is a contradiction; and to have none distinct, is to have no use of our faculties, to have no knowledge at all. And therefore what idea soever is affirmed of itself, or whatsoever two entire distinct ideas are denied one of another, the mind cannot but assent to such a proposition, as infallibly true, as soon as it understands the terms without hesitation or need of proof, or regarding those made in more general terms, and called maxims.

§ 11. *What use these general maxims have.*—What shall we then say? Are these general maxims of no use? By no means; though perhaps their use is not that which it is commonly taken to be. But since doubting in the least of what hath been by some men ascribed to these maxims, may be apt to be cried out against, as overturning the foundations of all the sciences, it may be worth while to consider them, with respect to other parts of our knowledge, and examine more particularly to what purposes they serve, and to what not.

1. It is evident, from what has been already said, that they are of no use to prove or confirm less general self-evident propositions.

2. It is as plain that they are not, nor have been, the foundations whereon any science hath been built. There is, I know, a great deal of talk, propagated from scholastic men, of sciences and the maxims on which they are built; but it has been my ill luck, never to meet with any such sciences, much less any one built upon these two maxims, “what is, is;” and “it is impossible for the same thing to be, and not to be.” And I would be glad to be shewn where any such science, erected upon these, or any other, general axioms, is to be found; and should be obliged to any one who would lay before me the frame and system of any science so built on these, or any such like, maxims, that could not be shewn to stand as firm without any consideration of them. I ask, whether these general maxims have not the same use in the study of divinity, and in theological questions, that they have in other sciences? They serve here, too, to silence wranglers, and put an end to dispute. But I think that nobody will therefore say, that the Christian religion is built upon these maxims, or that the knowledge we have of it, is derived from these principles. It is from revelation we have received it, and

without revelation, these maxims have never been able to help us to it. When we find out an idea, by whose intervention we discover the connexion of two others, this is a revelation from God to us, by the voice of reason. For we then come to know a truth that we did not know before. When God declares any truth to us, this is a revelation to us by the voice of his Spirit, and we are advanced in our knowledge. But in neither of these do we receive our light or knowledge from maxims. But in the one, the things themselves afford it, and we see the truth in them by perceiving their agreement or disagreement. In the other, God himself affords it immediately to us, and we see the truth of what he says in his unerring veracity.

3. They are not of use to help men forward in the advancement of sciences, or new discoveries of yet unknown truths. Mr. Newton, in his never enough to be admired book, has demonstrated several propositions, which are so many new truths, before unknown to the world, and are farther advances in mathematical knowledge; but for the discovery of these, it was not the general maxims, "what is, is;" or "the whole is bigger than a part," or the like, that helped him. These were not the clues that led him into the discovery of the truth and certainty of those propositions. Nor was it by them that he got the knowledge of those demonstrations; but by finding out intermediate ideas, that shewed the agreement or disagreement of the ideas, as expressed in the propositions he demonstrated. This is the greatest exercise and improvement of human understanding in the enlarging of knowledge, and advancing the sciences; wherein they are far enough from receiving any help from the contemplation of these, or the like, magnified maxims. Would those who have this traditional admiration of these propositions, that they think no step can be made in knowledge without the support of an axiom, no stone laid in the building of the sciences without a general maxim, but distinguish between the method of acquiring knowledge, and of communicating; between the method of raising any science, and that of teaching it to others as far as it is advanced; they would see that those general maxims were not the foundations on which the first discoverers raised their admirable structures, nor the keys that unlocked and opened those secrets of knowledge. Though afterwards, when schools were erected, and sciences had their professors to teach what others had found out, they often made use of maxims, i. e. laid down certain propositions which were self-evident, or to be received for true; which being settled in the minds of their scholars, as unquestionable verities, they on occasion made use of, to convince them of truths in particular instances, that were not so familiar to their minds as those general axioms which had before been inculcated to them, and carefully settled in their minds. Though these particular instances, when well reflected on, are no less self-evident to the understanding, than the general maxims brought to confirm them; and it was in those particular instances that the first discoverer found the truth, without the help of the general maxims: and so may any one else do, who with attention considers them.

To come therefore to the use that is made of maxims.

1. They are of use, as has been observed, in the ordinary methods

of teaching sciences as far as they are advanced : but of little or none in advancing them farther.

2. They are of use in disputes, for the silencing of obstinate wranglers, and bringing those contests to some conclusion. Whether a need of them to that end, came not in, in the manner following, I crave leave to inquire. The schools having made disputation the touchstone of men's abilities, and the criterion of knowledge, adjudged victory to him that kept the field ; and he that had the last word, was concluded to have the better of the argument, if not of the cause. But because by this means there was like to be no decision between skilful combatants, whilst one never failed of a *medius terminus* to prove any proposition ; and the other could as constantly, without, or with a distinction, deny the major or minor : to prevent, as much as could be, running out of disputes into an endless train of syllogisms, certain general propositions, most of them indeed self-evident, were introduced into the schools ; which being such as all men allowed and agreed in, were looked on as general measures of truth, and served instead of principles (where the disputants had not laid down any other between them), beyond which there was no going, and which must not be receded from by either side. And thus these maxims getting the name of principles, beyond which men in dispute could not retreat, were by mistake taken to be originals and sources, from whence all knowledge began, and the foundations whereon the sciences were built : because when in their disputes they came to any of these, they stopped there, and went no farther, the matter was determined. But how much this is a mistake, hath been already shewn.

This method of the schools, which have been thought the fountains of knowledge, introduced, as I suppose, the like use of these maxims, into a great part of conversation out of the schools, to stop the mouths of cavillers ; whom any one is excused from arguing any longer with, when they deny these general self-evident principles received by all reasonable men, who have once thought of them ; but yet their use herein is but to put an end to wrangling. They in truth, when urged in such cases, teach nothing : that is already done by the intermediate ideas made use of in the debate, whose connexion may be seen without the help of those maxims, and so the truth known before the maxim is produced, and the argument brought to a first principle. Men would give off a wrong argument before it came to that, if in their disputes they proposed to themselves the finding and embracing of truth, and not a contest for victory. And thus maxims have their use to put a stop to their perverseness, whose ingenuity should have yielded sooner. But the method of these schools having allowed and encouraged men to oppose and resist evident truth, till they are baffled, i. e. till they are reduced to contradict themselves, or some established principle ; it is no wonder that they should not, in civil conversation, be ashamed of that which in the schools is counted a virtue and a glory ; obstinately to maintain that side of the question they have chosen, whether true or false, to the last extremity, even after conviction : a strange way to attain truth and knowledge ; and that which I think the rational part of mankind, not corrupted by education, could scarce believe should

ever be admitted amongst the lovers of truth, and students of religion or nature, or introduced into the seminaries of those who are to propagate the truths of religion or philosophy amongst the ignorant and unconvinced. How much such a way of learning is likely to turn young men's minds from the sincere search and love of truth; nay, and to make them doubt whether there is any such thing, or at least worth the adhering to; I shall not now inquire. This, I think, that bating those places which brought the peripatetic philosophy into their schools, where it continued many ages, without teaching the world any thing but the art of wrangling; these maxims were nowhere thought the foundations on which the sciences were built, nor the great helps to the advancement of knowledge.

As to these general maxims, therefore, they are, as I have said, of great use in disputes, to stop the mouths of wranglers; but not of much use to the discovery of unknown truths, or to help the mind in its search after knowledge: for whoever began to build his knowledge on this general proposition, "What is, is;" or, "It is impossible for the same thing to be, and not to be;" and from either of these, as from a principle of science, deduced a system of useful knowledge; wrong opinions often involving contradictions, one of these maxims, as a touch-stone, may serve well to shew whether they lead. But yet, however fit to lay open the absurdity or mistake of a man's reasoning or opinion, they are of very little use for enlightening the understanding; and it will not be found, that the mind receives much help from them in its progress in knowledge; which would be neither less, nor less certain, were these two general propositions never thought on. It is true, as I have said, they sometimes serve in argumentation to stop a wrangler's mouth, by shewing the absurdity of what he saith, and by exposing him to the shame of contradicting what all the world knows, and he himself cannot but own to be true. But it is one thing to shew a man that he is in an error, and another to put him in possession of truth; and I would fain know what truths these two propositions are able to teach, and by their influence make us know, which we did not know before, or could not know without them. Let us reason from them, as well as we can, they are only about identical predications; and influence, if any at all, none but such. Each particular proposition concerning identity or diversity, is as clearly and certainly known in itself, if attended to, as either of these general ones; only these general ones, as serving in all cases, are therefore more inculcated and insisted on. As to other less general maxims, many of them are no more than bare verbal propositions, and teach us nothing but the respect and import of names one to another. "The whole is equal to all its parts:" what real truth, I beseech you, does it teach us? What more is contained in that maxim, than what the signification of the word *totum*, or the whole, does of itself import? And he that knows that the word whole, stands for what is made up of all its parts, knows very little else, than that the whole is equal to all its parts. And upon the same ground, I think that this proposition, "A hill is higher than a valley," and several the like, may also pass for maxims. But yet masters of mathematics, when they would, as teachers of what they

know, initiate others in that science, do not, without reason, place this, and some other such maxims, at the entrance of their systems; that their scholars, having in the beginning perfectly acquainted their thoughts with these propositions, made in such general terms, may be used to make such reflections, and have these more general propositions, as formed rules and sayings, ready to apply to all particular cases. Not that if they be equally weighed, they are more clear and evident than the particular instances they are brought to confirm: but that being more familiar to the mind, the very naming them, is enough to satisfy the understanding. But this, I say, is more from our custom of using them, and the establishment they have got in our minds, by our often thinking of them, than from the different evidence of the things. But before custom has settled methods of thinking and reasoning in our minds, I am apt to imagine it is quite otherwise; and that the child, when part of his apple is taken away, knows it better in that particular instance, than by this general proposition, "The whole is equal to all its parts;" and that if one of these have need to be confirmed to him by the other, the general has more need to be let into his mind by the particular, than the particular by the general. For in particulars, our knowledge begins, and so spreads itself by degrees, to generals; though afterward the mind takes the quite contrary course, and having drawn its knowledge into as general propositions as it can, makes those familiar to its thoughts, and accustoms itself to have recourse to them, as to the standards of truth and falsehood. By which familiar use of them, as rules to measure the truth of other propositions, it comes in time to be thought, that more particular propositions have their truth and evidence from their conformity to these more general ones, which, in discourse and argumentation, are so frequently urged, and constantly admitted. And this I think to be the reason why among so many self-evident propositions, the most general only have had the title of maxims.

§ 12. *Maxims, if care be not taken in the use of words, may prove contradictions.*—One thing farther, I think, it may not be amiss to observe concerning these general maxims, that they are so far from improving or establishing our minds in true knowledge, that if our notions be wrong, loose, or unsteady, and we resign up our thoughts to the sound of words, rather than fix them on settled determined ideas of things; I say these general maxims will serve to confirm us in mistakes; and in such a way of use of words, which is most common, will serve to prove contradictions: v. g. he that with Des Cartes shall frame in his mind an idea of what he calls body, to be nothing but extension, may easily demonstrate, that there is no *vacuum*, i. e. no space void of body, by this maxim, "what is, is:" for the idea to which he annexes the name body, being bare extension, his knowledge that space cannot be without body, is certain: for he knows his own idea of extension clearly and distinctly, and knows that it is what it is, and not another idea, though it be called by these three names, extension, body, space. Which three words standing for one and the same idea, may, no doubt, with the same evidence and certainty, be affirmed one of another, as each of itself; and it is as certain, that whilst I use them all to stand for one and the same idea, this predication is as true and identical in its

signification, that space is body, as this predication is true and identical, that body is body, both in signification and sound.

§ 13. *Instance in vacuum.*—But if another should come, and make to himself another idea, different from Des Cartes's, of the thing, which yet, with Des Cartes, he calls by the same name body; and make his idea, which he expresses by the word body, to be of a thing that hath both extension and solidity together; he will as easily demonstrate, that there may be a *vacuum*, or space, without a body, as Des Cartes demonstrated the contrary. Because the idea to which he gives the name space, being barely the simple one of extension; and the idea to which he gives the name body, being the complex idea of extension and resistibility or solidity together in the same subject, these two ideas are not exactly one and the same, but in the understanding as distinct as the ideas of one and two, white and black, or as of corporiety and humanity, if I may use those barbarous terms: and therefore the predication of them in our minds, or in words standing for them, is not identical, but the negation of them one of another; viz. this proposition, "Extension or space is not body," is as true and evidently certain, as this maxim, "It is impossible for the same thing to be, and not to be," can make any proposition.

§ 14. *They prove not the existence of things without us.*—But yet, though both these propositions (as you see) may be equally demonstrated, viz. that there may be a vacuum, and that there cannot be a vacuum, by these two certain principles, viz. "What is, is," and "The same thing cannot be, and be;" yet neither of these principles will serve to prove to us, that any, or what, bodies do exist: for that we are left to our senses to discover to us as far as they can. Those universal and self-evident principles, being only our constant, clear, and distinct knowledge of our own ideas, more general or comprehensive, can assure us of nothing that passes without the mind; their certainty is founded only upon the knowledge we have of each idea by itself, and of its distinction from others; about which we cannot be mistaken whilst they are in our minds, though we may be, and often are, mistaken, when we retain the names without the ideas; or use them confusedly, sometimes for one, and sometimes for another, idea. In which cases, the force of these axioms, reaching only to the sound, and not the signification, of the words, serves only to lead us into confusion, mistake, and error. It is to shew men, that these maxims, however cried up for the great guards of truth, will not secure them from error in a careless loose use of their words, that I have made this remark. In all that is here suggested concerning their little use for the improvement of knowledge, or dangerous use in undetermined ideas, I have been far enough from saying or intending they should be laid aside, as some have been too forward to charge me. I affirm them to be truths, self-evident truths; and so cannot be laid aside. As far as their influence will reach, it is in vain to endeavour, nor will I attempt, to abridge it. But yet, without any injury to truth or knowledge, I may have reason to think their use is not answerable to the great stress which seems to be laid on them; and I may warn men not to make an ill use of them, for the confirming themselves in errors.

§ 15. *Their application dangerous about complex ideas.*—But let them be of what use they will in verbal propositions, they cannot discover or prove to us the least knowledge of the nature of substances, as they are found and exist without us, any farther than grounded on experience. And though the consequence of these two propositions, called principles, be very clear, and their use not dangerous or hurtful, in the probation of such things, wherein there is no need at all of them for proof, but such as are clear by themselves without them, viz. where our ideas are determined, and known by the names that stand for them: yet when these principles, viz. “what is, is;” and “it is impossible for the same thing to be, and not to be;” are made use of in the probation of propositions, wherein are words standing for complex ideas, v. g. man, horse, gold, virtue; there they are of infinite danger, and most commonly make men receive and retain falsehood for manifest truth, and uncertainty for demonstration: upon which follow error, obstinacy, and all the mischiefs that can happen from wrong reasoning. The reason whereof is not, that these principles are less true, or of less force in proving propositions made of terms standing for complex ideas, than where the propositions are about simple ideas. But because men mistake generally, thinking that where the same terms are preserved, the propositions are about the same things, though the ideas they stand for, are in truth different. Therefore these maxims are made use of to support those, which in sound and appearance are contradictory propositions; as is clear in the demonstrations above-mentioned about a *vacuum*. So that whilst men take words for things, as usually they do, these maxims may and do commonly serve to prove contradictory propositions: as shall yet be farther made manifest.

§ 16. *Instance in man.*—For instance: let man be that concerning which you would by these first principles demonstrate any thing, and we shall see, that so far as demonstration is by these principles, it is only verbal, and gives us no certain, universal, true proposition or knowledge, of any being existing without us. *First*, A child having framed the idea of a man, it is probable, that his idea is just like that picture which the painter makes of the visible appearances joined together; and such a complication of ideas together in his understanding, makes up the simple complex idea which he calls man, whereof white or flesh-colour in England, being one, the child can demonstrate to you, that a Negro is not a man, because white colour was one of the constant simple ideas of the complex idea he calls man: and therefore he can demonstrate by the principle, “It is impossible for the same thing to be, and not to be,” that a Negro is not a man; the foundation of his certainty being not that universal proposition, which, perhaps, he never heard nor thought of, but the clear distinct perception he hath of his own simple ideas of black and white, which he cannot be persuaded to take, nor can ever mistake one for another, whether he knows that maxim or no: and to this child, or any one who hath such an idea, which he calls man, can you never demonstrate that a man hath a soul, because his idea of man includes no such notion or idea in it. And therefore to him, the principle of “what is, is,” proves not this matter; but it depends upon

collection and observation, by which he is to make his complex idea called man.

§ 17. *Secondly*, Another that hath gone farther in framing and collecting the idea he calls man, and to the outward shape adds laughter and rational discourse, may demonstrate, that infants and changelings are no men, by this maxim, "it is impossible for the same thing to be, and not to be:" and I have discoursed with very rational men, who have actually denied that they are men.

§ 18. *Thirdly*, Perhaps another makes up the complex idea which he calls man, only out of the ideas of body in general, and the powers of language and reason, and leaves out the shape wholly: this man is able to demonstrate, that a man may have no hands, but be quadrupes, neither of those being included in his idea of man; and in whatever body or shape he found speech or reason joined, that was a man: because having a clear knowledge of such a complex idea, it is certain that "what is, is."

§ 19. *Little use of these maxims in proofs where we have clear and distinct ideas.*—So that, if rightly considered, I think we may say, that where our ideas are determined in our minds, and have annexed to them by us known and steady names under those settled determinations, there is little need, or no use at all, of these maxims, to prove the agreement or disagreement of any of them. He that cannot discern the truth or falsehood of such propositions, without the help of these, and the like, maxims, will not be helped by these maxims to do it: since he cannot be supposed to know the truth of these maxims themselves, without proof, if he cannot know the truth of others, without proof, which are as self-evident as these. Upon this ground it is, that intuitive knowledge neither requires nor admits any proof, one part of it more than another. He that will suppose it does, takes away the foundation of all knowledge and certainty: and he that needs any proof to make him certain, and give his assent to this proposition, "that two are equal to two," will also have need of a proof to make him admit, that "what is, is." He that needs a probation to convince him, that two are not three, that white is not black, that a triangle is not a circle, &c. or any other two determined distinct ideas, are not one and the same, will need also a demonstration to convince him, "that it is impossible for the same thing to be, and not to be."

§ 20. *Their use dangerous where our ideas are confused.*—And as these maxims are of little use where we have determined ideas, so they are, as I have shewn, of dangerous use where our ideas are not determined; and where we use words that are not annexed to determined ideas, but such as are of a loose and wandering signification, sometimes standing for one, and sometimes for another, idea: from which follows mistake and error, which these maxims (brought as proofs to establish propositions, wherein the terms stand for undetermined ideas) do by their authority confirm and rivet.

CHAP. VIII.

OF TRIFLING PROPOSITIONS.

§ 1. *Some propositions bring no increase to our knowledge.*—Whether the maxims treated of in the foregoing chapter, be of that use to real knowledge as is generally supposed, I leave to be considered. This, I think, may confidently be affirmed, that there are universal propositions, which, though they be certainly true, yet they add no light to our understandings, bring no increase to our knowledge. Such are,

§ 2. *As, first, identical propositions.*—*First*, All purely identical propositions. These obviously, and at first blush, appear to contain no instruction in them: for when we affirm the said term of itself, whether it be barely verbal, or whether it contains any clear and real idea, it shews us nothing but what we must certainly know before, whether such a proposition be either made by, or proposed to, us. Indeed, that most general one, “what is, is,” may serve sometimes to shew a man the absurdity he is guilty of, when by circumlocution or equivocal terms, he would, in particular instances, deny the same thing of itself; because nobody will so openly bid defiance to common sense, as to affirm visible and direct contradictions in plain words: or if he does, a man is excused if he breaks off any farther discourse with him. But yet, I think, I may say, that neither that received maxim, nor any other identical proposition, teaches us any thing: and though in such kind of propositions, this great and magnified maxim, boasted to be the foundation of demonstration, may be, and often is, made use of to confirm them; yet all it proves, amounts to no more than this, that the same word may with great certainty be affirmed of itself, without any doubt of the truth of any such proposition; and let me add also, without any real knowledge.

§ 3. For at this rate, any very ignorant person, who can but make a proposition, and knows what he means when he says, *Aye*, or *No*, may make a million of propositions, of whose truth he may be infallibly certain, and yet not know one thing in the world thereby; v. g. what is a soul, is a soul; or a soul is a soul; a spirit is a spirit; a fetiche is a fetiche, &c. These all being equivalent to this proposition, viz. “what is, is;” *i. e.* what hath existence, hath existence; or who hath a soul, hath a soul. What is this more than trifling with words? It is but like a monkey shifting his oyster from one hand to the other; and had he had but words, might, no doubt, have said, “Oyster in right hand is subject, and oyster in left hand is predicate:” and so might have made a self-evident proposition of oysters, *i. e.* oyster is oyster; and yet with all this, have not been one whit the wiser, or more knowing: and that way of handling the matter, would much at once have satisfied the monkey’s hunger, or a man’s understanding; and they would have improved in knowledge and bulk together.

I know there are some, who, because identical propositions are self-evident, shew a great concern for them, and think they do great service to philosophy by crying them up, as if in them was contained all know-

ledge, and the understanding were led into all truth by them only. I grant, as forwardly as any one, that they are all true and self-evident. I grant farther, that the foundation of all our knowledge lies in the faculty we have of perceiving the same idea to be the same, and of discerning it from those that are different, as I have shewn in the foregoing chapter. But how that vindicates the making use of identical propositions, for the improvement of knowledge, from the imputation of trifling, I do not see. Let any one repeat, as often as he pleases, that the will is the will, or lay what stress on it he thinks fit; of what use is this, and an infinite the like propositions, for the enlarging our knowledge? Let a man abound as much as the plenty of words which he has will permit, in such propositions as these; a "law is a law," and "obligation, is obligation;" "right is right," and "wrong is wrong;" will these and the like, ever help him to an acquaintance with ethics? Or instruct him or others in the knowledge of morality? Those who know not, nor perhaps ever will know, what is right, and what is wrong, nor the measures of them, can with as much assurance make, and infallibly know the truth of these, and all such propositions, as he that is best instructed in morality can do. But what advance do such propositions give in the knowledge of any thing necessary or useful for their conduct?

He would be thought to do little less than trifle, who, for the enlightening the understanding in any part of knowledge, should be busy with identical propositions, and insist on such maxims as these; substance is substance, and body is body; a vacuum is a vacuum, and a vortex is a vortex; a centaur is a centaur, and a chimera is a chimera, &c. For these, and all such, are equally true, equally certain, and equally self-evident. But yet they cannot but be counted trifling, when made use of as principles of instruction, and stress laid on them, as helps to knowledge; since they teach nothing but what every one, who is capable of discourse, knows without being told, viz. that the same term is the same term, and the same idea the same idea. And upon this account it was that I formerly did, and do still, think, the offering and inculcating such propositions, in order to give the understanding any new light or inlet into the knowledge of things, no better than trifling.

Instruction lies in something very different; and he that would enlarge his own or another's mind, to truths he does not yet know, must find out intermediate ideas, and then lay them in such order one by another, that the understanding may see the agreement or disagreement of those in question. Propositions that do this, are instructive: but they are far from such as affirm the same term of itself; which is no way to advance one's self or others in any sort of knowledge. It no more helps to that, than it would help any one in his learning to read, to have such propositions as these inculcated to him: an A is an A, and a B is a B; which a man may know as well as any schoolmaster, and yet never be able to read a word as long as he lives. Nor do these, or any such, identical propositions, help him one jot forwards in the skill of reading, let him make what use of them he can.

If those who blame my calling them trifling propositions, had but read, and been at the pains to understand, what I have above writ in very plain English, they could not but have seen that by identical propositions, I

mean only such wherein the same term importing the same idea, is affirmed of itself: which I take to be the proper signification of identical propositions; and concerning all such, I think I may continue safely to say, that to propose them as instructive, is no better than trifling. For no one who has the use of reason, can miss them, where it is necessary they should be taken notice of; nor doubt of their truth when he does take notice of them.

But if men will call propositions identical, wherein the same term is not affirmed of itself, whether they speak more properly than I, others must judge; this is certain, all that they say of propositions that are not identical, in my sense, concerns not me, nor what I have said; all that I have said relating to those propositions wherein the same term is affirmed of itself. And I would fain see an instance, wherein any such can be made use of, to the advantage and improvement of any one's knowledge. Instances of other kinds, whatever use may be made of them, concern not me, as not being such as I call identical.

§ 4. *Secondly, when a part of any complex idea is predicated of the whole.*—*Secondly*, Another sort of trifling propositions is, when a part of the complex idea is predicated of the name of the whole; a part of the definition of the word defined. Such are all propositions wherein the *genus* is predicated of the *species*, or more comprehensive of less comprehensive terms; for what information, what knowledge, carries this proposition in it, viz. "lead is a metal," to a man who knows the complex idea the name lead stands for? All the simple ideas that go to the complex one signified by the term metal, being nothing but what he before comprehended, and signified by the name lead. Indeed, to a man that knows the signification of the word metal, and not of the word lead, it is a shorter way to explain the signification of the word lead, by saying, it is a metal, which at once expresses several of its simple ideas, than to enumerate them one by one, telling him it is a body very heavy, fusible, and malleable.

§ 5. *As part of the definition of the term defined.*—A like trifling it is, to predicate any other part of the definition of the term defined, or to affirm any one of the simple ideas of a complex one, of the name of the whole complex idea: as "All gold is fusible." For fusibility being one of the simple ideas that goes to the making up the complex one the sound gold stands for, what can it be but playing with sounds, to affirm that of the name gold, which is comprehended in its received signification? It would be thought little better than ridiculous, to affirm gravely, as a truth of moment, that "gold is yellow;" and I see not how it is any jot more material to say, "It is fusible," unless that quality be left out of the complex idea of which the sound gold is the mark in ordinary speech. What instruction can it carry with it, to tell one that which he hath been told already, or he is supposed to know before? For I am supposed to know the signification of the word another uses to me, or else he is to tell me. And if I know that the name gold stands for this complex idea of body, yellow, heavy, fusible, malleable, it will not much instruct me to put it solemnly afterwards in a proposition, and gravely say, "All gold is fusible." Such propositions can only serve to shew the disingenuity of one, who will go from the definition of his

own terms, by reminding him sometimes of it ; but carry no knowledge with them, but of the signification of words, however certain they be.

§ 6. *Instance, man and palfry.*—Every man is an animal or living body, is as certain a proposition as can be ; but no more conducing to to the knowledge of things, than to say, “ A palfry is an ambling horse,” or a neighing ambling animal, both being only about the signification of words, and make me know but this : that body, sense, and motion, or power of sensation and moving, are three of those ideas that I always comprehend and signify by the word man ; and where they are not to be found together, the name man belongs not to that thing ; and so of the other, that body, sense, and a certain way of going, with a certain kind of voice, are some of those ideas which I always comprehend and signify by the word palfry ; and when they are not to be found together, the name palfry belongs not to that thing. It is just the same, and to the same purpose, when any term standing for any one or more of the simple ideas, that altogether make up that complex idea which is called man, is affirmed of the term man: v. g. suppose a Roman signified by the word *homo*, all these distinct ideas united in one subject, *corporeitas, sensibilitas, potentia se movendi, rationalitas, risibilitas*, he might, no doubt, with great certainty, universally affirm one, more, or all of these together of the word *homo*, but did no more than say, that the word *homo*, in his country, comprehended in its signification all these ideas. Much like a romance knight, who, by the word palfry, signified these ideas ; body of a certain figure, four-legged, with sense, motion, ambling, neighing, white, used to have a woman on his back : might with the same certainty, universally affirm also any or all of these of the word palfry ; but did thereby teach no more, but that the word palfry, in his, or romance language, stood for all these, and was not to be applied to any thing, where any of these were wanting. But he that shall tell me, that in whatever thing sense, motion, reason, and laughter were united, that thing had actually a notion of God, or would be cast into sleep by opium, made indeed an instructive proposition : because neither having the notion of God, nor being cast into sleep by opium, being contained in the idea signified by the word man, we are by such propositions taught something more than barely what the word man stands for ; and, therefore, the knowledge contained in it, is more than verbal.

§ 7. *For this teaches but the signification of words.*—Before a man makes any proposition, he is supposed to understand the terms he uses in it, or else he talks like a parrot, only making a noise by imitation, and framing certain sounds which he has learnt of others ; but not as a rational creature, using them for signs of ideas which he has in his mind. The hearer, also, is supposed to understand the terms as the speaker uses them, or else he talks jargon, and makes an unintelligible noise. And therefore he trifles with words, who makes such a proposition, which, when it is made, contains no more than one of the terms does, and which a man was supposed to know before, v. g. a triangle hath three sides, or saffron is yellow. And this is no farther tolerable than where a man goes to explain his terms, to one who is supposed, or de-

clares himself not to understand him; and then it teaches only the signification of that word, and the use of that sign.

§ 8. *But no real knowledge.*—We can know then the truth of two sorts of propositions, with perfect certainty: the one is, of those trifling propositions which have a certainty in them, but it is only a verbal certainty, but not instructive. And, *Secondly*, we can know the truth, and so may be certain in propositions, which affirm something of another, which is a necessary consequence of its precise complex idea, but not contained in it. As that the external angle of all triangles, is bigger than either of the opposite internal angles; which relation of the outward angle, to either of the opposite internal angles, making no part of the complex idea signified by the name triangle; this is a real truth, and conveys with it instructive real knowledge.

§ 9. *General propositions concerning substances, are often trifling.*—We having little or no knowledge of what combinations there be of simple ideas existing together in substances, but by our senses; we cannot make any universal certain propositions concerning them, any farther than our nominal essences lead us; which being to a very few and inconsiderable truths, in respect of those which depend on their real constitutions, the general propositions that are made about substances, if they are certain, are, for the most part, but trifling; and if they are instructive, are uncertain, and such as we can have no knowledge of their real truth, how much soever constant observation and analogy may assist our judgment in guessing. Hence it comes to pass, that one may often meet with very clear and coherent discourses that amount yet to nothing. For it is plain, that names of substantial beings, as well as others, as far as they have relative significations affixed to them, may, with great truth, be joined negatively and affirmatively in propositions, as their relative definitions make them fit to be so joined; and propositions consisting of such terms, may, with the same clearness, be deduced one from another, as those that convey the most real truths; and all this, without any knowledge of the nature or reality of things existing without us. By this method, one may make demonstrations and undoubted propositions in words, and yet thereby advance not one jot in the knowledge of the truth of things; v. g. he that having learned these following words, with their ordinary mutual relative acceptations annexed to them, v. g. substance, man, animal, form, soul, vegetative, sensitive, rational, may make several undoubted propositions about the soul, without knowing at all what the soul really is; and of this sort, a man may find an infinite number of propositions, reasonings, and conclusions, in books of metaphysics, school divinity, and some sort of natural philosophy; and, after all, know as little of God, spirits, or bodies, as he did before he set out.

§ 10. *And why.*—He that hath liberty to define, i. e. determine, the signification of his names of substances (as certainly every one does in effect, who makes them stand for his own ideas), and makes their significations at a venture, taking them from his own or other men's fancies, and not from an examination or inquiry into the nature of things themselves, may, with little trouble, demonstrate them one of another, according to those several respects, and mutual relations, he has given

them one to another ; wherein, however things agree or disagree in their own nature, he needs mind nothing but his own notions, with the names he hath bestowed upon them ; but thereby no more increases his own knowledge, than he does his riches, who taking a bag of counters, calls one in a certain place a pound ; another, in another place, a shilling ; and a third, in a third place, a penny : and so proceeding, may undoubtedly reckon right, and cast up a great sum, according to his counters so placed, and standing for more or less, as he pleases, without being one jot the richer, or without even knowing, how much a pound, shilling, or penny is, but only that one is contained in the other twenty times, and contains the other twelve ; which a man may also do in the signification of words, by making them in respect of one another more or less, or equally comprehensive.

§ 11. *Thirdly, using words variously, is trifling with them.*— Though yet concerning most words used in discourses, especially argumentative and controversial, there is this more to be complained of, which is the worst sort of trifling, and which sets us yet farther from the certainty of knowledge we hope to attain by them, or find in them, viz. that most writers are so far from instructing us in the nature and knowledge of things, that they use their words loosely and uncertainly, and do not, by using them constantly and steadily in the same significations, make plain and clear deductions of words one from another, and make their discourses coherent and clear (how little soever they were instructive), which were not difficult to do, did they not find it convenient to shelter their ignorance or obstinacy under the obscurity and perplexedness of their terms : to which, perhaps, inadvertency and ill custom do in many men much contribute.

§ 12. *Marks of verbal propositions.*— To conclude : barely verbal propositions may be known by these following marks :

First, predication in abstract.— *First,* All propositions, wherein two abstract terms are affirmed one of another, are barely about the signification of sounds. For since no abstract idea can be the same with any other but itself, when its abstract name is affirmed of any other term, it can signify no more but this, that it may, or ought to be called by that name ; or that these two names signify the same idea. Thus should any one say, that parsimony is frugality ; that gratitude is justice ; that this or that action is or is not temperate ; however specious these and the like propositions may at first sight seem, yet when we come to press them, and examine nicely what they contain, we shall find, that it all amounts to nothing but the signification of those terms.

§ 13. *Secondly, a part of the definition predicated of any term.*— *Secondly,* All propositions, wherein a part of the complex idea which any term stands for, is predicated of that term, are only verbal, v. g. to say that gold is a metal, or heavy. And thus all propositions, wherein more comprehensive words, called *genera*, are affirmed of subordinate, or less comprehensive, called *species* or individuals, are barely verbal.

When, by these two rules, we have examined the propositions that make up the discourses we ordinarily meet with, both in and out of books, we shall perhaps find, that a greater part of them, than is usually

suspected, are purely about the signification of words, and contain nothing in them, but the use and application of these signs.

This, I think, I may lay down for an infallible rule, that wherever the distinct idea any word stands for, is not known and considered, and something not contained in the idea, is not affirmed, or denied of it, there our thoughts stick wholly in sounds, and are able to attain no real truth or falsehood. This, perhaps, if well heeded, might save us a great deal of useless amusement and dispute; and very much shorten our trouble and wandering in the search of real and true knowledge.

CHAP. IX.

OF OUR KNOWLEDGE OF EXISTENCE.

§ 1. *General certain propositions concern not existence.*—Hitherto we have only considered the essences of things, which being only abstract ideas, and thereby removed in our thoughts from particular existence (that being the proper operation of the mind, in abstraction, to consider an idea under no other existence but what it has in the understanding), gives us no knowledge of real existence at all. Where, by the way, we may take notice that universal propositions, of whose truth or falsehood we can have certain knowledge, concern not existence; and farther, that all particular affirmations or negations that would not be certain, if they were made general, are only concerning existence; they declaring only the accidental union or separation of ideas in things existing, which, in their abstract natures, have no known necessary union or repugnancy.

§ 2. *A three-fold knowledge of existence.*—But, leaving the nature of propositions, and different ways of predication, to be considered more at large in another place, let us proceed now to inquire concerning our knowledge of the existence of things, and how we come by it. I say then, that we have the knowledge of our own existence, by intuition; of the existence of God, by demonstration; and of other things, by sensation.

§ 3. *Our knowledge of our own existence is intuitive.*—As for our own existence, we perceive it so plainly, and so certainly, that it neither needs, nor is capable of, any proof. For nothing can be more evident to us, than our own existence. I think, I reason, I feel pleasure and pain; can any of these be more evident to me, than my own existence? If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt of that. For if I know I feel pain, it is evident I have as certain perception of my own existence, as of the existence of the pain I feel: or if I know I doubt, I have as certain perception of the existence of the thing doubting, as of that thought which I call doubt. Experience then convinces us, that we have an intuitive knowledge of our own existence, and an internal infallible perception that we are. In every act of sensation, reasoning, or thinking, we are conscious to ourselves of our own being; and, in this matter, come not short of the highest degree of certainty.

CHAP. X.

OF OUR KNOWLEDGE OF THE EXISTENCE OF A GOD.

§ 1. *We are capable of knowing certainly that there is a God.*—Though God has given us no innate ideas of himself; though he has stamped no original characters in our minds, wherein we may read his being; yet having furnished us with those faculties our minds are endowed with, he hath not left himself without witness; since we have sense, perception, and reason, and cannot want a clear proof of him, as long as we carry ourselves about us. Nor can we justly complain of our ignorance in this great point since he has so plentifully provided us with the means to discover and know him, so far as is necessary, to the end of our being, and the great concernment of our happiness. But though this be the most obvious truth that reason discovers, and though its evidence be (if I mistake not) equal to mathematical certainty; yet it requires thought and attention, and the mind must apply itself to a regular deduction of it from some part of our intuitive knowledge, or else we shall be as uncertain and ignorant of this as of other propositions, which are in themselves capable of clear demonstration. To shew, therefore, that we are capable of knowing, i. e. being certain that there is a God, and how we may come by this certainty, I think we need go no farther than ourselves, and that undoubted knowledge we have of our own existence.

§ 2. *Man knows that he himself is.*—I think it is beyond question, that man has a clear idea of his own being; he knows certainly that he exists, and that he is something. He that can doubt, whether he be any thing or no, I speak not to; no more than I would argue with pure nothing, or endeavour to convince non-entity, that it were something. If any one pretends to be so sceptical, as to deny his own existence (for really to doubt of it, is manifestly impossible), let him for me enjoy his beloved happiness of being nothing, until hunger, or some other pain convince him of the contrary. This then, I think, I may take for a truth, which every one's certain knowledge assures him of beyond the liberty of doubting, viz. that he is something that actually exists.

§ 3. *He knows also, that nothing cannot produce a being, therefore something eternal.*—In the next place, man knows by an intuitive certainty, that bare nothing can no more produce any real being, than it can be equal to two right angles. If a man knows not that non-entity, or the absence of all being, cannot be equal to two right angles, it is impossible he should know any demonstration in Euclid. If therefore we know there is some real being, and that non-entity cannot produce any real being, it is an evident demonstration, that from eternity there has been something; since what was not from eternity, had a beginning; and what had a beginning, must be produced by something else.

§ 4. *That eternal being must be most powerful.*—Next, it is evident, that what had its being and beginning from another, must also have all that which is in, and belongs to its being from another too. All the

powers it has must be owing to, and received from, the same source. This eternal source, then, of all being, must also be the source and original of all power; and so this eternal being must be also the most powerful.

§ 5. *And most knowing.*—Again, a man finds in himself perception and knowledge. We have then got one step farther; and we are certain now, that there is not only some being, but some knowing intelligent being, in the world.

There was a time then, when there was no knowing being, and when knowledge began to be; or else, there has been also a knowing being from eternity. If it be said, there was a time when no being had any knowledge, when that eternal being was void of all understanding; I reply, that then it was impossible there should ever have been any knowledge. It being as impossible that things wholly void of knowledge, and operating blindly, and without any perception, should produce a knowing being; as it is impossible, that a triangle should make itself three angles bigger than two right ones. For it is as repugnant to the idea of senseless matter, that it should put into itself sense, perception, and knowledge; as it is repugnant to the idea of a triangle, that it should put into itself greater angles than two right ones.

§ 6. *And therefore God.*—Thus from the consideration of ourselves, and what we infallibly find in our own constitutions, our reason leads us to the knowledge of this certain and evident truth, that there is an eternal, most powerful, and most knowing Being; which, whether any one will please to call God, it matters not. The thing is evident; and from this idea duly considered, will easily be deduced all those other attributes which we ought to ascribe to this eternal Being. If, nevertheless, any one should be found so senselessly arrogant, as to suppose man alone, knowing and wise, but yet the product of mere ignorance and chance; and that all the rest of the universe acted only by that blind hap-hazard; I shall leave with him that very rational and emphatical rebuke of Tully, 1. 2. de Leg. to be considered at his leisure: “What can be more sillily arrogant and misbecoming, than for a man to think that he has a mind and understanding in him, but yet in all the universe beside, there is no such thing? Or that those things, which with the utmost stretch of his reason he can scarce comprehend, should be moved and managed without any reason at all?” “Quid est enim verius, quam neminem esse oportere tam stulte arrogantem, ut in se mentem et rationem putet inesse, in cœlo mundoque non putet? Aut ea quæ vix summa ingenii ratione comprehendat, nulla ratione moveri putet?”

From what has been said, it is plain to me we have a more certain knowledge of the existence of a God, than of any thing our senses have not immediately discovered to us. Nay, I presume I may say that we may more certainly know that there is a God, than that there is any thing else without us. When I say we know, I mean there is such a knowledge within our reach, which we cannot miss, if we will but apply our minds to that, as we do to several other inquiries.

§ 7. *Our idea of a most perfect being, not the sole proof of a God.*—How far the idea of a most perfect being, which a man may frame

in his mind, does or does not prove the existence of a God, I will not here examine. For in the different make of men's tempers, and application of their thoughts, some arguments prevail more on one, and some on another, for the confirmation of the same truth. But yet, I think, this I may say, that it is an ill way of establishing this truth, and silencing Atheists, to lay the whole stress of so important a point as this, upon that sole foundation: and take some men's having that idea of God in their minds (for it is evident, some men have none, and some worse than none, and the most very different), for the only proof of a Deity; and out of an over-fondness of that darling invention, cashier, or at least endeavour to invalidate, all other arguments, and forbid us to hearken to those proofs, as being weak or fallacious, which our own existence, and the sensible parts of the universe, offer so clearly and cogently to our thoughts, that I deem it impossible for a considering man to withstand them: for I judge it as certain and clear a truth, as can any where be delivered, that "the invisible things of God are clearly seen from the creation of the world, being understood by the things that are made, even his eternal power and Godhead." Though our own being furnishes us, as I have shewn, with an evident and incontestable proof of a Deity; and I believe nobody can avoid the cogency of it; who will but as carefully attend to it, as to any other demonstration of so many parts; yet this being so fundamental a truth, and of that consequence that all religion and genuine morality depend thereon, I doubt not but I shall be forgiven by my reader, if I go over some parts of this argument again, and enlarge a little more upon them.

§ 8. *Something from eternity.*—There is no truth more evident, than that something must be from eternity. I never yet heard of any one so unreasonable, or that could suppose so manifest a contradiction, as a time wherein there was perfectly nothing. This being of all absurdities the greatest, to imagine that pure nothing, the perfect negation and absence of all beings, should ever produce any real existence.

It being then unavoidable for all rational creatures to conclude that something has existed from eternity, let us next see what kind of thing that must be.

§ 9. *Two sort of beings, cogitative and incogitative.*—There are but two sorts of beings in the world, that man knows or conceives.

First, Such as are purely material, without sense, perception, or thought, as the clippings of our beards, and parings of our nails.

Secondly, Sensible, thinking, perceiving beings, such as we find ourselves to be; which, if you please, we will hereafter call cogitative and incogitative beings; which to our present purpose, if for nothing else, are perhaps better terms than material and immaterial.

§ 10. *Incogitative being cannot produce a cogitative.*—If then there must be something eternal, let us see what sort of being it must be. And so that, it is very obvious to reason, that it must necessarily be a cogitative being. For it is as impossible to conceive that ever bare incogitative matter should produce a thinking intelligent being, as that nothing should of itself produce matter. Let us suppose any parcel of matter eternal, great or small, we shall find it, in itself, able to produce nothing. For example, let us suppose the matter of the next pebble

we meet with, eternal, closely united, and the parts firmly at rest together; if there were no other being in the world, must it not eternally remain so, a dead, inactive lump? Is it possible to conceive it can add motion to itself, being purely matter, or produce any thing? Matter then, by its own strength, cannot produce in itself so much as motion: the motion it has, must also be from eternity, or else be produced, and added to matter by some other being more powerful than matter: matter, as is evident, having not power to produce motion in itself. But let us suppose motion eternal too; yet matter, incogitative matter and motion, whatever changes it might produce of figure and bulk, could never produce thought. Knowledge will still be as far beyond the power of motion and matter to produce, as matter is beyond the power of nothing, or non-entity to produce. And I appeal to every one's own thoughts, whether he cannot as easily conceive matter produced by nothing, as thought to be produced by pure matter, when before there was no such thing as thought, or an intelligent being existing? Divide matter into as minute parts as you will (which we are apt to imagine a sort of spiritualizing, or making a thinking thing of it), vary the figure and motion of it as much as you please; a globe, cube, cone, prism, cylinder, &c. whose diameters are but 1000000th part of a gry,* will operate no otherwise upon other bodies of proportionable bulk, than those of an inch or foot diameter? and you may as rationally expect to produce sense, thought, and knowledge, by putting together, in a certain figure and motion, gross particles of matter, as by those that are the very minutest, that do any where exist. They knock, impel, and resist one another, just as the greater do, and that is all they can do. So that if we will suppose nothing first, or eternal, matter can never begin to be: if we suppose bare matter without motion, eternal motion can never begin to be: if we suppose only matter and motion first, or eternal, thought can never begin to be. For it is impossible to conceive that matter, either with or without motion, could have originally in, and from, itself, sense, perception, and knowledge, as is evident from hence, that then sense, perception, and knowledge, must be a property eternally inseparable from matter, and every particle of it. Not to add, that though our general or specific conception of matter makes us speak of it as one thing, yet really all matter is not one individual thing, neither is there any such thing existing as one material being, or one single body, that we know or can conceive. And therefore if matter were the eternal first cogitative Being, there would not be one eternal infinite cogitative Being, but an infinite number of eternal finite cogitative beings, independent one of another, of limited force, and distinct thoughts, which could never produce that order, harmony, and beauty, which are to be found in nature. Since, therefore, whatsoever is the first eternal being, must necessarily be cogitative; and whatsoever is first of all things, must necessarily contain in it, and actually have, at least, all the per-

* A gry is one-tenth of a line, a line one-tenth of an inch, an inch one-tenth of a philosophical foot, a philosophical foot one-third of a pendulum, whose diadroms, in the latitude of 45 degrees, are each equal to one second of time, or one-sixtieth of a minute. I have affectedly made use of this measure here, and the parts of it, under a decimal division, with names to them; because I think it would be of general convenience, that this should be the common measure, in the commonwealth of letters.

fections that can ever after exist : nor can it ever give to another any perfection that it hath not, either actually in itself, or at least in a higher degree : it necessarily follows, that the first eternal being cannot be matter.

§ 11. *Therefore there has been an eternal wisdom.*—If therefore it be evident, that something necessarily must exist from eternity, it is also as evident, that that something must necessarily be a cogitative Being : for it is as impossible, that incogitative matter should produce a cogitative Being, as that nothing, or the negation of all being, should produce a positive being or matter.

§ 12. Though this discovery of the necessary existence of an eternal mind, does sufficiently lead us into the knowledge of God, since it will hence follow, that all other knowing beings that have a beginning, must depend on him, and have no other ways of knowledge, or extent of power, than what he gives them ; and therefore if he made those, he made also the less excellent pieces of this universe, all inanimate beings, whereby his omniscience, power, and providence, will be established, and all his other attributes necessarily follow : yet to clear up this a little farther, we will see what doubts can be raised against it.

§ 13. *Whether material or no.*—*First*, Perhaps it will be said, that though it be as clear as demonstration can make it, that there must be an eternal Being, and that Being must also be knowing ; yet it does not follow, but that thinking Being may also be material. Let it be so ; it equally still follows, that there is a God ; for if there be an eternal, omniscient, omnipotent Being, it is certain that there is a God, whether you imagine that Being to be material or no. But herein, I suppose, lies the danger and deceit of that supposition : there being no way to avoid the demonstration, that there is an eternal knowing Being, men, devoted to matter, would willingly have it granted, that this knowing Being is material ; and then letting slide out of their minds, or the discourse, the demonstration whereby an eternal knowing Being was proved necessarily to exist, would argue all to be matter, and so deny a God, that is, an eternal cogitative Being ; whereby they are so far from establishing, that they destroy, their own hypothesis. For if there can be, in their opinion, eternal matter, without any eternal cogitative Being, they manifestly separate matter and thinking, and suppose no necessary connexion of the one with the other ; and so establish the necessity of an eternal spirit, but not of matter, since it has been proved already, that an eternal cogitative being is unavoidably to be granted. Now, if thinking and matter may be separated, the eternal existence of matter will not follow from the eternal existence of a cogitative Being, and they suppose it to no purpose.

§ 14. *Not material, first, because every particle of matter is not cogitative.*—But now let us see how they can satisfy themselves or others, that this eternal thinking Being is material.

First, I would ask them, whether they imagine that all matter, every particle of matter, thinks ? This, I suppose, they will scarce say, since then there would be as many eternal thinking beings, as there are particles of matter, and so an infinity of gods. And yet, if they will not allow matter as matter, that is, every particle of matter to be as well

cogitative as extended, they will have as hard a task to make out to their own reasons, a cogitative being out of incogitative particles, as an extended being out of unextended parts, if I may so speak.

§ 15. *Secondly, one particle alone of matter, cannot be cogitative.*—*Secondly*, If all matter does not think, I next ask, whether it be only one atom that does so? This has as many absurdities as the other; for then this atom of matter must be alone eternal or not. If this alone be eternal, then this alone, by its powerful thought or will, made all the rest of matter. And so we have the creation of matter by a powerful thought, which is that the materialists stick at: for if they suppose one single thinking atom to have produced all the rest of matter, they cannot ascribe that pre-eminency to it upon any other account, than that of its thinking; the only supposed difference. But allow it to be by some other way, which is above our conception, it must be still creation, and these men must give up their great maxim, *Ex nihilo nil fit*. If it be said, that all the rest of matter is equally eternal, as that thinking atom, it will be to say any thing at pleasure, though ever so absurd: for to suppose all matter eternal, and yet one small particle in knowledge and power infinitely above all the rest, is without any the least appearance of reason to frame any hypothesis. Every particle of matter, as matter, is capable of all the same figures and motions of any other; and I challenge any one, in his thoughts, to add any thing else to one above another.

§ 16. *Thirdly, a system of incogitative matter, cannot be cogitative.*—*Thirdly*, If then neither one peculiar atom alone can be this eternal thinking Being, nor all matter, as matter, i. e. every particle of matter can be it, it only remains, that it is some certain system of matter duly put together, that is this thinking eternal Being. This is that which, I imagine, is that notion which men are aptest to have of God; who would have him a material Being, as most readily suggested to them, by the ordinary conceit they have of themselves, and other men, which they take to be material thinking beings. But this imagination, however more natural, is no less absurd than the other: for to suppose the eternal thinking Being, to be nothing else but a composition of particles of matter, each whereof is cogitative, is to ascribe all the wisdom and knowledge of that eternal Being only to the juxta-position of parts; than which, nothing can be more absurd. For unthinking particles of matter, however put together, can have nothing thereby added to them, but a new relation of position, which it is impossible should give thought and knowledge to them.

§ 17. *Whether in motion, or at rest.*—But farther, this corporeal system either has all its parts at rest, or it is a certain motion of the parts wherein its thinking consists. If it be perfectly at rest, it is but one lump, and so can have no privileges above one atom.

If it be the motion of its parts on which its thinking depends, all the thoughts there, must be unavoidably accidental and limited, since all the particles that by motion cause thought, being each of them in itself without any thought, cannot regulate its own motions, much less be regulated by the thought of the whole, since that thought is not the cause of motion (for then it must be antecedent to it, and so without it), but

the consequence of it, whereby freedom, power, choice, and all rational and wise thinking or acting, will be quite taken away: so that such a thinking being will be no better, nor wiser, than pure blind matter, since to resolve all into the accidental unguided motions of blind matter, or into thought depending on unguided motions of blind matter, is the same thing; not to mention the narrowness of such thoughts and knowledge that must depend on the motion of such parts. But there needs no enumeration of any more absurdities and impossibilities in this hypothesis (however full of them it be), than that before-mentioned; since let this thinking system be all, or a part of, the matter of the universe, it is impossible that any one particle should either know its own, or the motion of any other, particle, or the whole know the motion of every particle: and so regulate its own thoughts or motions, or indeed have any thought resulting from such motion.

§ 18. *Matter not co-eternal with an eternal mind.*—Others would have matter to be eternal, notwithstanding that they allow an eternal, cogitative, immaterial Being. This, though it take not away the being of a God, yet since it denies one and the first great piece of his workmanship, the creation, let us consider it a little. Matter must be allowed eternal; why? because you cannot conceive how it can be made out of nothing; why do you not also think yourself eternal? You will answer, perhaps, because about twenty or forty years since, you began to be. But if I ask you what that you is, which began then to be? you can scarce tell me. The matter whereof you are made, began not then to be; for if it did, then it is not eternal; but it began to be put together in such a fashion and frame as makes up your body; but yet that frame of particles is not you, it makes not that thinking thing you are (for I have now to do with one, who allows an eternal, immaterial, thinking Being, but would have unthinking matter eternal too); therefore when did that thinking thing begin to be? If it did never begin to be, then have you always been a thinking thing from eternity; the absurdity whereof I need not confute, till I meet with one who is so void of understanding as to own it. If, therefore, you can allow a thinking thing to be made out of nothing (as all things that are not eternal must be), why also can you not allow it possible for a material Being to be made out of nothing, by an equal power, but that you have the experience of the one in view, and not of the other? Though, when well considered, creation of a spirit will be found to require no less power than the creation of matter. Nay, possibly, if we would emancipate ourselves from vulgar notions, and raise our thoughts as far as they would reach, to a closer contemplation of things, we might be able to aim at some dim and seeming conception how matter might at first be made, and begin to exist, by the power of that eternal first Being; but to give beginning and being to a spirit, would be found a more inconceivable effect of omnipotent power. But this being what would perhaps lead us too far from the notions on which the philosophy now in the world is built, it would not be pardonable to deviate so far from them, or to inquire so far as grammar itself would authorize, if the common settled opinion opposes it; especially in this place, where the received doctrine serves well enough to our present purpose, and leaves this past doubt,

that the creation or beginning of any one substance out of nothing, being once admitted, the creation of all other, but the Creator himself, may, with the same ease, be supposed.

§ 19. But you will say, is it not impossible to admit of the making anything out of nothing, since we cannot possibly conceive it? I answer, No; 1. Because it is not reasonable to deny the power of an infinite Being, because we cannot comprehend its operations. We do not deny other effects upon this ground, because we cannot possibly conceive the manner of their production. We cannot conceive how any thing but impulse of body can move body; and yet that is not a reason sufficient to make us deny it possible, against the constant experience we have of it in ourselves, in all our voluntary motions, which are produced in us only by the free action or thought of our own minds; and are not, nor can be, the effects of the impulse or determination of the motion of blind matter, in or upon our bodies; for then it could not be in our power or choice to alter it. For example: my right hand writes, whilst my left hand is still; what causes rest in one, and motion in the other? Nothing but my will, a thought of my mind; my thought only changing, the right hand rests, and the left hand moves. This is matter of fact, which cannot be denied: explain this, and make it intelligible, and then the next step will be to understand creation: for the giving a new determination to the motion of the animal spirits (which some make use of to explain voluntary motion), clears not the difficulty one jot: to alter the determination of motion, being in this case no easier nor less than to give motion itself; since the new determination given to the animal spirits, must be either immediately by thought, or by some other body put in their way by thought, which was not in their way before, and so must owe its motion to thought; either of which leaves voluntary motion as unintelligible as it was before. In the mean time, it is an over-valuing ourselves, to reduce all to the narrow measure of our capacities; and to conclude all things impossible to be done, whose manner of doing exceeds our comprehension. This is to make our comprehension infinite, or God finite, when what he can do, is limited to what we can conceive of it. If you do not understand the operations of your own finite mind, that thinking thing within you, do not deem it strange that you cannot comprehend the operations of that eternal infinite mind, who made and governs all things, and whom the heaven of heavens cannot contain.

CHAP. XI.

OF OUR KNOWLEDGE OF THE EXISTENCE OF OTHER THINGS.

§ 1. *It is to be had only by sensation.*—The knowledge of our own being, we have by intuition. The existence of a God, reason clearly makes known to us, as has been shewn.

The knowledge of the existence of any other thing, we can have only by sensation: for there being no necessary connexion of real existence, with any idea a man hath in his memory, nor of any other existence but that of God, with the existence of any particular man; no particular

man can know the existence of any other being, but only when by actual operating upon him, it makes itself perceived by him. For the having the idea of any thing in our mind, no more proves the existence of that thing, than the picture of a man evidences his being in the world, or the visions of a dream make thereby a true history.

§ 2. *Instance, whiteness of this paper.*—It is therefore the actual receiving of ideas from without, that gives us notice of the existence of other things, and makes us know, that something doth exist at that time without us, which causes that idea in us, though perhaps we neither know nor consider how it does it; for it takes not from the certainty of our senses, and the ideas we receive by them, that we know not the manner wherein they are produced; v. g. whilst I write this, I have, by the paper affecting my eyes, that idea produced in my mind, which, whatever object causes, I call white; by which I know that that quality or accident (i. e. whose appearance before my eyes always causes that idea) doth really exist, and hath a being without me. And of this the greatest assurance I can possibly have, and to which my faculties can attain, is the testimony of my eyes, which are the proper and sole judges of this thing, whose testimony I have reason to rely on, as so certain, that I can no more doubt, whilst I write this, that I see white and black, and that something really exists that causes that sensation in me, than that I write or move my hand; which is a certainty as great as human nature is capable of, concerning the existence of any thing, but a man's self alone, and of God.

§ 3. *This, though not so certain as demonstration, yet may be called knowledge, and proves the existence of things without us.*—The notice we have by our senses, of the existing of things without us, though it be not altogether so certain as our intuitive knowledge, or the deductions of our reason, employed about the clear abstract ideas of our own minds; yet it is an assurance that deserves the name of knowledge. If we persuade ourselves, that our faculties act and inform us right concerning the existence of those objects that affect them, it cannot pass for an ill-grounded confidence; for I think nobody can, in earnest, be so sceptical, as to be uncertain of the existence of those things which he sees and feels. At least, he that can doubt so far (whatever he may have with his own thoughts), will never have any controversy with me; since he can never be sure I say any thing contrary to his own opinion. As to myself, I think God has given me assurance enough of the existence of things without me; since by their different application, I can produce in myself both pleasure and pain, which is one great concernment of my present state. This is certain, the confidence that our faculties do not herein deceive us, is the greatest assurance we are capable of, concerning the existence of material beings. For we cannot act any thing, but by our faculties: nor talk of knowledge itself, but by the helps of those faculties which are fitted to apprehend even what knowledge is. But besides the assurance we have from our senses themselves, that they do not err in the information they give us of the existence of things without us, when they are affected by them, we are farther confirmed in this assurance, by other concurrent reasons.

§ 4. *First, because we cannot have them but by the inlet of the*

senses.—*First*, It is plain those perceptions are produced in us by exterior causes affecting our senses; because those that want the organs of any sense, never can have the ideas belonging to that sense produced in their minds. This is too evident to be doubted; and therefore we cannot but be assured, that they come in by the organs of that sense, and no other way. The organs themselves, it is plain, do not produce them; for then the eyes of a man in the dark, would produce colours, and his nose smell roses in the winter: but we see nobody gets the relish of a pine-apple, till he goes to the Indies, where it is, and tastes it.

§ 5. *Secondly, because an idea from actual sensation and another from memory are very distinct perceptions.*—*Secondly*, Because sometimes I find, that I cannot avoid the having those ideas produced in my mind: for though when my eyes are shut, or windows fast, I can at pleasure recal to my mind the ideas of light, or the sun, which former sensations had lodged in my memory; so I can at pleasure lay by that idea, and take into my view that of the smell of a rose, or taste of sugar. But if I turn my eyes at noon towards the sun, I cannot avoid the ideas which the light or the sun then produces in me. So that there is a manifest difference between the ideas laid up in my memory (over which, if they were there only, I should have constantly the same power to dispose of them, and lay them by at pleasure), and those which force themselves upon me, and I cannot avoid having. And therefore it must needs be some exterior cause, and the brisk acting of some objects without me, whose efficacy I cannot resist, that produces those ideas in my mind, whether I will or no. Besides, there is nobody who doth not perceive the difference in himself, between contemplating the sun, as he hath the idea of it in his memory, and actually looking upon it: of which two his perception is so distinct, that few of his ideas are more distinguishable one from another: and therefore he hath certain knowledge, that they are not both memory, or the actions of his mind, and fancies only within him; but that actual seeing hath a cause without.

§ 6. *Thirdly, pleasure or pain, which accompanies actual sensation, accompanies not the returning of those ideas without the external objects.*—*Thirdly*, Add to this, that many of those ideas are produced in us with pain, which afterward we remember without the least offence. Thus the pain of heat or cold, when the idea of it is revived in our minds, gives us no disturbance; which, when felt, was very troublesome, and is again, when actually repeated; which is occasioned by the disorder the external object causes in our bodies, when applied to it. And we remember the pains of hunger, thirst, or the head-ach, without any pain at all; which would either never disturb us, or else constantly do it, as often as we thought of it, were there nothing more than ideas floating in our minds, and appearances entertaining our fancies, without the real existence of things affecting us from abroad. The same may be said of pleasure, accompanying several actual sensations; and though mathematical demonstrations depend not upon sense, yet the examining them by diagrams, gives great credit to the evidence of our sight, and seems to give it a certainty approaching to that of demonstration itself. For it would be very strange, that a man should allow it for an undeniable truth, that two angles of a figure, which he measures by lines

and angles of a diagram, should be bigger one than the other; and yet doubt of the existence of those lines and angles, which by looking on, he makes use of to measure that by.

§ 7. *Fourthly, our senses assist one another's testimony of the existence of outward things.*—*Fourthly,* Our senses, in many cases, bear witness to the truth of each other's report, concerning the existence of sensible things without us. He that sees a fire, may, if he doubt whether it be any thing more than a bare fancy, feel it too; and be convinced, by putting his hand in it. Which certainly could never be put into such exquisite pain by a bare idea or phantom, unless that the pain be a fancy too; which yet he cannot, when the burn is well, by raising the idea of it, bring upon himself again.

Thus I see whilst I write this, I can change the appearance of the paper; and by designing the letters, tell before-hand, what new idea it shall exhibit the very next moment, by barely drawing my pen over it; which will neither appear (let me fancy as much as I will), if my hand stand still; or though I move my pen, if my eyes be shut; nor when those characters are once made on the paper, can I choose afterward but see them as they are; that is, have the ideas of such letters as I have made. Whence it is manifest, that they are not barely the sport and play of my own imagination, when I find that the characters that were made at the pleasure of my own thought, do not obey them; nor yet can cease to be, whenever I shall fancy it, but continue to affect the senses constantly and regularly, according to the figures I made them. To which if we will add, that the sight of those shall, from another man, draw such sounds as I before-hand design they shall stand for, there will be little reason left to doubt that those words I write do really exist without me, when they cause a long series of regular sounds to affect my ears, which could not be the effect of my imagination, nor could my memory retain them in that order.

§ 8. *This certainty is as great as our condition needs.*—But yet, if after all this, any one will be so sceptical as to distrust his senses, and to affirm, that all we see and hear, feel and taste, think and do, during our whole being, is but the series and deluding appearances of a long dream, whereof there is no reality, and therefore will question the existence of all things, or our knowledge of any thing; I must desire him to consider, that if all be a dream, that he doth but dream that he makes the question; and so it is not much matter that a waking man should answer him. But yet, if he pleases, he may dream that I make him this answer, That the certainty of things existing in *rerum natura*, when we have the testimony of our senses for it, is not only as great as our frame can attain to, but as our condition needs. For our faculties being suited not to the full extent of being, nor to a perfect, clear, comprehensive knowledge of things, free from all doubt and scruple, but to the preservation of us, in whom they are, and accommodated to the use of life; they serve to our purpose well enough, if they will but give us certain notice of those things which are convenient or inconvenient to us. For he that sees a candle burning, and hath experimented the force of its flame, by putting his finger in it, will little doubt that this is something existing without him, which does him harm, and puts him to

great pain; which is assurance enough, when no man requires greater certainty to govern his actions by, than what is as certain as his actions themselves. And if our dreamer pleases to try whether the glowing heat of a glass furnace, be barely a wandering imagination in a drowsy man's fancy, by putting his hand into it, he may, perhaps be awakened into a certainty greater than he could wish, that it is something more than bare imagination. So that this evidence is as great as we can desire, being as certain to us as our pleasure or pain, *i. e.* happiness or misery: beyond which we have no concernment, either of knowing or being. Such an assurance of the existence of things without us, is sufficient, to direct us in the attaining the good, and avoiding the evil, which is caused by them; which is the important concernment we have of being made acquainted with them.

§ 9. *But reaches no farther than actual sensation.*—In fine, then, when our senses do actually convey into our understandings any idea, we cannot but be satisfied that there doth something at that time really exist without us, which doth affect our senses, and by them give notice of itself to our apprehensive faculties, and actually produce that idea which we then perceive; and we cannot so far distrust their testimony, as to doubt that such collections of simple ideas, as we have observed by our senses to be united together, do really exist together. But this knowledge extends as far as the present testimony of our senses, employed about particular objects, that do then affect them, and no farther. For if I saw such a collection of simple ideas, as is wont to be called man, existing together one minute since, and am now alone, I cannot be certain that the same man exists now, since there is no necessary connexion of his existence a minute since, with his existence now. By a thousand ways he may cease to be, since I had the testimony of my senses for his existence. And if I cannot be certain that the man I saw last to-day, is now in being, I can less be certain that he is so, who hath been longer removed from my senses, and I have not seen since yesterday, or since the last year; and much less can I be certain of the existence of men that I never saw. And, therefore, though it be highly probable that millions of men do now exist, yet whilst I am alone writing this, I have not that certainty of it, which we strictly call knowledge; though the great likelihood of it puts me past doubt, and it be reasonable for me to do several things upon the confidence that there are men (and men also of my acquaintance, with whom I have to do) now in the world: but this is but probability, not knowledge.

§ 10. *Folly to expect demonstration in every thing.*—Whereby yet we may observe how foolish and vain a thing it is for a man of a narrow knowledge, who having reason given him to judge of the different evidence and probability of things, and to be swayed accordingly; how vain, I say, it is to expect demonstration and certainty in things not capable of it, and refuse assent to very rational propositions, and act contrary to very plain and clear truths, because they cannot be made out so evident, as to surmount every the least (I will not say reason, but) pre-
tence of doubting. He that in the ordinary affairs of life, would admit of nothing but direct plain demonstration, would be sure of nothing in this world, but of perishing quickly. The wholesomeness of his meat

or drink, would not give him reason to venture on it: and I would fain know what it is he could do upon such grounds as were capable of no doubt, no objection.

§ 11. *Past existence is known by memory.*—As when our senses are actually employed about any object, we do know that it does exist: so by our memory, we may be assured, that heretofore things that affected our senses have existed. And thus we have knowledge of the past existence of several things, whereof our senses having informed us, our memories still retain the ideas: and of this we are past all doubt, so long as we remember well. But this knowledge also reaches no farther than our senses have formerly assured us. Thus seeing water at this instant, it is an unquestionable truth to me, that water doth exist: and remembering that I saw it yesterday, it will also be always true; and as long as my memory retains it, always an undoubted proposition to me, that water did exist on the 10th of July, 1688; as it will also be equally true, that a number of very fine colours did exist, which, at the same time, I saw upon a bubble of that water: but being now quite out of the sight both of the water and bubbles too, it is no more certainly known to me, that the water doth now exist, than that the bubbles or colours therein do so; it being no more necessary that water should exist to-day, because it existed yesterday, than that the colours or bubbles exist to-day, because they existed yesterday; though it be exceedingly much more probable, because water hath been observed to continue long in existence, but bubbles, and the colours on them, quickly cease to be.

§ 12. *The existence of spirits not knowable.*—What ideas we have of spirits, and how we come by them, I have already shewn. But though we have those ideas in our minds, and know we have them there, the having the ideas of spirits does not make us know that any such things do exist without us, or that there are any finite spirits, or any other spiritual beings, but the eternal God. We have ground from revelation, and several other reasons, to believe with assurance, that there are such creatures; but our senses not being able to discover them, we want the means of knowing their particular existences. For we can no more know that there are finite spirits really existing, by the idea we have of such beings in our minds, than by the ideas any one has of fairies, or centaurs, he can come to know that things answering those ideas do really exist.

And therefore concerning the existence of finite spirits, as well as several other things, we must content ourselves with the evidence of faith; but universal certain propositions concerning this matter, are beyond our reach. For however true it may be, v. g. that all the intelligent spirits that God ever created, do still exist; yet it can never make a part of our certain knowledge. These and the like propositions, we may assent to, as highly probable; but are not, I fear, in this state, capable of knowing. We are not then to put others upon demonstrating, nor ourselves upon search of universal certainty in all those matters wherein we are not capable of any other knowledge, but what our senses give us in this or that particular.

§ 13. *Particular propositions concerning existence, are knowable.*—

By which it appears, that there are two sorts of propositions. 1. There is one sort of propositions concerning the existence of any thing answerable to such an idea; as having the idea of an elephant, phoenix, motion, or an angel, in my mind, the first and natural inquiry is, whether such a thing does any where exist? And this knowledge is only of particulars. No existence of any thing without us, but only of God, can certainly be known farther than our senses inform us. 2. There is another sort of propositions, wherein is expressed the agreement or disagreement of our abstract ideas, and their dependence on one another. Such propositions may be universal or certain. So having the idea of God and myself, of fear and obedience, I cannot but be sure that God is to be feared and obeyed by me: and this proposition will be certain concerning man in general, if I have made an abstract idea of such a species, whereof I am one particular. But yet this proposition, how certain soever, that men ought to fear and obey God, proves not to me the existence of men in the world, but will be true of all such creatures, whenever they do exist: which certainty of such general propositions, depends on the agreement or disagreement to be discovered in those abstract ideas.

§ 14. *And general propositions concerning abstract ideas.*—In the former case, our knowledge is the consequence of the existence of things producing ideas in our minds by our senses: in the latter, knowledge is the consequence of the ideas (be they what they will) that are in our minds producing their general certain propositions. Many of these are called *æternæ veritates*, and all of them indeed are so; not from being written all or any of them in the minds of all men, or that they were any of them propositions in one's mind, till he, having got the abstract ideas, joined or separated them by affirmation or negation. But wheresoever we can suppose such a creature as man is, endowed with such faculties, and thereby furnished with such ideas, as we have, we must conclude, he must needs, when he applies his thoughts to the consideration of his ideas, know the truth of certain propositions, that will arise from the agreement or disagreement which he will perceive in his own ideas. Such propositions are therefore called eternal truths, not because they are eternal propositions actually formed, and antecedent to the understanding, that at any time makes them; nor because they are imprinted on the mind from any patterns that are any where out of the mind, and existed before: but because being once made about abstract ideas, so as to be true, they will, whenever they can be supposed to be made again at any time past or to come, by a mind having those ideas, always actually be true. For names being supposed to stand perpetually for the same ideas; and the same ideas having immutably the same habitudes one to another; propositions concerning any abstract ideas, that are once true, must needs be eternal verities.

CHAP. XII.

OF THE IMPROVEMENT OF OUR KNOWLEDGE.

§ 1. *Knowledge is not from maxims.*—It having been the common received opinion among men of letters, that maxims were the foundation of all knowledge; and that the sciences were each of them built upon certain *præcognita*, from whence the understanding was to take its rise, and by which it was to conduct itself, in its inquiries into the matters belonging to that science; the beaten road of the schools has been to lay down in the beginning, one or more general propositions, as foundations whereon to build the knowledge that was to be had of that subject. These doctrines thus laid down for foundations of any science, were called principles, as the beginnings from which we must set out, and look no farther backwards in our inquiries, as we have already observed.

§ 2. *The occasion of that opinion.*—One thing which might probably give an occasion to this way of proceeding in other sciences, was (as I suppose) the good success it seemed to have in mathematics, wherein men being observed to attain a great certainty of knowledge, these sciences came by pre-eminence to be called *Μαθήματα* and *Μάθησις*, learning, or things learned, thoroughly learned, as having, of all others, the greatest certainty, clearness, and evidence, in them.

§ 3. *But from the comparing clear and distinct ideas.*—But if any one will consider, he will (I guess) find that the great advancement and certainty of real knowledge, which men arrived to in these sciences, was not owing to the influence of these principles, nor derived from any peculiar advantage they received from two or three general maxims laid down in the beginning; but from the clear, distinct, complete ideas their thoughts were employed about, and the relation of equality and excess so clear between some of them, that they had an intuitive knowledge, and by that, a way to discover it in others, and this without the help of those maxims. For I ask, is it not possible for a young lad to know that his whole body is bigger than his little finger, but by virtue of this axiom, “that the whole is bigger than a part;” nor be assured of it, until he has learned that maxim? Or cannot a country wench know, that having received a shilling from one that owes her three, and a shilling also from another that owes her three, the remaining debts in each of their hands are equal? Cannot she know this, I say, unless she fetch the certainty of it from this maxim, that “if you take equals from equals, the remainder will be equals?” a maxim which possibly she never heard or thought of. I desire any one to consider, from what has been elsewhere said, which is known first and clearest by most people, the particular instance, or the general rule; and which it is that gives life and birth to the other. These general rules are but the comparing our more general and abstract ideas, which are the workmanship of the mind made, and names given to them, for the easier dispatch in its reasonings, and drawing into comprehensive terms, and short rules, its various and multiplied observations. But knowledge began in the

mind, and was founded on particulars; though afterward, perhaps, no notice be taken thereof; it being natural for the mind (forward still to enlarge its knowledge) most attentively to lay up those general notions, and make the proper use of them, which is to disburthen the memory of the cumbersome load of particulars. For I desire it may be considered what more certainty there is to a child, or any one, that his body, little finger and all, is bigger than his little finger alone, after you have given to his body the name whole, and to his little finger the name part, than he could have had before; or what new knowledge concerning his body, can these two relative terms give him, which he could not have without them? Could he not know that his body was bigger than his little finger, if his language were yet so imperfect, that he had no such relative terms as whole and part? I ask farther, when he has got these names, how is he more certain that his body is a whole, and his little finger a part, than he was, or might be, certain, before he learned those terms, that his body was bigger than his little finger? Any one may as reasonably doubt or deny, that his little finger is a part of his body, as that, it is less than his body. And he that can doubt whether it be less, will as certainly doubt whether it be a part. So that the maxim "the whole is bigger than a part," can never be made use of to prove the little finger is less than the body, but when it is useless, by being brought to convince one of a truth which he knows already. For he that does not certainly know that any parcel of matter, with another parcel of matter joined to it, is bigger than either of them alone, will never be able to know it by the help of those two relative terms, whole and part, make of them what maxim you please.

§ 4. *Dangerous to build upon precarious principles.*—But be it in the mathematics as it will, whether it be clearer, that taking an inch from a black line of two inches, and an inch from a red line of two inches, the remaining parts of the two lines will be equal; or that if you take equals from equals, the remainder will be equals; which, I say, of these two is the clearer and first known, I leave it to any one to determine, it not being material to my present occasion. That which I have here to do, is to inquire, whether if it be the readiest way to knowledge, to begin with general maxims, and build upon them, it be yet a safe way to take the principles, which are laid down in any other science, as unquestionable truths; and so receive them without examination, and adhere to them without suffering them to be doubted, because mathematicians have been so happy, or so fair, to use none but self-evident and undeniable? If this be so, I know not what may not pass for truth in morality, what may not be introduced and proved in natural philosophy.

Let that principle of some of the philosophers, that all is matter, and that there is nothing else, be received for certain and indubitable, and it will be easy to be seen by the writings of some that have revived it again in our days, what consequences it will lead us into. Let any one, with Polemo, take the world; or with the stoics, the æther, or the sun; or with Anaximenes, the air; to be a God; and what a divinity, religion, and worship, must we needs have! Nothing can be so dangerous as principles thus taken up without questioning or examination; especi-

ally if they be such as concern morality, which influence men's lives, and give a bias to all their actions. Who might not justly expect another kind of life in Aristippus, who placed happiness in bodily pleasure; and in Antisthenes, who made virtue sufficient to felicity? And he who, with Plato, shall place beatitude in the knowledge of God, will have his thoughts raised to other contemplations than those who look not beyond this spot of earth, and those perishing things which are to be had in it. He that, with Archelaus, shall lay it down as a principle, that right and wrong, honest and dishonest, are defined only by laws, and not by nature, will have other measures of moral rectitude and pravity, than those who take it for granted, that we are under obligations antecedent to all human constitutions.

§ 5. *This is no certain way to truth.*—If therefore those that pass for principles, are not certain (which we must have some way to know, that we may be able to distinguish them from those that are doubtful), but are only made so to us by our blind assent, we are liable to be misled by them; and instead of being guided into truth, we shall, by principles, be only confirmed in mistake and error.

§ 6. *But to compare clear complete ideas under steady names.*—But since the knowledge of the certainty of principles, as well as of all other truths, depends only upon the perception we have of the agreement or disagreement of our ideas, the way to improve our knowledge is not, I am sure, blindly, and with an implicit faith to receive and swallow principles; but is, I think, to get and fix in our minds clear, distinct, and complete ideas, as far as they are to be had, and annex to them proper and constant names. And thus, perhaps, without any other principles, but barely considering those ideas, and by comparing them one with another, finding their agreement or disagreement, and their several relations and habitudes, we shall get more true and clear knowledge by the conduct of this one rule, than by taking up principles, and thereby putting our minds into the disposal of others.

§ 7. *The true method of advancing knowledge, is by considering our abstract ideas.*—We must therefore, if we will proceed as reason advises, adapt our methods of inquiry to the nature of the ideas, we examine, and the truth we search after. General and certain truths are only founded in the habitudes and relations of abstract ideas. A sagacious and methodical application of our thoughts, for the finding out these relations, is the only way to discover all that can be put with truth and certainty concerning them, into general propositions. By what steps we are to proceed in these, is to be learned in the schools of the mathematicians, who, from very plain and easy beginnings, by gentle degrees, and a continued chain of reasonings, proceed to the discovery and demonstration of truths that appear at first sight beyond human capacity. The art of finding proofs, and the admirable methods they have invented for the singling out, and laying in order, those intermediate ideas that demonstratively shew the equality or inequality of unapplicable quantities, is that which has carried them so far, and produced such wonderful and unexpected discoveries: but whether something like this, in respect of other ideas, as well as those of magnitude, may not in time be found out, I will not determine. This, I think, I

may say, that if other ideas, that are the real as well as nominal essences of their species, were pursued in the way familiar to mathematicians, they would carry our thoughts farther, and with greater evidence and clearness, than possibly we are apt to imagine.

§ 8. *By which morality also may be made clearer.*—This gave me the confidence to advance that conjecture which I suggest, chap. 3. viz. “That morality is capable of demonstration, as well as mathematics.” For the ideas that ethics are conversant about, being all real essences, and such as, I imagine, have a discoverable connexion and agreement one with another; so far as we can find their habitudes and relations, so far we shall be possessed of certain, real, and general truths; and I doubt not, but if a right method were taken, a great part of morality might be made out with that clearness, that could leave, to a considering man, no more reason to doubt, than he could have to doubt of the truth of propositions in mathematics, which have been demonstrated to him.

§ 9. *But knowledge of bodies is to be improved only by experience.*—In our search after the knowledge of substances, our want of ideas, that are suitable to such a way of proceeding, obliges us to a quite different method. We advance not here, as in the other (where our abstract ideas are real, as well as nominal, essences), by contemplating our ideas, and considering their relations and correspondencies; that helps us very little, for the reasons that in another place we have at large set down. By which, I think, it is evident, that substances afford matter of very little general knowledge; and the bare contemplation of their abstract ideas, will carry us but a very little way in the search of truth and certainty. What then are we to do for the improvement of our knowledge in substantial beings? Here we are to take a quite contrary course; the want of ideas of their real essences, sends us from our own thoughts, to the things themselves, as they exist. Experience here must teach me what reason cannot; and it is by trying alone, that I can certainly know what other qualities co-exist with those of my complex idea, v. g. whether that yellow, heavy, fusible body, I call gold, be malleable or no? which experience (which way ever it prove in that particular body I examine) makes me not certain that it is so in all or any other yellow, heavy, fusible bodies, but that which I have tried. Because it is no consequence one way or the other, from my complex idea: the necessity of inconsistency of malleability hath no visible connexion with the combination of that colour, weight, and fusibility, in any body. What I have said here of the nominal essence of gold, supposed to consist of a body of such a determinate colour, weight, and fusibility, will hold true, if malleableness, fixedness, and solubility in *aqua regia*, be added to it. Our reasonings from these ideas will carry us but a little way in the certain discovery of the other properties in those masses of matter, wherein all these are to be found. Because the other properties of such bodies depending not on these, but on that unknown real essence, on which these also depend, we cannot by them discover the rest; we can go no farther than the simple ideas of our nominal essence will carry us, which is very little beyond themselves: and so afford us but very sparingly any certain universal, and useful

truths. For upon trial, having found that particular piece (and all others of that colour, weight, and fusibility, that I ever tried) malleable, that also makes now, perhaps, a part of my complex idea, part of my nominal essence, of gold; whereby, though I make my complex idea, to which I affix the name gold, to consist of more simple ideas than before; yet still it not containing the real essence of any species of bodies, it helps me not certainly to know (I say to know, perhaps it may to conjecture) the other remaining properties of that body, farther than they have a visible connexion with some or all of the simple ideas that make up my nominal essence. For example; I cannot be certain from this complex idea, whether gold be fixed or no; because, as before, there is no necessary connexion or inconsistency to be discovered betwixt a complex idea of a body yellow, heavy, fusible, malleable, betwixt these, I say, and fixedness; so that I may certainly know, that in whatsoever body these are found, there fixedness is sure to be. Here again, for assurance, I must apply myself to experience; as far as that reaches, I may have certain knowledge, but no farther.

§ 10. *This may procure us convenience, not science.*—I deny not but a man accustomed to rational and regular experiments, shall be able to see farther into the nature of bodies, and guess righter at their yet unknown properties, than one that is a stranger to them; but yet, as I have said, this is but judgment and opinion, not knowledge and certainty. This way of getting and improving our knowledge in substances only by experience and history, which is all that the weakness of our faculties in this state of mediocrity, which we are in in this world, can attain to, makes me suspect that natural philosophy is not capable of being made a science. We are able, I imagine, to reach very little general knowledge concerning the species of bodies, and their several properties. Experiments and historical observations we may have, from which we may draw advantages of ease and health, and thereby increase our stock of conveniences for this life; but beyond this, I fear our talents reach not, nor are our faculties, as I guess, able to advance.

§ 11. *We are fitted for moral knowledge and natural improvements.*—From whence it is obvious to conclude, that since our faculties are not fitted to penetrate into the internal fabric and real essences of bodies; but yet plainly discover to us the being of a God, and the knowledge of ourselves, enough to lead us into a full and clear discovery of our duty and great concernment; it will become us, as rational creatures, to employ those faculties we have, about what they are most adapted to, and follow the direction of nature, where it seems to point us out the way. For it is rational to conclude, that our proper employment lies in those inquiries, and in that sort of knowledge which is most suited to our natural capacities, and carries in it our greatest interest, i. e. the condition of our eternal estate. Hence I think I may conclude, that morality is the proper science and business of mankind in general (who are both concerned and fitted to search out their *summum bonum*), as several arts, conversant about several parts of nature, are the lot and private talent of particular men, for the common use of human life, and their own particular subsistence in this world. Of what consequence the discovery of one natural body and its properties may be to human life, the whole

great continent of America is a convincing instance ; whose ignorance in useful arts, and want of the greatest part of the conveniences of life, in a country that abounded with all sorts of natural plenty, I think may be attributed to their ignorance of what was to be found in a very ordinary despicable stone, I mean the mineral of iron. And whatever we think of our parts or improvements in this part of the world, where knowledge and plenty seem to vie with each other ; yet to any one that will seriously reflect on it, I suppose it will appear past doubt, that were the use of iron lost amongst us, we should in a few ages be unavoidably reduced to the wants and ignorance of the ancient savage Americans, whose natural endowments and provisions come no way short of those of the most flourishing and polite nations ; so that he who first made known the use of that contemptible mineral, may be truly styled the father of arts, and author of plenty.

§ 12. *But must beware of hypotheses, and wrong principles.*—I would not therefore be thought to disesteem or dissuade the study of nature. I readily agree, the contemplation of his works gives us occasion to admire, revere, and glorify their author : and if rightly directed, may be of greater benefit to mankind, than the monuments of exemplary charity that have, at so great charge, been raised by the founders of hospitals and alms-houses. He that first invented printing, discovered the use of the compass, or made public the virtue and right use of *kinkina*, did more for the propagation of knowledge, for the supply and increase of useful commodities, and saved more from the grave, than those who built colleges, work-houses, and hospitals. All that I would say, is, that we should not be too forwardly possessed with the opinion or expectation of knowledge, where it is not to be had, or by ways that will not attain to it : that we should not take doubtful systems to complete sciences ; nor unintelligible notions for scientific demonstrations. In the knowledge of bodies, we must be content to glean what we can from particular experiments ; since we cannot, from a discovery of their real essences, grasp at a time whole sheaves ; and in bundles comprehend the nature and properties of whole species together. Where our inquiry is concerning co-existence, or repugnancy to co-exist, which by contemplation of our ideas we cannot discover ; their experience, observation, and natural history, must give us by our senses, and by retail, an insight into corporeal substances. The knowledge of bodies we must get by our senses, warily employed in taking notice of their qualities and operations on one another ; and what we hope to know of separate spirits in this world, we must, I think, expect only from revelation. He that shall consider how little general maxims, precarious principles, and hypotheses laid down at pleasure, have promoted true knowledge, or helped to satisfy the inquiries of rational men after real improvements ; how little, I say, the setting out at that end has, for many ages together, advanced men's progress towards the knowledge of natural philosophy ; will think we have reason to thank those, who in this latter age have taken another course, and have trod out to us, though not an easier way to learned ignorance, yet a surer way to profitable knowledge.

§ 13. *The true use of hypotheses.*—Not that we may not, to explain

any phenomena of nature, make use of any probable hypothesis whatsoever. Hypotheses, if they are well made, are at least great helps to the memory, and often direct us to new discoveries. But my meaning is, that we should not take up any one too hastily (which the mind, that would always penetrate into the causes of things, and have principles to rest on, is very apt to do), till we have very well examined particulars, and made several experiments in that thing which we would explain by our hypotheses, and see whether it will agree to them all; whether our principles will carry us quite through, and not be as inconsistent with one phenomenon of nature, as they seem to accommodate and explain another. And at least that we take care that the name of principles deceive us not, nor impose upon us, by making us receive that for an unquestionable truth, which is really, at best, but a very doubtful conjecture; such as are most (I had almost said all) of the hypotheses in natural philosophy.

§ 14. *Clear and distinct ideas with settled names, and the finding of those which shew their agreement or disagreement, are the ways to enlarge our knowledge.*—But whether natural philosophy be capable of certainty or no, the ways to enlarge our knowledge, as far as we are capable, seem to me, in short, to be these two :

First, The first is to get and settle in our minds determined ideas of those things, whereof we have general or specific names; at least so many of them as we would consider and improve our knowledge in, or reason about. And if they be specific ideas of substances, we should endeavour also, to make them as complete as we can, whereby I mean, that we should put together as many simple ideas, as being constantly observed to co-exist, may perfectly determine the species; and each of those simple ideas, which are the ingredients of our complex ones, should be clear and distinct in our minds: for it being evident that our knowledge cannot exceed our ideas, as far as they are either imperfect, confused, or obscure, we cannot expect to have certain, perfect, or clear knowledge.

Secondly, The other is the art of finding out those intermediate ideas, which may shew us the agreement or repugnancy of other ideas, which cannot be immediately compared.

§ 15. *Mathematics an instance of it.*—That these two (and not the relying on maxims, and drawing consequences from some general propositions) are the right methods of improving our knowledge in the ideas of other modes, besides those of quantity, the consideration of mathematical knowledge will easily inform us. Where first we shall find, that he that has not a perfect and clear idea of those angles or figures of which he desires to know any thing, is utterly thereby incapable of any knowledge about them. Suppose but a man not to have a perfect exact idea of a right angle, a scalenum, or trapezium; and there is nothing more certain, than that he will in vain seek any demonstration about them. Farther it is evident, that it was not the influence of those maxims which are taken for principles in mathematics, that hath led the masters of that science into those wonderful discoveries they have made. Let a man of good parts know all the maxims generally made use of in mathematics ever so perfectly, and contemplate their

extent and consequences as much as he pleases, he will, by their assistance, I suppose, scarce ever come to know, that the square of the hypotenuse in a right-angled triangle, is equal to the squares of the two other sides. The knowledge that "the whole is equal to all its parts," and "if you take equals from equals, the remainder will be equal," &c. helped him not, I presume, to this demonstration: and a man may, I think, pore long enough on those axioms, without ever seeing one jot the more of mathematical truths. They have been discovered by the truths otherwise applied; the mind had other objects, other views before it, far different from those maxims, when it first got the knowledge of such kind of truths in mathematics, which men, well enough acquainted with those received axioms, but ignorant of their method who first made those demonstrations, can never sufficiently admire. And who knows what methods, to enlarge our knowledge in other parts of science, may hereafter be invented, answering that of algebra in mathematics, which so readily finds out the ideas of quantities to measure others by, whose equality or proportion we could otherwise very hardly, or perhaps never, come to know?

CHAP. XIII.

SOME FARTHER CONSIDERATIONS CONCERNING OUR KNOWLEDGE.

§ 1. *Our knowledge partly necessary, partly voluntary.*—Our knowledge, as in other things, so in this, has so great a conformity with our sight, that it is neither wholly necessary, nor wholly voluntary. If our knowledge were altogether necessary, all men's knowledge would not only be alike, but every man would know all that is knowable; and if it were wholly voluntary, some men so little regard or value it, that they would have extreme little, or none at all. Men that have senses, cannot choose but receive some ideas by them; and if they have memory, they cannot but retain some of them; and if they have any distinguishing faculty, cannot but perceive the agreement or disagreement of some of them one with another; as he that has eyes, if he will open them by day, cannot but see some objects, and perceive a difference in them. But though a man, with his eyes open in the light, cannot but see; yet there be certain objects, which he may choose whether he will turn his eyes to; there may be in his reach a book containing pictures and discourses capable to delight or instruct him, which yet he may never have the will to open, never take the pains to look into.

§ 2. *The application voluntary; but we know as things are, not as we please.*—There is also another thing in a man's power, and that is, though he turns his eyes sometimes towards an object, yet he may choose whether he will curiously survey it, and with an intent application endeavour to observe accurately all that is visible in it. But yet, what he does see, he cannot see otherwise than he does. It depends not on his will to see that black which appears yellow; nor to persuade himself,

that what actually scalds him, feels cold; the earth will not appear painted with flowers, nor the fields covered with verdure, whenever he has a mind to it: in the cold winter, he cannot help seeing it white and hoary, if he will look abroad. Just thus is it with our understanding; all that is voluntary in our knowledge, is the employing, or withholding, any of our faculties, from this or that sort of objects, and a more or less accurate survey of them; but they being employed, our will hath no power to determine the knowledge of the mind one way or other; that is done only by the objects themselves, as far as they are clearly discovered. And therefore, as far as men's senses are conversant about external objects, the mind cannot but receive those ideas which are presented by them, and be informed of the existence of things without; and so far as men's thoughts converse with their own determined ideas, they cannot but, in some measure, observe the agreement or disagreement that is to be found amongst some of them, which is so far knowledge: and if they have names for those ideas which they have thus considered, they must needs be assured of the truth of those propositions, which express that agreement or disagreement they perceive in them, and be undoubtedly convinced of those truths. For what a man sees, he cannot but see; and what he perceives, he cannot but know that he perceives.

§ 3. *Instance in numbers.*—Thus, he that has got the ideas of numbers, and hath taken the pains to compare one, two, and three, to six, cannot choose but know that they are equal. He that hath got the idea of a triangle, and found the ways to measure its angles, and their magnitudes, is certain that its three angles are equal to two right ones: and can as little doubt of that, as of this truth, that “it is impossible for the same thing to be, and not to be.”

In natural religion.—He also that hath the idea of an intelligent, but frail and weak, being, made by and depending on another, who is eternal, omnipotent, perfectly wise and good, will as certainly know that man is to honour, fear, and obey God, as that the sun shines when he sees it. For if he hath but the ideas of two such beings in his mind, and will turn his thoughts that way, and consider them, he will as certainly find, that the inferior, finite, and dependent, is under an obligation to obey the Supreme and Infinite, as he is certain to find, that three, four, and seven, are less than fifteen, if he will consider and compute those numbers; nor can he be surer in a clear morning that the sun is risen, if he will but open his eyes, and turn them that way. But yet these truths being ever so certain, ever so clear, he may be ignorant of either, or of all of them, who will never take the pains to employ his faculties as he should, to inform himself about them.

CHAP. XIV.

OF JUDGMENT.

§ 1. *Our knowledge being short, we want something else.*—The understanding faculties being given to man, not barely for speculation, but also for the conduct of his life, man would be at a great loss, if he

had nothing to direct him but what has the certainty of true knowledge. For that being very short and scanty, as we have seen, he would be often utterly in the dark, and in most of the actions of his life, perfectly at a stand, had he nothing to guide him in the absence of clear and certain knowledge. He that will not eat, till he has demonstration that it will nourish him; he that will not stir, till he infallibly knows the business he goes about will succeed; will have but little else to do, but to sit still and perish.

§ 2. *What use to be made of this twilight state.*—Therefore, as God has set some things in broad daylight, as he has given us some certain knowledge, though limited to a few things in comparison, probably, as a taste of what intellectual creatures are capable of, to excite in us a desire and endeavour after a better state; so, in the greatest part of our concernments, he has afforded us only the twilight, as I may so say, of probability, suitable, I presume, to that state of mediocrity and probationership he has been pleased to place us in here; wherein, to check our over-confidence and presumption, we might, by every day's experience, be made sensible of our short-sightedness, and liableness to error; the sense whereof might be a constant admonition to us, to spend the days of this our pilgrimage with industry and care, in the search and following of that way which might lead us to a state of greater perfection. It being highly rational to think, even were revelation silent in the case, that as men employ those talents God has given them here, they shall accordingly receive their rewards at the close of the day, when their sun shall set, and night shall put an end to their labours.

§ 3. *Judgment supplies the want of knowledge.*—The faculty which God has given man to supply the want of clear and certain knowledge, in cases where that cannot be had, is judgment: whereby the mind takes its ideas to agree or disagree; or, which is the same, any proposition to be true or false, without perceiving a demonstrative evidence in the proofs. The mind sometimes exercises this judgment out of necessity, where demonstrative proofs, and certain knowledge, are not to be had; and sometimes out of laziness, unskilfulness, or haste, even where demonstrative and certain proofs are to had. Men often stay not warily to examine the agreement or disagreement of two ideas, which they are desirous or concerned to know; but either incapable of such attention as is requisite in a long train of gradations, or impatient of delay, lightly cast their eyes on, or wholly pass by, the proofs; and so, without making out the demonstration, determine of the agreement or disagreement of two ideas, as it were, by a view of them as they are at a distance, and take it to be the one or the other, as seems most likely to them upon such a loose survey. This faculty of the mind, when it is exercised immediately about things, is called judgment; when about truths delivered in words, is most commonly called assent or dissent: which being the most usual way wherein the mind has occasion to employ this faculty, I shall, under these terms, treat of it as least liable in our language to equivocation.

§ 4. *Judgment is the presuming things to be so, without perceiving it.*—Thus the mind has two faculties conversant about truth and falsehood.

First, Knowledge, whereby it certainly perceives, and is undoubtedly satisfied of, the agreement or disagreement of any ideas.

Secondly, Judgment, which is the putting ideas together, or separating them from one another, in the mind, when their certain agreement or disagreement is not perceived, but presumed to be so; which is, as the word imports, taken to be so, before it certainly appears. And if it so unites or separates them, as in reality things are, it is right judgment.

CHAP. XV.

OF PROBABILITY.

§ 1. *Probability is the appearance of agreement upon fallible proofs.*—As demonstration is the shewing the agreement or disagreement of two ideas, by the intervention of one or more proofs, which have a constant, immutable, and visible connexion one with another; so probability is nothing but the appearance of such an agreement or disagreement, by the intervention of proofs, whose connexion is not constant and immutable, or at least is not perceived to be so, but is, or appears, for the most part to be so, and is enough to induce the mind to judge the proposition to be true or false, rather than the contrary. For example; in the demonstration of it, a man perceives the certain immutable connexion there is of equality between the three angles of a triangle, and those intermediate ones, which are made use of to shew their equality to two right ones; and so, by an intuitive knowledge of the agreement or disagreement of the intermediate ideas in each step of the progress, the whole series is continued with an evidence which clearly shews the agreement or disagreement of those three angles in equality to two right ones: and thus he has certain knowledge that it is so. But another man, who never took the pains to observe the demonstration, hearing a mathematician, a man of credit, affirm the three angles of a triangle to be equal to two right ones, assents to it, i. e. receives it for true. In which case, the foundation of his assent is the probability of the thing, the proof being such as for the most part carries truth with it: the man, on whose testimony he receives it, not being wont to affirm any thing contrary to, or besides, his knowledge, especially in matters of this kind. So that which causes his assent to this proposition, that the three angles of a triangle are equal to two right ones, that which makes him take these ideas to agree, without knowing them to do so, is the wonted veracity of the speaker in other cases, or his supposed veracity in this.

§ 2. *It is to supply the want of knowledge.*—Our knowledge, as has been shewn, being very narrow, and we not happy enough to find certain truth in every thing which we have occasion to consider, most of the propositions we think, reason, discourse, nay, act upon, are such as we cannot have undoubted knowledge of their truth; yet some of them border so near upon certainty, that we make no doubt at all about them, but assent to them as firmly, and act, according to that assent, as resolutely, as if they were infallibly demonstrated, and that our know-

ledge of them was perfect and certain. But there being degrees herein, from the very neighbourhood of certainty and demonstration, quite down to improbability and unlikeliness, even to the confines of impossibility; and also degrees of assent, from full assurance and confidence, quite down to conjecture, doubt, and distrust; I shall come now (having, as I think, found out the bounds of human knowledge and certainty), in the next place, to consider the several degrees and grounds of probability, and assent or faith.

§ 3. *Being that which makes us presume things to be true, before we know them to be so.*—Probability is likeliness to be true, the very notation of the word signifying such a proposition, for which there be arguments or proofs, to make it pass, or be received, for true. The entertainment the mind gives this sort of propositions, is called belief, assent, or opinion; which is the admitting or receiving any proposition for true, upon arguments or proofs that are found to persuade us to receive it as true, without certain knowledge that it is so. And herein lies the difference between probability and certainty, faith and knowledge, that in all the parts of knowledge there is intuition; each immediate idea, each step, has its visible and certain connexion; in belief, not so. That which makes me believe, is something extraneous to the thing I believe; something not evidently joined on both sides to, and so not manifestly shewing the agreement or disagreement of those ideas that are under consideration.

§ 4. *The grounds of probability are two; conformity with our own experience, or the testimony of others' experience.*—Probability, then, being to supply the defect of our knowledge, and to guide us where that fails, is always conversant about propositions whereof we have no certainty, but only some inducements to receive them for true. The grounds of it are, in short, these two following:

First, The conformity of any thing with our own knowledge, observation, and experience.

Secondly, The testimony of others, vouching their observation and experience. In the testimony of others, is to be considered, 1. The number. 2. The integrity. 3. The skill of the witnesses. 4. The design of the author, where it is a testimony out of a book cited. 5. The consistency of the parts and circumstances of the relation. 6. Contrary testimonies.

§ 5. *In this, all the arguments pro and con ought to be examined, before we come to a judgment.*—Probability wanting that intuitive evidence which infallibly determines the understanding, and produces certain knowledge, the mind, if it would proceed rationally, ought to examine all the grounds of probability, and see how they make more or less for or against any proposition, before it assents to, or dissents from, it; and upon a due balancing the whole, reject or receive it, with a more or less firm assent, proportionably to the preponderancy of the greater grounds of probability on one side or the other. For example:

If I myself see a man walk on the ice, it is past probability, it is knowledge: but if another tells me, he saw a man in England, in the midst of a sharp winter, walk upon water hardened with cold; this has so great conformity with what is usually observed to happen, that I

am disposed, by the nature of the thing itself, to assent to it, unless some manifest suspicion attend the relation of that matter of fact. But if the same thing be told to one born between the tropics, who never saw nor heard of any such thing before, there the whole probability relies on testimony: and as the relators are more in number, and of more credit, and have no interest to speak contrary to the truth; so that matter of fact is like to find more or less belief. Though to a man, whose experience has always been quite contrary, and has never heard of any thing like it, the most untainted credit of a witness will scarce be able to find belief. At it happened to a Dutch ambassador, who entertaining the King of Siam with the particularities of Holland, which he was inquisitive after, amongst other things, told him, that the water in his country would sometimes, in cold weather, be so hard, that men walked upon it, and that it would bear an elephant, if he were there. To which the king replied, "Hitherto I have believed the strange things you have told me, because I look upon you as a sober fair man; but now I am sure you lie."

§ 6. *They being capable of great variety.*—Upon these grounds depends the probability of any proposition: and as the conformity of our knowledge, as the certainty of observations, as the frequency and constancy of experience, and the number and credibility of testimonies, do more or less agree or disagree with it, so is any proposition in itself more or less probable. There is another, I confess, which, though by itself it be no true ground of probability, yet is often made use of for one, by which men most commonly regulate their assent, and upon which they pin their faith more than any thing else, and that is the opinion of others: though there cannot be a more dangerous thing to rely on, nor more likely to mislead one, since there is much more falsehood and error among men, than truth and knowledge. And if the opinions and persuasions of others, whom we know and think well of, be a ground of assent, men have reason to be Heathens in Japan, Mahometans in Turkey, Papists in Spain, Protestants in England, and Lutherans in Sweden. But of this wrong ground of assent, I shall have occasion to speak more at large in another place.

CHAP. XVI.

OF THE DEGREES OF ASSENT.

§ 1. *Our assent ought to be regulated by the grounds of probability.*—The grounds of probability we have laid down in the foregoing chapter; as they are the foundations on which our assent is built, so are they also the measure whereby its several degrees are, or ought to be, regulated: only we are to take notice, that whatever grounds of probability there may be, they yet operate no farther on the mind, which searches after truth, and endeavours to judge right, than they appear, at least in the first judgment or search that the mind makes. I confess, in the opinions men have, and firmly stick to, in the world, their assent is not always from an actual view of the reasons that at first prevailed with them; it being in many cases almost impossible, and in most very

hard, even for those who have very admirable memories, to retain all the proofs, which, upon a due examination, made them embrace that side of the question. It suffices that they have once, with care and fairness, sifted the matter as far as they could; and that they have searched into all the particulars that they could imagine, to give any light to the question, and with the best of their skill, cast up the account upon the whole evidence; and thus having once found on which side the probability appeared to them, after as full and exact an inquiry as they can make, they lay up the conclusion, in their memories, as a truth they have discovered; and for the future they remain satisfied with the testimony of their memories, that this is the opinion that, by the proofs they have once seen of it, deserves such a degree of their assent as they afford it.

§ 2. *These cannot always be actually in view, and then we must content ourselves with the remembrance that we once saw ground for such a degree of assent.*—This is all that the greatest part of men are capable of doing, in regulating their opinions and judgments, unless a man will exact of them, either to retain distinctly in their memories all the proofs concerning any probable truth, and that too in the same order, and regular deduction of consequences, in which they have formerly placed or seen them; which sometimes is enough to fill a large volume upon one single question: or else they must require a man, for every opinion that he embraces, every day to examine the proofs; both which are impossible. It is unavoidable, therefore, that the memory be relied on in the case, and that men be persuaded of several opinions, whereof the proofs are not actually in their thoughts; nay, which perhaps they are not able actually to recal. Without this the greatest part of men must be either very sceptics, or change every moment, and yield themselves up to whoever, having lately studied the question, offers them arguments; which, for want of memory, they are not able presently to answer.

§ 3. *The ill consequence of this, if our former judgments were not rightly made.*—I cannot but own, that men's sticking to their past judgment, and adhering firmly to conclusions formerly made, is often the cause of great obstinacy in error and mistake. But the fault is not that they rely on their memories for what they have before well judged, but because they judged before they had well examined. May we not find a great number (not to say the greatest part) of men, that think they have formed right judgments of several matters, and that for no other reason, but because they never thought otherwise? Who imagine themselves to have judged right, only because they never questioned, never examined, their own opinions? Which is indeed to think they judged right, because they never judged at all: and yet these, of all men, hold their opinions with the greatest stiffness; those being generally the most fierce and firm in their tenets, who have least examined them. What we once know, we are certain is so; and we may be secure that there are no latent proofs undiscovered, which may overturn our knowledge, or bring it in doubt. But in matters of probability, it is not in every case we can be sure that we have all the particulars before us, that any way concern the question; and that there is no evidence behind, and yet unseen, which may cast the probability on

the other side, and out-weigh all that at present seems to preponderate with us. Who almost is there that hath the leisure, patience, and means to collect together all the proofs concerning most of the opinions he has, so as safely to conclude, that he hath a clear and full view, and that there is no more to be alleged for his better information? and yet we are forced to determine ourselves on the one side or other. The conduct of our lives, and the management of our great concerns, will not bear delay; for those depend, for the most part, on the determination of our judgment in points wherein we are not capable of certain and demonstrative knowledge, and wherein it is necessary for us to embrace the one side or the other.

§ 4. *The right use of it, is mutual charity and forbearance.*—Since therefore it is unavoidable to the greatest part of men, if not all, to have several opinions, without certain and indubitable proofs of their truths; and it carries too great an imputation of ignorance, lightness, or folly, for men to quit and renounce their former tenets presently upon the offer of an argument which they cannot immediately answer, and shew the sufficiency of: it would, methinks, become all men to maintain peace, and the common offices of humanity and friendship, in the diversity of opinions, since we cannot reasonably expect that any one should readily and obsequiously quit his own opinion, and embrace ours, with a blind resignation to an authority which the understanding of man acknowledges not. For however it may often mistake, it can own no other guide but reason, nor blindly submit to the will and dictates of another. If he you would bring over to your sentiments, be one that examines before he assents, you must give him leave at his leisure to go over the account again, and recalling what is out of his mind, examine all the particulars, to see on which side the advantage lies; and if he will not think our arguments of weight enough to engage him anew in so much pains, it is but what we often do ourselves in the like case; and we should take it amiss, if others should prescribe to us what points we should study: and if he be one who takes his opinions upon trust, how can we imagine that he should so renounce those tenets, which time and custom have so settled in his mind, that he thinks them self-evident, and of an unquestionable certainty; or which he takes to be impressions he has received from God himself, or from men sent by him? How can we expect, I say, that opinions thus settled, should be given up to the arguments or authority of a stranger or adversary, especially if there be any suspicion of interest or design, as there never fails to be where men find themselves ill treated? We should do well to commiserate our mutual ignorance, and endeavour to remove it in all the gentle and fair ways of information, and not instantly treat others ill as obstinate and perverse, because they will not renounce their own, and receive our, opinions, or at least those we would force upon them, when it is more than probable that we are no less obstinate in not embracing some of theirs. For where is the man that has incontestable evidence of the truth of all that he holds, or of the falsehood of all he condemns; or can say, that he has examined to the bottom, all his own or other men's opinions? The necessity of believing, without knowledge, nay, often upon very slight grounds, in this fleeting

state of action and blindness we are in, should make us more busy and careful to inform ourselves, than constrain others; at least those who have not thoroughly examined to the bottom of all their own tenets, must confess they are unfit to prescribe to others, and are unreasonable in imposing that as truth on other men's belief, which they themselves have not searched into, nor weighed the arguments of probability on which they should receive or reject it. Those who have fairly and truly examined, and are thereby got past doubt in all the doctrines they profess and govern themselves by, would have a more just pretence to require others to follow them: but these are so few in number, and find so little reason to be magisterial in their opinions, that nothing insolent and imperious is to be expected from them; and there is reason to think, that if men were better instructed themselves, they would be less imposing on others.

§ 5. *Probability is either of matter of fact, or speculation.*—But to return to the grounds of assent, and the several degrees of it, we are to take notice, that the propositions we receive upon inducements of probability, are of two sorts, either concerning some particular existence, or, as it is usually termed, matter of fact, which falling under observation, is capable of human testimony, or else concerning things, which being beyond the discovery of our senses, are not capable of any such testimony.

§ 6. *The concurrent experience of all other men with ours, produces assurance approaching to knowledge.*—Concerning the first of these, viz. particular matter of fact.

First, Where any particular thing, consonant to the constant observation of ourselves and others in the like case, comes attested by the concurrent reports of all that mention it, we receive it as easily, and build as firmly upon it, as if it were certain knowledge; and we reason and act thereupon with as little doubt, as if it were perfect demonstration. Thus, if all Englishmen, who have occasion to mention it, should affirm, that it froze in England the last winter, or that there were swallows seen there in the summer, I think a man could almost as little doubt of it, as that seven and four are eleven. The first, therefore, and highest degree of probability, is, when the general consent of all men, in all ages, as far as it can be known, concurs with a man's constant and never-failing experience in like cases, to confirm the truth of any particular matter of fact attested by fair witnesses; such are all the stated constitutions and properties of bodies, and the regular proceedings of causes and effects in the ordinary course of nature. This we call an argument from the nature of things themselves; for what our own and other men's constant observation has found always to be after the same manner, that we with reason conclude to be the effect of steady and regular causes, though they come not within the reach of our knowledge. Thus, that fire warmed a man, made lead fluid, and changed the colour or consistency in wood or charcoal; that iron sank in water, and swam in quicksilver: these, and the like propositions about particular facts, being agreeable to our constant experience, as often as we have to do with these matters, and being generally spoken of (when mentioned by others) as things found constantly to be so, and

therefore not so much as controverted by any body, we are put past doubt, that a relation affirming any such thing to have been, or any predication that it will happen again in the same manner, is very true. These probabilities rise so near to a certainty, that they govern our thoughts as absolutely, and influence all our actions as fully, as the most evident demonstration; and in what concerns us, we make little or no difference between them and certain knowledge. Our belief thus grounded, rises to assurance.

§ 7. *Unquestionable testimony and experience for the most part produce confidence.*—*Secondly*, The next degree of probability is, when I find by my own experience, and the agreement of all others that mention it, a thing to be for the most part so; and that the particular instance of it is attested by many and undoubted witnesses, v. g. history giving us such an account of men in all ages, and my own experience, as far as I had an opportunity to observe, confirming it, that most men prefer their private advantage to the public. If all historians that write of Tiberius, say that Tiberius did so, it is extremely probable. And in this case, our assent has a sufficient foundation to raise itself to a degree which we may call confidence.

§ 8. *Fair testimony, and the nature of the thing indifferent, produce also confident belief.*—*Thirdly*, In things that happen indifferently, as that a bird should fly this or that way, that it should thunder on a man's right or left hand, &c. when any particular matter of fact is vouched by the concurrent testimony of unsuspected witnesses, there our assent is also unavoidable. Thus, that there is such a city in Italy as Rome; that about 1700 years ago, there lived in it a man called Julius Cæsar; that he was a general, and that he won a battle against another called Pompey: this, though in the nature of the thing there be nothing for nor against it, yet being related by historians of credit, and contradicted by no one writer, a man cannot avoid believing it, and can as little doubt of it, as he does of the being and actions of his own acquaintance, whereof he himself is a witness.

§ 9. *Experiences and testimonies clashing, infinitely vary the degrees of probability.*—Thus far the matter goes easy enough. Probability upon such grounds carries so much evidence with it, that it naturally determines the judgment, and leaves us as little liberty to believe or disbelieve, as a demonstration does, whether we will know or be ignorant. The difficulty is, when testimonies contradict common experience, and the reports of history and witnesses clash with the ordinary course of nature, or with one another; there it is, where diligence, attention, and exactness are required to form a right judgment, and to proportion the assent to the different evidence and probability of the thing, which rises and falls according as those two foundations of credibility, viz. common observation in like cases, and particular testimonies in that particular instance, favour or contradict it. These are liable to so great a variety of contrary observations, circumstances, reports, different qualifications, tempers, designs, oversights, &c. of the reporters, that it is impossible to reduce to precise rules, the various degrees wherein men give their assent. This only may be said in general, that as the arguments and proofs, *pro* and *con*, upon due exa-

mination, nicely weighing every particular circumstance, shall to any one appear, upon the whole matter, in a greater or less degree, to preponderate on either side, so they are fitted to produce in the mind such different entertainment, as we call belief, conjecture, guess, doubt, wavering, distrust, disbelief, &c.

§ 10. *Traditional testimonies, the farther removed, the less their proofs.*—This is what concerns assent in matters wherein testimony is made use of; concerning which, I think it may not be amiss to take notice of a rule observed in the law of England, which is, that though the attested copy of a record be good proof, yet the copy of a copy ever so well attested, and by ever so credible witnesses, will not be admitted as a proof in judicature. This is so generally approved as reasonable, and suited to the wisdom and caution to be used in our inquiry after material truths, that I never yet heard of any one that blamed it. This practice, if it be allowable in the decisions of right and wrong, carries this observation along with it, viz. that any testimony, the farther off it is from the original truth, the less force and proof it has. The being and existence of the thing itself, is what I call the original truth. A credible man vouching his knowledge of it, is a good proof; but if another, equally credible, do witness it from his report, the testimony is weaker; and a third that attests the hear-say of a hear-say, is yet less considerable. So that in traditional truths, each remove weakens the force of the proof; and the more hands the tradition has successively passed through, the less strength and evidence does it receive from them. This I thought necessary to be taken notice of, because I find amongst some men the quite contrary commonly practised, who look on opinions to gain force by growing older; and what a thousand years since would not, to a rational man, contemporary with the first voucher, have appeared at all probable, is now urged as certain, beyond all question, only because several have since, from him, said it one after another. Upon this ground, propositions evidently false or doubtful enough in their first beginning, come by an inverted rule of probability to pass for authentic truths; and those which found or deserved little credit from the mouths of their first authors, are thought to grow venerable by age, and are urged as undeniable.

§ 11. *Yet history is of great use.*—I would not be thought here to lessen the credit and use of history; it is all the light we have in many cases; and we receive from it a great part of the useful truths we have, with a convincing evidence. I think nothing more valuable than the records of antiquity; I wish we had more of them, and more uncorrupted. But this truth itself forces me to say, that no probability can arise higher than its first original. What has no other evidence than the single testimony of one only witness, must stand or fall by his only testimony, whether good, bad, or indifferent; and though cited afterward by hundreds of others, one after another, is so far from receiving any strength thereby, that it is only the weaker. Passion, interest, inadvertency, mistake of his meaning, and a thousand odd reasons or capricios, men's minds are acted by (impossible to be discovered), may make one man quote another man's words or meaning

wrong. He that has but ever so little examined the citations of writers, cannot doubt how little credit the quotations deserve, where the originals are wanting; and consequently how much less, quotations of quotations can be relied on. This is certain, that what in one age was affirmed upon slight grounds, can never after come to be more valid in future ages, by being often repeated. But the farther still it is from the original, the less valid it is, and has always less force in the mouth or writing of him that last made use of it, than in his from whom he received it.

§ 12. *In things which sense cannot discover, analogy is the great rule of probability.*—The probabilities we have hitherto mentioned, are only such as concern matter of fact, and such things as are capable of observation and testimony. There remains that other sort, concerning which men entertain opinions with variety of assent, though the things be such, that falling not under the reach of our senses, they are not capable of testimony. Such are, 1. The existence, nature, and operations of finite immaterial beings without us; as spirits, angels, devils, &c. or the existence of material beings; which either for their smallness in themselves, or remoteness from us, our senses cannot take notice of, as whether there be any plants, animals, and intelligent inhabitants in the planets, and other mansions of the vast universe. 2. Concerning the manner of operation in most parts of the works of nature; wherein, though we see the sensible effects, yet their causes are unknown, and we perceive not the ways and manner how they are produced. We see animals are generated, nourished, and move; the loadstone draws iron; and the parts of a candle successively melting, turn into flame, and give us both light and heat. These, and the like, effects we see and know; but the causes that operate, and the manner they are produced in, we can only guess, and probably conjecture. For these, and the like, coming not within the scrutiny of human senses, cannot be examined by them, or be attested by any body; and, therefore, can appear more or less probable, only as they more or less agree to truths that are established in our minds, and as they hold proportion to other parts of our knowledge and observation. Analogy, in these matters, is the only help we have, and it is from that alone we draw all our grounds of probability. Thus observing, that the bare rubbing of two bodies violently one upon another, produces heat, and very often fire itself, we have reason to think, that what we call heat and fire, consists in a violent agitation of the imperceptible minute parts of the burning matter: observing likewise, that the different refractions of pellucid bodies, produce in our eyes the different appearances of several colours; and also that the different ranging and laying the superficial parts of several bodies, as of velvet, watered silk, &c. does the like, we think it probable that the colour and shining of bodies, is in them nothing but the different arrangement and refraction of their minute and insensible parts. Thus finding in all parts of the creation, that fall under human observation, that there is a gradual connexion of one with another, without any great or discernible gaps between, in all that great variety of things we see in the world, which are so closely linked together, that, in the several ranks of beings, it is not easy to discover the bounds be-

twixt them ; we have reason to be persuaded, that by such gentle steps, things ascend upwards in degrees of perfection. It is a hard matter to say where sensible and rational begin, and where insensible and irrational end : and who is there quick-sighted enough to determine precisely, which is the lowest species of living things, and which the first of those who have no life? Things, as far as we can observe, lessen and augment as the quantity does in a regular cone, where, though there be a manifest odds betwixt the bigness of the diameter at a remote distance, yet the difference between the upper and under, where they touch one another, is hardly discernible. The difference is exceeding great between some men, and some animals ; but if we will compare the understanding and abilities of some men, and some brutes, we shall find so little difference, that it will be hard to say, that that of the man is either clearer or larger. Observing, I say, such gradual and gentle descents downwards in those parts of the creation that are beneath man, the rule of analogy may make it probable, that it is so also in things above us and our observation ; and that there are several ranks of intelligent beings, excelling us in several degrees of perfection, ascending upwards towards the infinite perfection of the Creator, by gentle steps and differences, that are every one at no great distance from the next to it. This sort of probability, which is the best conduct of rational experiments, and the rise of hypotheses, has also its use and influence ; and a wary reasoning from analogy, leads us often into the discovery of truths, and useful productions, which would otherwise lie concealed.

§ 13. *One case where contrary experience lessens not the testimony.*—Though the common experience, and the ordinary course of things, have justly a mighty influence on the minds of men, to make them give or refuse credit to any thing proposed to their belief ; yet there is one case wherein the strangeness of the fact lessens not the assent to a fair testimony given of it. For where such supernatural events are suitable to ends aimed at by him, who has the power to change the course of nature, there, under such circumstances, they may be the fitter to procure belief, by how much the more they are beyond, or contrary to, ordinary observation. This is the proper case of miracles, which, well attested, do not only find credit themselves, but give it also to other truths, which need such confirmation.

§ 14. *The bare testimony of revelation, is the highest certainty.*—Besides those we have hitherto mentioned, there is one sort of propositions that challenge the highest degree of our assent upon bare testimony, whether the thing proposed agree or disagree with common experience, and the ordinary course of things, or no. The reason whereof is, because the testimony is of such a one as cannot deceive, nor be deceived, and that is of God himself. This carries with it an assurance beyond doubt, evidence beyond exception. This is called by a peculiar name, revelation ; and our assent to it, faith ; which as absolutely determines our minds, and as perfectly excludes all wavering, as our knowledge itself ; and we may as well doubt of our own being, as we can, whether any revelation from God be true. So that faith is a settled and sure principle of assent and assurance, and leaves no manner of room for doubt or hesitation. Only we must be sure that

it be a divine revelation, and that we understand it right; else we shall expose ourselves to all the extravagancy of enthusiasm, and all the error of wrong principles, if we have faith and assurance in what is not divine revelation. And, therefore, in those cases, our assent can be rationally no higher than the evidence of its being a revelation, and that this is the meaning of the expressions it is delivered in. If the evidence of its being a revelation, or that this is its true sense, be only on probable proofs, our assent can reach no higher than an assurance or diffidence, arising from the more or less apparent probability of the proofs. But of faith, and the precedency it ought to have before other arguments of persuasion, I shall speak more hereafter, where I treat of it, as it is ordinarily placed, in contradistinction to reason; though, in truth, it be nothing else but an assent founded on the highest reason.

CHAP. XVII.

OF REASON.

§ 1. *Various significations of the word reason.*—The word reason, in the English language, has different significations; sometimes it is taken for true and clear principles; sometimes for clear and fair deductions from those principles; and sometimes for the cause, and particularly the final cause. But the consideration I shall have of it here, is in a signification different from all these; and that is, as it stands for a faculty in man, that faculty whereby man is supposed to be distinguished from beasts, and wherein it is evident that he surpasses them.

§ 2. *Wherein reasoning consists.*—If general knowledge, as has been shewn, consists in a perception of the agreement or disagreement of our own ideas, and the knowledge of the existence of all things without us (except only of a God, whose existence every man may certainly know and demonstrate to himself from his own existence), be had only by our senses; what room is there for the exercise of any other faculty, but outward sense, and inward perception? What need is there of reason? Very much; both for the enlargement of our knowledge, and regulating our assent: for it hath to do both in knowledge and opinion, and is necessary and assisting to all our other intellectual faculties, and, indeed, contains two of them, viz. sagacity and illation. By the one, it finds out; and by the other, it so orders the intermediate ideas, as to discover what connexion there is in each link of the chain, whereby the extremes are held together; and thereby, as it were, to draw into view the truth sought for, which is that which we call illation or inference, and consists in nothing but the perception of the connexion there is between the ideas in each step of the deduction, whereby the mind comes to see either the certain agreement or disagreement of any two ideas, as of demonstration, in which it arrives at knowledge; or their probable connexion, on which it gives or withholds its assent as in opinion. Sense and intuition reach but a very little way. The greatest part of knowledge depends upon deductions and intermediate ideas; and in those cases where we are fain to substitute assent instead of knowledge, and take propositions for true, without being certain they are so, we have

need to find out, examine, and compare the grounds of their probability. In both these cases, the faculty which finds out the means, and rightly applies them to discover certainty in the one, and probability in the other, is that which we call reason. For as reason perceives the necessary and indubitable connexion of all the ideas or proofs one to another, in each step of any demonstration that produces knowledge; so it likewise perceives the probable connexion of all the ideas or proofs one to another, in every step of a discourse to which it will think assent due. This is the lowest degree of that which can be truly called reason. For where the mind does not perceive this probable connexion; where it does not discern whether there be any such connexion or no; there men's opinions are not the product of judgment, or the consequence of reason, but the effects of chance and hazard; of a mind floating at all adventures, without choice and without direction.

§ 3. *Its four parts.*—So that we may in reason consider these four degrees; the first and highest, is the discovering and finding out of truths; the second, the regular and methodical disposition of them, and laying them in a clear and fit order, to make their connexion and force be plainly and easily perceived; the third, is the perceiving their connexion; and the fourth, a making a right conclusion. These several degrees may be observed in any mathematical demonstration; it being one thing to perceive the connexion of each part, as the demonstration is made by another; another to perceive the dependence of the conclusion on all the parts; a third to make out a demonstration clearly and neatly one's self; and something different from all these, to have first found out those intermediate ideas or proofs by which it is made.

§ 4. *Syllogism not the great instrument of reason.*—There is one thing more which I shall desire to be considered concerning reason; and that is, whether syllogism, as is generally thought, be the proper instrument of it, and the most useful way of exercising this faculty? The causes I have to doubt, are these:

First, Because syllogism serves our reason but in one only of the fore-mentioned parts of it; and that is, to shew the connexion of the proofs in any one instance, and no more; but in this it is of no great use, since the mind can conceive such connexion where it really is, as easily, nay, perhaps better, without it.

If we will observe the actings of our own minds, we shall find that we reason best and clearest, when we only observe the connexion of the proof, without reducing our thoughts to any rule of syllogism. And, therefore, we may take notice, that there are many men that reason exceeding clear and rightly, who know not how to make a syllogism. He that will look into many parts of Asia and America, will find men reason there, perhaps, as acutely as himself, who yet never heard of a syllogism, nor can reduce any one argument to those forms; and I believe scarce any one makes syllogisms in reasoning within himself. Indeed, syllogism is made use of on occasion to discover a fallacy hid in a rhetorical flourish, or cunningly wrapped up in a smooth period; and stripping an absurdity of the cover of wit and good language, shew it in its naked deformity. But the weakness or fallacy of such a loose discourse, it shews by the artificial form it is put into, only to those who

have thoroughly studied mode and figures, and have so examined the many ways that three propositions may be put together, as to know which of them does certainly conclude right, and which not, and upon what grounds it is that they do so. All who have so far considered syllogism, as to see the reason why, in three propositions laid together, in one form, the conclusion will be certainly right; but in another, not certainly so; I grant are certain of the conclusion they draw from the premises in the allowed modes and figures. But they who have not so far looked into those forms, are not sure, by virtue of syllogism, that the conclusion certainly follows from the premises; they only take it to be so by an implicit faith in their teachers, and a confidence in those forms of argumentation; but this is still but believing, not being certain. Now, if of all mankind, those who can make syllogisms, are extremely few in comparison of those who cannot; and if, of those few who have been taught logic, there is but a very small number who do any more than believe that syllogisms in the allowed modes and figures do conclude right, without knowing certainly that they do so; if syllogisms must be taken for the only proper instrument of reason and means of knowledge; it will follow, that before Aristotle, there was not one man that did, or could, know any thing by reason, and that since the invention of syllogisms, there is not one of ten thousand that doth.

But God has not been so sparing to men to make them barely two-legged creatures, and left it to Aristotle to make them rational, i. e. those few of them that he could get so to examine the grounds of syllogisms, as to see, that in above threescore ways that three propositions may be laid together, there are but about fourteen wherein one may be sure that the conclusion is right; and upon what grounds it is, that in these few the conclusion is certain, and in the other not. God has been more bountiful to mankind than so; he has given them a mind that can reason without being instructed in methods of syllogizing: the understanding is not taught to reason by these rules; it has a native faculty to perceive the coherence or incoherence of its ideas, and can range them right, without any such perplexing repetitions. I say not this any way to lessen Aristotle, whom I look on as one of the greatest men amongst the ancients; whose large views, acuteness, and penetration of thought and strength of judgment, few have equalled; and who in this very invention of forms of argumentation, wherein the conclusion may be shewn to be rightly inferred, did great service against those who were not ashamed to deny any thing. And I readily own, that all right reasoning may be reduced to his forms of syllogism. But yet I think, without any diminution to him, I may truly say, that they are not the only, nor the best way of reasoning, for the leading of those into truth who are willing to find it, and desire to make the best use they may of their reason, for the attainment of knowledge. And he himself, it is plain, found out some forms to be conclusive, and others not; not by the forms themselves, but by the original way of knowledge, i. e. by the visible agreement of ideas. Tell a country gentlewoman, that the wind is southwest, and the weather luring, and like to rain, and she will easily understand it is not safe for her to go abroad thin clad, in such a day, after a fever; she clearly sees the probable connexion of all these, viz. south-

west wind, and clouds, rain, wetting, taking cold, relapse, and danger of death, without tying them together in those artificial and cumbersome fetters of several syllogisms, that clog and hinder the mind, which proceeds from one part to another quicker and clearer without them: and the probability which she easily perceives in things thus in their native state, would be quite lost, if this argument were managed learnedly, and proposed in mode and figure. For it very often confounds the connexion: and, I think, every one will perceive in mathematical demonstrations, that the knowledge gained thereby, comes shortest and clearest without syllogisms.

Inference is looked on as the great act of the rational faculty, and so it is, when it is rightly made; but the mind, either very desirous to enlarge its knowledge, or very apt to favour the sentiments it has once imbibed, is very forward to make inferences, and therefore often makes too much haste, before it perceives the connexion of the ideas that must hold the extremes together.

To infer, is nothing but by virtue of one proposition, laid down as true, to draw in another as true, i. e. to see or suppose such a connexion of the two ideas of the inferred proposition, v. g. let this be the proposition laid down, "men shall be punished in another world," and from thence be inferred this other, "then men can determine themselves." The question now is to know, whether the mind has made this inference right, or no? if it has made it, by finding out the intermediate ideas, and taking a view of the connexion of them, placed in a due order, it has proceeded rationally, and made a right inference. If it has done it without such a view, it has not so much made an inference that will hold, or an inference of right reason, as shewn a willingness to have it be, or to be taken for such. But in neither case is it syllogism that discovered those ideas, or shewed the connexion of them, for they must be both found out, and the connexion every where perceived, before they can rationally be made use of in syllogism; unless it can be said, that any idea, without considering what connexion it hath with the two other, whose agreement should be shewn by it, will do well enough in a syllogism, and may be taken at a venture for the *medius terminus*, to prove any conclusion. But this nobody will say, because it is by virtue of the perceived agreement of the intermediate idea, with the extremes, that the extremes are concluded to agree, and therefore each intermediate idea must be such, as in the whole chain hath a visible connexion with those two it has been placed between, or else thereby the conclusion cannot be inferred or drawn in; for wherever any link of the chain is loose, and without connexion, there the whole strength of it is lost, and it hath no force to infer or draw in any thing. In the instance above-mentioned, what it shews the force of the inference, and consequently the reasonableness of it, but a view of the connexion of all the intermediate ideas that draw in the conclusion or proposition inferred; v. g. "men shall be punished;" "God the punisher;" "just punishment;" "the punished guilty;" "could have done otherwise;" "freedom;" "self-determination:" by which chain of ideas thus visibly linked together in train, i. e. each intermediate idea agreeing on each side with those two it is immediately placed between, the ideas of men and self-

determination appear to be connected, i. e. this proposition, "men can determine themselves," is drawn in or inferred from this, "that they shall be punished in the other world." For here the mind seeing the connexion there is between the idea of men's punishment in the other world, and the idea of God punishing; between God punishing, and the justice of the punishment; between justice of the punishment, and guilt; between guilt, and a power to do otherwise; between a power to do otherwise, and freedom, and between freedom, and self-determination, sees the connexion between men, and self-determination.

Now, I ask, whether the connexion of the extremes be not more clearly seen in this simple and natural disposition, than in the perplexed repetitions, and jumble of five or six syllogisms? I must beg pardon for calling it jumble, till somebody shall put these ideas into so many syllogisms, and then say, that they are less jumbled, and their connexion more visible, when they are transposed and repeated, and spun out to a greater length in artificial forms, than in that short and natural plain order they are laid down in here, wherein every one may see it, and wherein they must be seen, before they can be put into a train of syllogisms. For the natural order of the connecting ideas, must direct the order of the syllogisms; and a man must see the connexion of each intermediate idea with those that it connects, before he can with reason make use of it in a syllogism. And when all those syllogisms are made, neither those that are, nor those that are not, logicians, will see the force of the argumentation, i. e. the connexion of the extremes one jot the better. [For those that are not men of art, not knowing the true forms of syllogism, nor the reason of them, cannot know whether they are made in right and conclusive modes and figures or no, and so are not at all helped by the forms they are put into, though by them the natural order, wherein the mind could judge of their respective connexion, being disturbed, renders the illation much more uncertain than without them.] And as for the logicians themselves, they see the connexion of each intermediate idea with those it stands between (on which the force of the inference depends), as well before as after the syllogism is made, or else they do not see it at all. For a syllogism neither shews nor strengthens the connexion of any two ideas immediately put together, but only by the connexion seen in them, shews what connexion the extremes have with one another. But what connexion the intermediate has with either of the extremes in that syllogism, that no syllogism does or can shew. That the mind only doth or can perceive as they stand there in that juxta-position, only by its own view, to which the syllogistical form it happens to be in gives no help or light at all; it only shews, that if the intermediate idea agrees with those it is on both sides immediately applied to; then those two remote ones, or as they are called extremes, do certainly agree, and therefore the immediate connexion of each idea to that which it is applied to on each side, on which the force of the reasoning depends, is as well seen before as after the syllogism is made, or else he that makes the syllogism could never see it at all. This, as has been already observed, is seen only by the eye, or the perceptive faculty of the mind, taking a view of them laid together, in a juxta-position; which view of any two it has equally, whenever they are laid

together in any proposition, whether that proposition be placed as a major, or a minor, in a syllogism, or no.

Of what use then are syllogisms? I answer, their chief and main use is in the schools, where men are allowed, without shame, to deny the agreement of ideas that do manifestly agree; or out of the schools, to those who from thence have learned, without shame, to deny the connexion of ideas, which even to themselves is visible. But to an ingenious searcher after truth, who has no other aim but to find it, there is no need of any such form to force the allowing of the inference: the truth and reasonableness of it is better seen in ranging of the ideas in a simple and plain order. And hence it is, that men in their own inquiries after truth, never use syllogisms to convince themselves [or in teaching others to instruct willing learners], because before they can put them into syllogism, they must see the connexion that is between the intermediate idea, and the two other ideas, it is set between, and applied to, to shew their agreement; and when they see that, they see whether the inference be good or no, and so syllogism comes too late to settle it. For, to make use again of the former instance, I ask whether the mind, considering the idea of justice, placed as an intermediate idea between the punishment of men and the guilt of the punished (and, till it does so consider it, the mind cannot make use of it as a *medius terminus*), does not as plainly see the force and strength of the inference, as when it is formed into syllogism? To shew it in a very plain and easy example: let animal be the intermediate idea, or *medius terminus*, that the mind makes use of to shew the connexion of *homo* and *vivens*; I ask, whether the mind does not more readily and plainly see the connexion in the simple and proper position of the connecting idea in the middle? Thus,

Homo——Animal——Vivens,

Than in this perplexed one,

Animal——Vivens——Homo——Animal.

Which is the position these ideas have in a syllogism, to shew the connexion between *homo* and *vivens* by the intervention of animal.

Indeed, syllogism is thought to be of necessary use, even to the lovers of truth, to shew them the fallacies that are often concealed in florid, witty, or involved discourses. But that this is a mistake, will appear, if we consider that the reason why sometimes men, who sincerely aim at truth, are imposed upon by such loose, and as they are called, rhetorical, discourses, is, that their fancies being struck with some lively metaphorical representations, they neglect to observe, or do not easily perceive, what are the true ideas upon which the inference depends. Now to shew such men the weakness of such an argumentation, there needs no more but to strip it of the superfluous ideas, which, blended and confounded with those on which the inference depends, seem to shew a connexion where there is none, or at least to hinder the discovery of the want of it; and then to lay the naked ideas on which the force of the argumentation depends in their due order, in which position the mind taking a view of them, sees what connexion they have, and so is able to judge of the inference, without any need of a syllogism at all.

I grant that mode and figure is commonly made use of in such cases, as if the detection of the incoherence of such loose discourses, were wholly owing to the syllogistical form ; and so I myself formerly thought, till upon a stricter examination, I now find that laying the intermediate ideas naked in their due order, shews the incoherence of the argumentation better than syllogism ; not only as subjecting each link of the chain to the immediate view of the mind in its proper place, whereby its connexion is best observed ; but also because syllogism shews the incoherence only to those (who are not one of ten thousand) who perfectly understand mode and figure, and the reason upon which those forms are established ; whereas a due and orderly placing of the ideas, upon which the inference is made, makes every one, whether logician or not logician, who understands the terms, and hath the faculty to perceive the agreement or disagreement of such ideas (without which, in or out of syllogism, he cannot perceive the strength or weakness, coherence or incoherence, of the discourse), see the want of connexion in the argumentation, and the absurdity of the inference.

And thus I have known a man unskilful in syllogism, who at first hearing could perceive the weakness and inconclusiveness of a long, artificial, and plausible discourse, wherewith others better skilled in syllogism have been misled ; and I believe there are few of my readers who do not know such. And indeed, if it were not so, the debates of most princes' councils, and the business of assemblies, would be in danger to be mismanaged, since those who are relied upon, and have usually a great stroke in them, are not always such, who have the good luck to be perfectly knowing in the forms of syllogism, or expert in mode and figure. And if syllogism were the only, or so much as the surest, way to detect the fallacies of artificial discourses, I do not think that all mankind, even princes in matters that concern their crowns and dignities, are so much in love with falsehood and mistake, that they would every where have neglected to bring syllogism into the debates of moment, or thought it ridiculous so much as to offer them in affairs of consequence ; a plain evidence to me, that men of parts and penetration, who were not idly to dispute at their ease, but were to act according to the result of their debates, and often pay for their mistakes with their heads or fortunes, found those scholastic forms were of little use to discover truth or fallacy, whilst both the one and the other might be shewn, and better shewn, without them, to those who would not refuse to see what was visibly shewn them.

Secondly, Another reason that makes me doubt whether syllogism be the only proper instrument of reason in the discovery of truth, is, that of whatsoever use mode and figure is pretended to be in the laying open of fallacy (which has been above considered), those scholastic forms of discourse are not less liable to fallacies, than the plainer ways of argumentation ; and for this I appeal to common observation, which has always found these artificial methods of reasoning more adapted to catch and entangle the mind, than to instruct and inform the understanding. And hence it is, that men, even when they are baffled and silenced in this scholastic way, are seldom or never convinced, and so brought over to the conquering side ; they perhaps acknowledge their

adversary to be the more skilful disputant, but rest nevertheless persuaded of the truth on their side; and go away, worsted as they are, with the same opinion they brought with them, which they could not do, if this way of argumentation carried light and conviction with it, and made men see where the truth lay; and therefore syllogism has been thought more proper for the attaining victory in dispute, than for the discovery or confirmation of truth, in fair inquiries: and if it be certain, that fallacy can be couched in syllogisms, as it cannot be denied, it must be something else, and not syllogism, that must discover them.

I have had experience how ready some men are, when all the use which they have been wont to ascribe to any thing is not allowed, to cry out, that I am for laying it wholly aside. But to prevent such unjust and groundless imputations, I tell them, that I am not for taking away any helps to the understanding, in the attainment of knowledge. And if men skilled in, and used to, syllogisms, and find them assisting to their reason in the discovery of truth, I think they ought to make use of them. All that I aim at is, that they should not ascribe more to those forms, than belongs to them; and think, that men have no use, or not so full a use, of their reasoning faculty, without them. Some eyes want spectacles to see things clearly and distinctly; but let not those that use them therefore say nobody can see clearly without them: those who do so, will be thought in favour with art (which perhaps they are beholding to) a little too much to depress and discredit nature. Reason, by its own penetration, where it is strong and exercised, usually sees quicker and clearer without syllogism. If use of those spectacles has so dimmed its sight, that it cannot without them see consequences or inconsequences in argumentation, I am not so unreasonable as to be against the using them. Every one knows what best fits his own sight: but let him not thence conclude all in the dark, who use not just the same helps that he finds a need of.

§ 5. *Helps little in demonstration, less in probability.*—But however it be in knowledge, I think I may truly say it is of far less, or no use at all, in probabilities. For the assent there being to be determined by the preponderancy, after a due weighing of all the proof, with all circumstances on both sides, nothing is so unfit to assist the mind in that, as syllogism; which running away with one assumed probability, or one topical argument, pursues that till it has led the mind quite out of sight of the thing under consideration; and forcing it upon some remote difficulty, holds it fast there entangled perhaps, and as it were manacled in the chain of syllogisms, without allowing it the liberty, much less affording it the helps, requisite to shew on which side, all things considered, is the greater probability.

§ 6. *Serves not to increase our knowledge, but fence with it.*—But let it help us (as perhaps may be said) in convincing men of their errors and mistakes (and yet I would fain see the man that was forced out of his opinion by dint of syllogism): yet still it fails our reason in that part, which, if not its highest perfection, is yet certainly its hardest task, and that which we most need its help in; and that is, the finding out of proofs, and making new discoveries. The rules of syllogism serve not to furnish the mind with those intermediate ideas that may shew the

connexion of remote ones. This way of reasoning discovers no new proofs, but is the art of marshalling and ranging the old ones we have already. The forty-seventh proposition of the first book of Euclid, is very true; but the discovery of it, I think, not owing to any rules of common logic. A man knows first, and then he is able to prove syllogistically; so that syllogism comes after knowledge, and then a man has little or no need of it. But it is chiefly by the finding out those ideas that shew the connexion of distant ones, that our stock of knowledge is increased, and that useful arts and sciences are advanced. Syllogism, at best, is but the art of fencing with the little knowledge we have, without making any addition to it. And if a man should employ his reason all this way, he will not do much otherwise than he, who having got some iron out of the bowels of the earth, should have it beaten up all into swords, and put it into his servants' hands to fence with, and bang one another. Had the King of Spain employed the hands of his people, and his Spanish iron so, he had brought to light but little of that treasure that lay so long hid in the entrails of America. And I am apt to think, that he who shall employ all the force of his reason only in brandishing of syllogisms, will discover very little of that mass of knowledge which lies yet concealed in the secret recesses of nature; and which, I am apt to think, native rustic reason (as it formerly has done) is likelier to open a way to, and add to the common stock of mankind, rather than any scholastic proceeding by the strict rules of mode and figure.

§ 7. *Other helps should be sought.*—I doubt not, nevertheless, but there are ways to be found to assist our reason in this most useful part; and this the judicious Hooker encourages me to say, who in his *Eccl. Pol.* l. i. § 6. speaks thus: "If there might be added the right helps of true art and learning (which helps I must plainly confess, this age of the world, carrying the name of a learned age, doth neither much know, nor generally regard), there would undoubtedly be almost as much difference in maturity of judgment between men therewith inured, and that which men now are, as between men that are now, and innocents." I do not pretend to have found or discovered here any of those right helps of art this great man of deep thought mentions: but this is plain, that syllogism, and the logic now in use, which were as well known in his days, can be none of those he means. It is sufficient for me, if by a discourse perhaps something out of the way, I am sure as to me wholly new and unborrowed, I shall have given occasion to others to cast about for new discoveries, and to seek in their own thoughts for those right helps of art which will scarce be found, I fear, by those who servilely confine themselves to the rules and dictates of others: for beaten tracks lead this sort of cattle (as an observing Roman calls them), whose thoughts reach only to imitation, *non quo eundum est, sed quo itur*. But I can be bold to say, that this age is adorned with some men of that strength of judgment, and largeness of comprehension, that if they would employ their thoughts on this subject, could open new and undiscovered ways to the advancement of knowledge.

§ 8. *We reason about particulars.*—Having here had an occasion to speak of syllogism in general, and the use of it in reasoning, and the

improvement of our knowledge, it is fit, before I leave this subject, to take notice of one manifest mistake in the rules of syllogism, viz. that no syllogistical reasoning can be right and conclusive, but what has, at least, one general proposition in it. As if we could not reason, and have knowledge about particulars. Whereas, in truth, the matter rightly considered, the immediate object of all our reasoning and knowledge, is nothing but particulars. Every man's reasoning and knowledge is only about the ideas existing in his own mind, which are truly, every one of them, particular existences; and our knowledge and reason about other things, is only as they correspond with those of our particular ideas. So that the perception of the agreement or disagreement of our particular ideas, is the whole and utmost of all our knowledge. Universality is but accidental to it, and consists only in this, that the particular ideas about which it is, are such, as more than one particular thing can correspond with, and be represented by. But the perception of the agreement or disagreement of any two ideas, consequently our own knowledge, is equally clear and certain, whether either, or both, or neither, of those ideas be capable of representing more real beings than one, or no. One thing more I crave leave to offer about syllogism, before I leave it, viz. may one not upon just ground inquire whether the form syllogism now has, is that which in reason it ought to have? For the *medius terminus* being to join the extremes, *i. e.* the intermediate idea by its intervention, to shew the agreement or disagreement of the two in question; would not the position of the *medius terminus* be more natural, and shew the agreement or disagreement of the extremes clearer and better, if it were placed in the middle between them? Which might be easily done by transposing the propositions, and making the *medius terminus* the predicate of the first, and the subject of the second. As thus,

“ Omnis homo est animal,
Omne animal est vivens,
Ergo omnis homo est vivens.”

“ Omne corpus est extensum et solidum,
Nullum extensum et solidum est pura extensio,
Ergo corpus non est pura extensio.”

I need not trouble my reader with instances in syllogisms, whose conclusions are particular. The same reason holds for the same form in them, as well as in the general.

§ 9. *First, reason fails us for want of ideas.*—Reason, though it penetrates into the depths of the sea and earth, elevates our thoughts as high as the stars, and leads us through the vast spaces and large rooms of this mighty fabric, yet it comes far short of the real extent of even corporeal being; and there are many instances wherein it fails us: as,

First, It perfectly fails us, where our ideas fail. It neither does, nor can, extend itself farther than they do. And therefore wherever we have no ideas, our reasoning stops, and we are at an end of our reckoning: and if at any time we reason about words, which do not stand for any ideas, it is only about those sounds, and nothing else.

§ 10. *Secondly, because of obscure and imperfect ideas.*—*Secondly*,

Our reason is often puzzled, and at a loss, because of the obscurity, confusion, or imperfection of the ideas it is employed about; and there we are involved in difficulties and contradictions. Thus, not having any perfect idea of the least extension of matter, nor of infinity, we are at a loss about the divisibility of matter; but having perfect, clear, and distinct ideas of number, our reason meets with none of those inextricable difficulties in numbers, nor finds itself involved in any contradictions about them. Thus, we having but imperfect ideas of the operations of our minds, and of the beginning of motion or thought, how the mind produces either of them in us; and much more imperfect yet of the operation of God; run into great difficulties about free created agents, which reason cannot well extricate itself out of.

§ 11. *Thirdly, for want of intermediate ideas.*—*Thirdly*, Our reason is often at a stand, because it perceives not those ideas, which could serve to shew the certain or probable agreement or disagreement of any other two ideas: and in this some men's faculties far outgo others. Till algebra, that great instrument and instance of human sagacity, was discovered, men, with amazement, looked on several of the demonstrations of ancient mathematicians, and could scarce forbear to think the finding several of those proofs to be something more than human.

§ 12. *Fourthly, because of wrong principles.*—*Fourthly*, The mind by proceeding upon false principles, is often engaged in absurdities and difficulties, brought into straits and contradictions, without knowing how to free itself: and in that case it is in vain to implore the help of reason unless it be to discover the falsehood, and reject the influence of those wrong principles. Reason is so far from clearing the difficulties which the building upon false foundations brings a man into, that if he will pursue it, it entangles him the more, and engages him deeper in perplexities.

§ 13. *Fifthly, because of doubtful terms.*—*Fifthly*, As obscure and imperfect ideas often involve our reason, so upon the same ground do dubious words, and uncertain signs, often in discourses and arguings, when not warily attended to, puzzle men's reason, and bring them to a nonplus: but these two latter are our fault, and not the fault of reason. But yet the consequences of them are nevertheless obvious; and the perplexities or errors they fill men's minds with, are every where observable.

§ 14. *Our highest degree of knowledge is intuitive, without reasoning.*—Some of the ideas that are in the mind, are so there, that they can be by themselves immediately compared one with another: and in these the mind is able to perceive, that they agree, or disagree, as clearly as that it has them. Thus the mind perceives, that an arch of a circle is less than the whole circle, as clearly as it does the idea of a circle: and this, therefore, as has been said, I call intuitive knowledge, which is certain, beyond all doubt, and needs no probation, nor can have any; this being the highest of all human certainty. In this consists the evidence of all those maxims which nobody has any doubt about, but every man (does not, as is said, only assent to, but) knows to be true, as soon as ever they are proposed to his understanding. In the discovery of, and assent to, these truths, there is no use of the discursive faculty, no

need of reasoning, but they are known by a superior and higher degree of evidence. And such, if I may guess at things unknown, I am apt to think that angels have now, and the spirits of just men made perfect shall have, in a future state, of thousands of things, which now either wholly escape our apprehensions, or which our short-sighted reason having got some faint glimpse of, we, in the dark, grope after.

§ 15. *The next is demonstration by reasoning.*—But though we have here and there a little of this clear light, some sparks of bright knowledge; yet the greatest part of our ideas are such, that we cannot discern their agreement or disagreement, by an immediate comparing them. And in all these we have need of reasoning, and must, by discourse and inference, make our discoveries. Now, of these there are two sorts, which I shall take the liberty to mention here again:

First, Those whose agreement or disagreement, though it cannot be seen by an immediate putting them together, yet may be examined by the intervention of other ideas, which can be compared with them. In this case, when the agreement or disagreement of the intermediate idea, on both sides with those which we would compare, is plainly discerned, there it amounts to a demonstration, whereby knowledge is produced, which though it be certain, yet it is not so easy, nor altogether so clear, as intuitive knowledge; because in that there is barely one simple intuition, wherein there is no room for any the least mistake or doubt; the truth is seen all perfectly at once. In demonstration, it is true, there is intuition too, but not altogether at once: for there must be a remembrance of the intuition of the agreement of the medium, or intermediate idea, with that we compare it with before, when we compare it with the other; and where there be many mediums, there the danger of the mistake is the greater. For each agreement or disagreement of the ideas, must be observed and seen in each step of the whole train, and retained in the memory, just as it is, and the mind must be sure that no part of what is necessary to make up the demonstration, is omitted or over-looked. This makes some demonstrations long and perplexed, and too hard for those who have not strength of parts distinctly to perceive, and exactly carry so many particulars orderly in their heads. And even those, who are able to master such intricate speculations, are fain sometimes to go over them again, and there is need of more than one review before they can arrive at certainty. But yet where the mind clearly retains the intuition it had of the agreement of any idea with another, and that with a third, and that with a fourth, &c. there the agreement of the first and the fourth is a demonstration, and produces certain knowledge, which may be called rational knowledge, as the other is intuitive.

§ 16. *To supply the narrowness of this, we have nothing but judgment upon probable reasoning.*—*Secondly*, There are other ideas, whose agreement or disagreement can no otherwise be judged of but by the intervention of others, which have not a certain agreement with the extremes, but a usual or likely one; and in these it is, that the judgment is properly exercised, which is the acquiescing of the mind, that any ideas do agree, by comparing them with such probable mediums. This, though it never amounts to knowledge, no, not to that which is

the lowest degree of it, yet sometimes the intermediate ideas tie the extremes so firmly together, and the probability is so clear and strong, that assent as necessarily follows it, as knowledge does demonstration. The great excellency and use of the judgment is to observe right, and take a true estimate of the force and weight of each probability; and then casting them up all right together, choose that side which has the overbalance.

§ 17. *Intuition, demonstration, judgment.*—Intuitive knowledge is the perception of the certain agreement or disagreement of two ideas, immediately compared together.

Rational knowledge is the perception of the certain agreement or disagreement of any two ideas, by the intervention of one or more other ideas.

Judgment, is the thinking or taking two ideas to agree or disagree by the intervention of one or more ideas, whose certain agreement or disagreement with them it does not perceive, but hath observed to be frequent and usual.

§ 18. *Consequences of words, and consequences of ideas.*—Though the deducing one proposition from another, or making inferences in words, be a great part of reason, and that which it is usually employed about, yet the principal act of ratiocination, is the finding the agreement or disagreement of two ideas one with another, by the intervention of a third. As a man, by a yard, finds two houses to be of the same length, which could not be brought together to measure their equality by juxtaposition. Words have their consequences, as the signs of such ideas: and things agree or disagree, as really they are; but we observe it only by our ideas.

§ 19. *Four sorts of arguments. First, ad verecundiam.*—Before we quit this subject, it may be worth our while a little to reflect on four sorts of arguments, that men in their reasonings with others do ordinarily make use of, to prevail on their assent; or at least so to awe them, as to silence their opposition.

First, The first is, to allege the opinions of men, whose parts, learning, eminency, power, or some other cause, has gained a name, and settled their reputation in the common esteem with some kind of authority. When men are established in any kind of dignity, it is thought a breach of modesty for others to derogate any way from it, and question the authority of men, who are in possession of it. This is apt to be censured, as carrying with it too much of pride, when a man does not readily yield to the determination of approved authors, which is wont to be received with respect and submission by others; and it is looked upon as insolence for a man to set up, and adhere to, his own opinion, against the current stream of antiquity; or to put it in the balance against that of some learned doctor, or otherwise approved writer. Whoever backs his tenets with such authorities, thinks he ought thereby to carry the cause, and is ready to style it impudence in any one who shall stand out against them. This, I think, may be called *argumentum ad verecundiam*.

§ 20. *Secondly, ad ignorantiam.*—*Secondly,* Another way that men ordinarily use to drive others, and force them to submit their judgments, and receive the opinion in debate, is to require the adversary to admit

what they allege as a proof, or to assign a better. And this I call *argumentum ad ignorantiam*.

§ 21. *Thirdly, ad hominem*.—A third way is to press a man with consequences drawn from his own principles or concessions. This is already known under the name of *argumentum ad hominem*.

§ 22. *Fourthly, ad judicium*.—The fourth is the using of proofs drawn from any of the foundations of knowledge or probability. This I call *argumentum ad judicium*. This alone, of all the four, brings true instruction with it, and advances us in our way to knowledge. For 1. It argues not another man's opinion to be right, because I, out of respect, or any other consideration, but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, nor that I ought to take the same with him, because I know not a better. 3. Nor does it follow, that another man is in the right way, because he hath shewn me that I am in the wrong. I may be modest, and, therefore, not oppose another man's persuasion; I may be ignorant, and not be able to produce a better; I may be in an error, and another may shew me that I am so. This may dispose me, perhaps, for the reception of truth, but helps me not to it; that must come from proofs and arguments, and light arising from the nature of things themselves, and not from my shamefacedness, ignorance, or error.

§ 23. *Above, contrary, and according to reason*.—By what has been before said of reason, we may be able to make some guess at the distinction of things, into those that are according to, above, and contrary to reason. 1. According to reason are such propositions, whose truth we can discover, by examining and tracing those ideas we have from sensation and reflection; and by natural deduction find to be true or probable. 2. Above reason, are such propositions, whose truth or probability we cannot, by reason, derive from those principles. 3. Contrary to reason, are such propositions, as are inconsistent with, or irreconcilable to, our clear and distinct ideas. Thus the existence of one God, is according to reason: the existence of more than one God, contrary to reason: the resurrection of the dead, above reason. Farther, as above reason may be taken in a double sense, viz. either as signifying above probability, or above certainty; so in that large sense also, contrary to reason, is, I suppose, sometimes taken.

§ 24. *Reason and faith not opposite*.—There is another use of the word reason, wherein it is opposed to faith: which, though it be in itself a very improper way of speaking, yet common use has so authorised it, that it would be folly either to oppose or hope to remedy it: only I think it may not be amiss to take notice, that however faith be opposed to reason, faith is nothing but a firm assent of the mind; which if it be regulated, as is our duty, cannot be afforded to any thing but upon good reason, and so cannot be opposite to it. He that believes, without having any reason for believing, may be in love with his own fancies; but neither seeks truth as he ought, nor pays the obedience due to his Maker, who would have him use those discerning faculties he has given him, to keep him out of mistake and error. He that does not this, to the best of his power, however he sometimes lights on truth, is in the right but by chance; and I know not whether the luckiness of

the accident will excuse the irregularity of his proceeding. This, at least, is certain, that he must be accountable for whatever mistakes he runs into; whereas, he that makes use of the light and faculties God has given him, and seeks sincerely to discover truth, by those helps and abilities he has, may have this satisfaction in doing his duty as a rational creature, that though he should miss truth, he will not miss the reward of it; for he governs his assent right, and places it as he should, who, in any case or matter whatsoever, believes or disbelieves according as reason directs him. He that doth otherwise, transgresses against his own light, and misuses those faculties which were given him to no other end, but to search and follow the clearer evidence, and greater probability. But since reason and faith are by some men opposed, we will so consider them in the following chapter.

CHAP. XVIII.

OF FAITH AND REASON, AND THEIR DISTINCT PROVINCES.

§ 1. *Necessary to know their boundaries.*—It has been above shewn, *First*, That we are of necessity ignorant, and want knowledge of all sorts, where we want ideas. *Secondly*, That we are ignorant, and want rational knowledge, where we want proofs. *Thirdly*, That we want general knowledge and certainty, as far as we want clear and determined specific ideas. *Fourthly*, That we want probability to direct our assent in matters where we have neither knowledge of our own, nor testimony of other men, to botton our reason upon.

From these things thus premised, I think we may come to lay down the measures and boundaries between faith and reason; the want thereof may possibly have been the cause, if not of great disorders, yet, at least, of great disputes, and perhaps mistakes, in the world; for until it be resolved how far we are to be guided by reason, and how far by faith, we shall in vain dispute, and endeavour to convince one another in matters of religion.

§ 2. *Faith and reason what, as contra-distinguished.*—I find every sect, as far as reason will help them, make use of it gladly; and where it fails them, they cry out, it is matter of faith, and above reason. And I do not see how they can argue with any one, or ever convince a gainsayer, who makes use of the same plea, without setting down strict boundaries between faith and reason, which ought to be the first point established in all questions, where faith has any thing to do.

Reason, therefore, here, as contra-distinguished to faith, I take to be the discovery of the certainty or probability of such propositions or truths, which the mind arrives at by deduction made from such ideas which it has got by the use of its natural faculties, viz. by sensation or reflection.

Faith, on the other side, is the assent to any proposition, not thus made out by the deductions of reason, but upon the credit of the proposer, as coming from God in some extraordinary way of communication. This way of discovering truths to men, we call revelation.

§ 3. *No new simple idea can be conveyed by traditional revelation.*

—First, then, I say, that no man, inspired by God, can by any revelation, communicate to others any new simple ideas, which they had not before from sensation or reflection; for whatsoever impressions he himself may have from the immediate hand of God, this revelation, if it be of new simple ideas, cannot be conveyed to another, either by words or any other signs; because words, by their immediate operation on us, cause no other ideas but of their natural sounds; and it is by the custom of using them for signs, that they excite and revive in our minds latent ideas; but yet only such ideas as were there before. For words seen or heard, recal to our thoughts those ideas only, which to us they have been wont to be signs of; but cannot introduce any perfectly new, and formerly unknown, simple ideas. The same holds in all other signs, which cannot signify to us things of which we have before never had any idea at all.

Thus whatever things were discovered to St. Paul when he was wrapped up into the third heaven, whatever new ideas his mind there received, all the description he can make to others of that place, is only this, that there are such things as “eye hath not seen, nor ear heard, nor hath it entered into the heart of man to conceive.” And supposing God should discover to any one, supernaturally, a species of creatures inhabiting, for example, Jupiter or Saturn (for that it is possible there may be such, nobody can deny), which had six senses; and imprint on his mind the ideas conveyed to theirs by that sixth sense, he could no more, by words, produce in the minds of other men those ideas, imprinted by that sixth sense, than one of us could convey the idea of any colour by the sounds of words into a man, who having the other four senses perfect, had always totally wanted the fifth, of seeing. For our simple ideas, then, which are the foundation and sole matter of all our notions and knowledge, we must depend wholly on our reason, I mean our natural faculties, and can by no means receive them, or any of them, from traditional revelation; I say, traditional revelation, in distinction to original revelation. By the one, I mean that first impression which is made immediately by God, on the mind of any man, to which we cannot set any bounds; and by the other, those impressions delivered over to others in words, and the ordinary ways of conveying our conceptions one to another.

§ 4. *Traditional revelation may make us know propositions knowable also by reason, but not with the same certainty that reason doth.*

—Secondly, I say, that the same truths may be discovered, and conveyed down from revelation, which are discoverable to us by reason, and by those ideas we naturally may have. So God might, by revelation, discover the truth of any proposition in Euclid; as well as men, by the natural use of their faculties, come to make the discovery themselves. In all things of this kind, there is little need or use of revelation, God having furnished us with a natural and surer means to arrive at the knowledge of them. For whatsoever truth we come to the clear discovery of, from the knowledge and contemplation of our own ideas, will always be more certain to us, than those which are conveyed to us by traditional revelation. For the knowledge we have that this revelation came at first from God, can never be so sure as the knowledge

we have from the clear and distinct perception of the agreement or disagreement of our own ideas, v. g. if it were revealed some ages since, that the three angles of a triangle were equal to two right ones, I might assent to the truth of that proposition, upon the credit of the tradition, that it was revealed. But that would never amount to so great a certainty as the knowledge of it, upon the comparing and measuring my own ideas of two right angles, and the three angles of a triangle. The like holds in matter of fact, knowable by our senses, v. g. the history of the deluge is conveyed to us by writings, which had their original from revelation: and yet nobody, I think, will say, he has as certain and clear a knowledge of the flood, as Noah, that saw it; or that he himself would have had, had he then been alive, and seen it. For he has no greater an assurance than that of his senses, that it is writ in the book supposed writ by Moses, inspired; but he has not so great an assurance that Moses writ that book, as if he had seen Moses write it. So that the assurance of its being a revelation, is less still than the assurance of his senses.

§ 5. *Revelation cannot be admitted against the clear evidence of reason.*—In propositions, then, whose certainty is built upon the clear perception of the agreement or disagreement of our ideas, attained either by immediate intuition, as in self-evident propositions, or by evident deductions of reason in demonstrations, we need not the assistance of revelation, as necessary to gain our assent, and introduce them into our minds; because the natural ways of knowledge could settle them there, or had done it already, which is the greatest assurance we can possibly have of any thing, unless where God immediately reveals it to us. And there too our assurance can be no greater than our knowledge is, that it is a revelation from God. But yet nothing I think can, under that title, shake or even overrule plain knowledge, or rationally prevail with any man to admit it for true, in a direct contradiction to the clear evidence of his own understanding. For since no evidence of our faculties, by which we receive such revelations, can exceed, if equal, the certainty of our intuitive knowledge, we can never receive for a truth any thing that is directly contrary to our clear and distinct knowledge, v. g. the ideas of one body and one place, do so clearly agree, and the mind has so evident a perception of their agreement, that we can never assent to a proposition that affirms the same body to be in two distant places at once, however it should pretend to the authority of a divine revelation; since the evidence, *First*, That we deceive not ourselves in ascribing it to God; *Secondly*, That we understand it right; can never be so great, as the evidence of our own intuitive knowledge, whereby we discern it impossible for the same body to be in two places at once. And therefore no proposition can be received for divine revelation, or obtain the assent due to all such, if it be contradictory to our clear and intuitive knowledge. Because this would be to subvert the principles and foundations of all knowledge, evidence, and assent whatsoever; and there would be left no difference between truth and falsehood, no measures of credible and incredible in the world, if doubtful propositions shall take place before self-evident, and what we certainly know give way to what we

may possibly be mistaken in. In propositions, therefore, contrary to the clear perception of the agreement or disagreement of any of our ideas, it will be in vain to urge them as matters of faith. They cannot move our assent, under that or any other title whatsoever: for faith can never convince us of any thing that contradicts our knowledge, because, though faith be founded on the testimony of God (who cannot lie) revealing any proposition to us; yet we cannot have an assurance of the truth of its being a divine revelation, greater than our own knowledge: since the whole strength of the certainty depends upon our knowledge, that God revealed it, which in this case, where the proposition supposed revealed contradicts our knowledge or reason, will always have this objection hanging to it, viz. that we cannot tell how to conceive that to come from God, the bountiful Author of our being, which, if received for true, must overturn all the principles and foundations of knowledge he has given us; render all our faculties useless; wholly destroy the most excellent part of his workmanship, our understandings; and put a man in a condition, wherein he will have less light, less conduct, than the beast that perisheth. For if the mind of man can never have a clearer (and perhaps not so clear) evidence of any thing to be a divine revelation, as it has of the principles of its own reason, it can never have a ground to quit the clear evidence of its reason, to give place to a proposition, whose revelation has not a greater evidence than those principles have.

§ 6. *Traditional revelation much less.*—Thus far a man has use of reason, and ought to hearken to it, even in immediate and original revelation, where it is supposed to be made to himself: but to all those who pretend not to immediate revelation, but are required to pay obedience, and to receive the truths revealed to others, which by the tradition of writings, or word of mouth, are conveyed down to them, reason has a great deal more to do, and is that only which can induce us to receive them. For matter of faith being only divine revelation, and nothing else; faith, as we use the word (called commonly divine faith), has to do with no propositions, but those which are supposed to be divinely revealed. So that I do not see how those, who make revelation alone the sole object of faith, can say, that it is a matter of faith, and not of reason, to believe, that such or such a proposition, to be found in such or such a book, is of divine inspiration; unless it be revealed, that that proposition, or all in that book, was communicated by divine inspiration. Without such a revelation, the believing or not believing that proposition, or book, to be of divine authority, can never be matter of faith, but matter of reason; and such as I must come to an assent to, only by the use of my reason, which can never require or enable me to believe that which is contrary to itself; it being impossible for reason ever to procure any assent to that, which to itself appears unreasonable.

In all things, therefore, where we have clear evidence from our ideas, and those principles of knowledge I have above-mentioned, reason is the proper judge; and revelation, though it may in consenting with it confirm its dictates, yet cannot in such cases invalidate its decrees; nor can we be obliged, where we have the clear and evident sentence of

reason, to quit it for the contrary opinion, under a pretence that it is a matter of faith; which can have no authority against the plain and clear dictates of reason.

§ 7. *Things above reason.*—But, *Thirdly*, there being many things, wherein we have very imperfect notions, or none at all; and other things, of whose past, present, or future existence, by the natural use of our faculties, we can have no knowledge at all, these, as being beyond the discovery of our natural faculties, and above reason, are, when revealed, the proper matter of faith. Thus, that part of the angels rebelled against God, and thereby lost their first happy state; and that the dead shall rise, and live again: these, and the like, being beyond the discovery of reason, are purely matters of faith; with which reason has directly nothing to do.

§ 8. *Or not contrary to reason, if revealed, are matter of faith.*—But, since God, in giving us the light of reason, has not thereby tied up his own hand from affording us, when he thinks fit, the light of revelation in any of those matters, wherein our natural faculties are able to give a probable determination; revelation, where God has been pleased to give it, must carry it against the probable conjectures of reason, because the mind not being certain of the truth of that it does not evidently know, but only yielding to the probability that appears in it, is bound to give up its assent to such a testimony; which, it is satisfied, comes from one who cannot err, and will not deceive. But yet it still belongs to reason, to judge of the truth of its being a revelation, and of the signification of the words wherein it is delivered. Indeed, if any thing shall be thought revelation, which is contrary to the plain principles of reason, and the evident knowledge the mind has of its own clear and distinct ideas, there reason must be hearkened to, as to a matter within its province. Since a man can never have so certain a knowledge, that a proposition, which contradicts the clear principles and evidence of his own knowledge, was divinely revealed, or that he understands the words rightly wherein it is delivered, as he has that the contrary is true; and so is bound to consider and judge of it as a matter of reason, and not swallow it, without examination, as a matter of faith.

§ 9. *Revelation in matters where reason cannot judge, or but probably, ought to be hearkened to.*—*First*, Whatever proposition is revealed, of whose truth our mind, by its natural faculties and notions, cannot judge, that is purely matter of faith, and above reason.

Secondly, All propositions, whereof the mind, by the use of its natural faculties, can come to determine and judge, from naturally acquired ideas, are matter of reason; with this difference still, that in those concerning which it has but an uncertain evidence, and so is persuaded of their truth only upon probable grounds, which still admit a possibility of the contrary to be true, without doing violence to the certain evidence of its own knowledge, and overturning the principles of its own reason in such probable propositions, I say, an evident revelation ought to determine our assent even against probability. For where the principles of reason have not evidenced a proposition to be certainly true or false, there clear revelation, as another principle of truth, and ground

of assent, may determine: and so it may be matter of faith, and be also above reason; because reason, in that particular matter, being able to reach no higher than probability, faith gave the determination where reason came short; and revelation discovered on which side the truth lay.

§ 10. *In matters where reason can afford certain knowledge, that is to be hearkened to.*—Thus far the dominion of faith reaches, and that without any violence or hindrance to reason; which is not injured, or disturbed, but assisted and improved, by new discoveries of truth, coming from the eternal Fountain of all knowledge. Whatever God hath revealed, is certainly true; no doubt can be made of it. This is the proper object of faith: but whether it be a divine revelation, or no, reason must judge; which can never permit the mind to reject a greater evidence, to embrace what is less evident, nor allow it to entertain probability in opposition to knowledge and certainty. There can be no evidence, that any traditional revelation is of divine original, in the words we receive it, and in the sense we understand it, so clear, and so certain, as that of the principles of reason: and therefore, nothing that is contrary to, and inconsistent with, the clear and self-evident dictates of reason, has a right to be urged or assented to, as a matter of faith, wherein reason hath nothing to do. Whatsoever is divine revelation, ought to over-rule all our opinions, prejudices, and interests, and hath a right to be received with full assent; such a submission as this of our reason to faith, takes not away the land-marks of knowledge: this shakes not the foundations of reason, but leaves us that use of our faculties, for which they were given us.

§ 11. *If the boundaries be not set between faith and reason, no enthusiasm, or extravagancy in religion, can be contradicted.*—If the provinces of faith and reason are not kept distinct by these boundaries, there will, in matters of religion, be no room for reason at all; and those extravagant opinions and ceremonies, that are to be found in the several religions of the world, will not deserve to be blamed. For, to this crying up of faith, in opposition to reason, we may, I think, in good measure, ascribe those absurdities that fill almost all the religions which possess and divide mankind. For men having been principled with an opinion, that they must not consult reason in the things of religion, however apparently contradictory to common sense, and the very principles of all their knowledge, have let loose their fancies, and natural superstition; and have been, by them, led into so strange opinions, and extravagant practices, in religion, that a considerate man cannot but stand amazed at their follies, and judge them so far from being acceptable to the great and wise God, that he cannot avoid thinking them ridiculous and offensive to a sober, good, man. So that, in effect, religion, which should most distinguish us from beasts, and ought most peculiarly to elevate us, as rational creatures, above brutes, is that wherein men often appear most irrational, and more senseless than beasts themselves. *Credo, quia impossibile est*, I believe, because it is impossible, might in a good man pass for a sally of zeal; but would prove a very ill rule for men to choose their opinions or religion by.

CHAP. XIX.

OF ENTHUSIASM.

§ 1. *Love of truth necessary.*—He that would seriously set upon the search of truth, ought in the first place to prepare his mind with a love of it; for he that loves it not, will not take much pains to get it, nor be much concerned when he misses it. There is nobody in the commonwealth of learning, who does not profess himself a lover of truth: and there is not a rational creature that would not take it amiss to be thought otherwise of. And yet for all this, one may truly say, that there are very few lovers of truth for truth's sake, even amongst those who persuade themselves that they are so. How a man may know whether he be so in earnest, is worth inquiry: and I think there is one unerring mark of it, viz. the not entertaining any proposition with greater assurance, than the proofs it is built upon will warrant. Whoever goes beyond this measure of assent, it is plain, receives not truth in the love of it; loves not truth for truth's sake, but for some other by-end. For the evidence that any proposition is true (except such as are self-evident) lying only in the proofs a man has of it, whatsoever degrees of assent he affords it beyond the degrees of that evidence, it is plain, that all the surplusage of assurance is owing to some other affection, and not to the love of truth: it being as impossible, that the love of truth should carry my assent above the evidence there is to me that it is true, as that the love of truth should make me assent to any proposition, for the sake of that evidence, which it has not, that it is true; which is, in effect, to love it as a truth, because it is possible or probable that it may not be true. In any truth that gets not possession of our minds by the irresistible light of self-evidence, or by the force of demonstration, the arguments that gain it assent, are the vouchers and gage of its probability to us; and we can receive it for no other than such as they deliver it to our understandings. Whatsoever credit or authority we give to any proposition more than it receives from the principles and proofs it supports itself upon, is owing to our inclinations that way, and is so far a derogation from the love of truth as such: which as it can receive no evidence from our passions or interests, so it should receive no tincture from them.

§ 2. *A forwardness to dictate, from whence.*—The assuming an authority of dictating to others, and a forwardness to prescribe to their opinions, is a constant concomitant of this bias and corruption of our judgments: for how almost can it be otherwise, but that he should be ready to impose on another's belief, who has already imposed on his own? Who can reasonably expect arguments and conviction from him, in dealing with others, whose understanding is not accustomed to them in his dealing with himself? Who does violence to his own faculties tyrannizes over his own mind, and usurps the prerogative that belongs to truth alone, which is to command assent by only its own authority, i. e. by and in proportion to that evidence which it carries with it.

§ 3. *Force of enthusiasm.*—Upon this occasion, I shall take the liberty to consider a third ground of assent, which, with some men, has the

same authority, and is as confidently relied on, as either faith or reason : I mean enthusiasm. Which, laying by reason, would set up revelation without it. Whereby, in effect, it takes away both reason and revelation, and substitutes in the room of it the ungrounded fancies of a man's own brain, and assumes them for a foundation both of opinion and conduct.

§ 4. *Reason and revelation.*—Reason is natural revelation, whereby the eternal Father of light, and Fountain of all knowledge, communicates to mankind that portion of truth which he has laid within the reach of their natural faculties. Revelation is natural reason enlarged by a new set of discoveries, communicated by God immediately, which reason vouches the truth of, by the testimony and proofs it gives, that they come from God. So that he that takes away reason, to make way for revelation, puts out the light of both, and does much what the same as if he would persuade a man to put out his eyes, the better to receive the remote light of an invisible star by a telescope.

§ 5. *Rise of enthusiasm.*—Immediate revelation being a much easier way for men to establish their opinions, and regulate their conduct, than the tedious and not always successful labour of strict reasoning, it is no wonder that some have been very apt to pretend to revelation, and to persuade themselves that they are under the peculiar guidance of heaven, in their actions and opinions, especially in those of them which they cannot account for by the ordinary methods of knowledge, and principles of reason. Hence we see, that in all ages, men, in whom melancholy has mixed with devotion, or whose conceit of themselves has raised them into an opinion of a greater familiarity with God, and a nearer admittance to his favour than is afforded to others, have often flattered themselves with a persuasion of an immediate intercourse with the Deity, and frequent communications from the Divine Spirit. God, I own, cannot be denied to be able to enlighten the understanding by a ray darted into the mind immediately from the fountain of light. This they understand he has promised to do; and who then has so good a title to expect it, as those who are his peculiar people, chosen by him, and depending on him?

§ 6. *Enthusiasm.*—Their minds being thus prepared, whatever groundless opinion comes to settle itself strongly upon their fancies, is an illumination from the Spirit of God, and presently of divine authority: and whatsoever odd action they find in themselves a strong inclination to do, that impulse is concluded to be a call or direction from heaven, and must be obeyed; it is a commission from above, and they cannot err in executing it.

§ 7. This I take to be properly enthusiasm, which, though founded neither on reason nor divine revelation, but rising from the conceits of a warmed or over-weening brain, works yet, where it once gets footing, more powerfully on the persuasions and actions of men, than either of those two, or both together: men being most forwardly obedient to the impulses they receive from themselves; and the whole man is sure to act more vigorously, where the whole man is carried by a natural motion. For strong conceit, like a new principle, carries all easily with it; when got above common sense, and freed from all restraint of reason,

and check of reflection, it is heightened into a divine authority, in concurrence with our own temper and inclination.

§ 8. *Enthusiasm mistaken for seeing and feeling.*—Though the odd opinions and extravagant actions enthusiasm has run men into, were enough to warn them against this wrong principle, so apt to misguide them both in their belief and conduct; yet the love of something extraordinary, the ease and glory it is, to be inspired and be above the common and natural ways of knowledge, so flatters many men's laziness, ignorance, and vanity, that when once they are got into this way of immediate revelation, of illumination without search, and of certainty without proof, and without examination, it is a hard matter to get them out of it. Reason is lost upon them; they are above it: they see the light infused into their understandings, and cannot be mistaken; it is clear and visible there, like the light of bright sunshine; shews itself, and needs no other proof but its own evidence; they feel the hand of God moving them within, and the impulses of the Spirit, and cannot be mistaken in what they feel. Thus they support themselves, and are sure reason hath nothing to do with what they see and feel in themselves; what they have a sensible experience of, admits no doubt, needs no probation. Would he not be ridiculous, who should require to have it proved to him, that the light shines, and that he sees it? It is its own proof, and can have no other. When the Spirit brings light into our minds it dispels darkness. We see it, as we do that of the sun at noon, and need not the twilight of reason to shew it us. This light from heaven is strong, clear, and pure; carries its own demonstration with it; and we may as rationally take a glow-worm to assist us to discover the sun, as to examine the celestial ray by our dim candle, reason.

§ 9. This is the way of talking of these men: they are sure, because they are sure; and their persuasions are right, because they are strong in them. For, when what they say is stripped of the metaphor of seeing and feeling, this is all it amounts to; and yet these similes so impose on them, that they serve them for certainty in themselves, and demonstration to others.

§ 10. *Enthusiasm, how to be discovered.*—But to examine a little soberly this internal light, and this feeling on which they build so much. These men have, they say, clear light, and they see: they have an awakened sense, and they feel: this cannot, they are sure, be disputed them. For when a man says he sees or feels, nobody can deny it him that he does so. But here let me ask: this seeing, is it the perception of the truth of the proposition, or of this, that it is a revelation from God? This feeling, is it a perception of an inclination or fancy to do something, or of the Spirit of God moving that inclination? These are two very different perceptions, and must be carefully distinguished, if we would not impose upon ourselves. I may perceive the truth of a proposition, and yet not perceive that it is an immediate revelation from God. I may perceive the truth of a proposition in Euclid, without its being, or my perceiving it to be, a revelation: nay, I may perceive I came not by this knowledge in a natural way, and so may conclude it revealed, without perceiving that it is a revelation from God; because there be spirits, which, without being divinely commissioned, may ex-

cite those ideas in me, and lay them in such order before my mind, that I may perceive their connexion. So that the knowledge of any proposition coming into my mind, I know not how, is not a perception that it is from God. Much less is a strong persuasion, that it is true, a perception that it is from God, or so much as true. But however it be called light and seeing, I suppose it is at most but belief and assurance: and the proposition taken for a revelation, is not such as they know to be true, but taken to be true. For where a proposition is known to be true, revelation is needless: and it is hard to conceive how there can be a revelation to any one of what he knows already. If therefore it be a proposition which they are persuaded, but do not know, to be true, whatever they may call it, it is not seeing, but believing. For these are two ways, whereby truth comes into the mind, wholly distinct, so that one is not the other. What I see, I know to be so by the evidence of the thing itself; what I believe, I take to be so upon the testimony of another: but this testimony I must know to be given, or else what ground have I of believing? I must see that it is God that reveals this to me, or else I see nothing. The question then here is, How do I know that God is the revealer of this to me; that this impression is made upon my mind by his Holy Spirit, and that therefore I ought to obey it? If I know not this, how great soever the assurance is that I am possessed with, it is groundless; whatever light I pretend to, it is but enthusiasm. For whether the proposition supposed to be revealed, be in itself evidently true, or visibly probable, or by the natural ways of knowledge uncertain, the proposition that must be well grounded, and manifested to be true, is this, that God is the revealer of it; and that what I take to be a revelation, is certainly put into my mind by him, and is not an illusion, dropped in by some other spirit, or raised by my own fancy. For if I mistake not, these men receive it for true, because they presume God revealed it. Does it not then stand them upon, to examine on what grounds they presume it to be a revelation from God? Or else all their confidence is mere presumption; and this light they are so dazzled with, is nothing but an *ignis fatuus*, that leads them continually round in this circle: It is a revelation, because they firmly believe it; and they believe it, because it is a revelation.

§ 11. *Enthusiasm fails of evidence, that the proposition is from God*, —In all that is of divine revelation, there is need of no other proof, but that it is an inspiration from God; for he can neither deceive, nor be deceived. But how shall it be known that any proposition in our minds, is a truth infused by God: a truth that is revealed to us by him, which he declares to us, and therefore we ought to believe? Here it is that enthusiasm fails of the evidence it pretends to. For men thus possessed, boast of a light whereby, they say, they are enlightened, and brought into the knowledge of this or that truth. But if they know it to be a truth, they must know it to be so either by its own self-evidence to natural reason, or by the rational proofs that make it out to be so. If they see and know it to be a truth either of these two ways, they in vain suppose it to be a revelation. For they know it to be true the same way that any other man naturally may know that it is so, without the help of revelation. For thus all the truths, of what kind soever, that men un-

inspired are enlightened with, came into their minds, and are established there. If they say they know it to be true, because it is a revelation from God, the reason is good; but then it will be demanded, how they know it to be a revelation from God? If they say, by the light it brings with it, which shines bright in their minds, and they cannot resist; I beseech them to consider whether this be any more than what we have taken notice of already, viz. that it is a revelation, because they strongly believe it to be true. For all the light they speak of, is but a strong, though ungrounded, persuasion of their own minds, that it is a truth. For rational grounds from proofs that it is a truth, they must acknowledge to have none; for then it is not received as a revelation, but upon the ordinary grounds that other truths are received: and if they believe it to be true, because it is a revelation, and have no other reason for its being a revelation, but because they are fully persuaded, without any other reason, that it is true; they believe it to be a revelation, only because they strongly believe it to be a revelation, which is a very unsafe ground to proceed on, either in our tenets or actions. And what readier way can there be to run ourselves into the most extravagant errors and miscarriages, than thus to set up fancy for our supreme and sole guide, and to believe any proposition to be true, any action to be right, only because we believe it to be so? The strength of our persuasions is no evidence at all of their own rectitude: crooked things may be as stiff and inflexible as straight; and men may be as positive and peremptory in error as in truth. How come else the untractable zealots in different and opposite parties? For if the light, which every one thinks he has in his mind, which in this case is nothing but the strength of his own persuasion, be an evidence that it is from God, contrary opinions may have the same title to be inspirations; and God will be not only the Father of lights, but of opposite and contradictory lights, leading men contrary ways; and contradictory propositions will be divine truths, if an ungrounded strength of assurance be an evidence that any proposition is a divine revelation.

§ 12. *Firmness of persuasion, no proof that any proposition is from God.*—This cannot be otherwise, whilst firmness of persuasion is made a cause of believing, and confidence of being in the right is made an argument of truth. St. Paul himself believed he did well, and that he had a call to it, when he persecuted the Christians, whom he confidently thought in the wrong; but yet it was he, and not they, who were mistaken. Good men, are men still liable to mistakes, and are sometimes warmly engaged in errors, which they take for divine truths, shining in their minds with the clearest light.

§ 13. *Light in the mind, what.*—Light, true light in the mind, is, or can be, nothing else but the evidence of the truth of any proposition; and if it be not a self-evident proposition, all the light it has, or can have, is from the clearness and validity of those proofs upon which it is received. To talk of any other light in the understanding, is to put ourselves in the dark, or in the power of the prince of darkness, and, by our own consent, to give ourselves up to delusion, to believe a lie; for if strength of persuasion be the light which must guide us, I ask, how shall any one distinguish between the delusions of Satan, and the

inspirations of the Holy Ghost? He can transform himself into an angel of light. And they who are led by this sun of the morning, are as fully satisfied of the illumination, i. e. are as strongly persuaded that they are enlightened by the Spirit of God, as any one who is so; they acquiesce and rejoice in it, are acted by it; and nobody can be more sure, nor more in the right (if their own strong belief may be judge), than they.

§ 14. *Revelation must be judged of by reason.*—He, therefore, that will not give himself up to all the extravagancies of delusion and error, must bring this guide of his light within to the trial. God, when he makes the prophet, does not unmake the man; he leaves all his faculties in the natural state, to enable him to judge of his inspirations, whether they be of divine original, or no. When he illuminates the mind with supernatural light, he does not extinguish that which is natural. If he would have us assent to the truth of any proposition, he either evidences that truth by the usual methods of natural reason, or else makes it known to be a truth, which he would have us assent to, by his authority, and convinces us that it is from him, by some marks which reason cannot be mistaken in. Reason must be our last judge and guide in every thing. I do not mean that we must consult reason, and examine whether a proposition revealed from God can be made out by natural principles; and if it cannot, that then we may reject it; but consult it we must, and by it examine whether it be a revelation from God, or no; and if reason finds it to be revealed from God, reason then declares for it, as much as for any other truth, and makes it one of her dictates. Every conceit that thoroughly warms our fancies, must pass for an inspiration, if there be nothing but the strength of our persuasions, whereby to judge of our persuasions. If reason must not examine their truth by something extrinsic to the persuasions themselves, inspirations and delusions, truth and falsehood will have the same measure, and will not be possible to be distinguished.

§ 15. *Belief no proof of revelation.*—If this internal light, or any proposition which under that title we take for inspired, be conformable to the principles of reason, or to the word of God, which is attested revelation, reason warrants it, and we may safely receive it for true, and be guided by it in our belief and actions; if it receive no testimony nor evidence from either of these rules, we cannot take it for a revelation, or so much as for true, till we have some other mark that it is a revelation, besides our believing that it is so. Thus we see the holy men of old, who had revelations from God, had something else besides that internal light of assurance in their own minds, to testify to them that it was from God. They were not left to their own persuasions alone, that those persuasions were from God, but had outward signs to convince them of the Author of those revelations. And when they were to convince others, they had a power given them to justify the truth of their commission from heaven; and by visible signs to assert the divine authority of a message they were sent with. Moses saw the bush burn without being consumed, and heard a voice out of it. This was something besides finding an impulse upon his mind to go to Pharaoh, that he might bring his brethren out of Egypt; and yet he

thought not this enough to authorize him to go with that message, till God, by another miracle of his rod turned into a serpent, had assured him of a power to testify his mission by the same miracle repeated before them whom he was sent to. Gideon was sent by an angel to deliver Israel from the Midianites, and yet he desired a sign to convince him, that this commission was from God. These, and several the like instances to be found amongst the prophets of old, are enough to shew, that they thought not an inward seeing or persuasion of their own minds, without any other proof, a sufficient evidence that it was from God, though the scripture does not every where mention their demanding or having such proofs.

§ 16. In what I have said, I am far from denying that God can, or doth, sometimes enlighten men's minds in the apprehending of certain truths, or excite them to good actions by the immediate influence and assistance of the Holy Spirit, without any extraordinary signs accompanying it. But in such cases, too, we have reason and scripture, unerring rules, to know whether it be from God, or no. Where the truth embraced is consonant to the revelation in the written word of God, or the action conformable to the dictates of right reason, or holy writ, we may be assured that we ran no risk in entertaining it as such; because, though perhaps it be not an immediate revelation from God, extraordinarily operating on our minds, yet we are sure it is warranted by that revelation which he has given us of truth. But it is not the strength of our private persuasion within ourselves, that can warrant it to be a light or motion from heaven; nothing can do that, but the written word of God without us, or that standard of reason which is common to us with all men. Where reason or scripture is expressed for any opinion or action, we may receive it as of divine authority; but it is not the strength of our own persuasions which can by itself give it that stamp. The bent of our own minds may favour it as much as we please; that may shew it to be a foundling of our own, but will by no means prove it to be an offspring of heaven, and of divine original.

CHAP. XX.

OF WRONG ASSENT, OR ERROR.

§ 1. *Causes of error.*—Knowledge being to be had only of visible and certain truth, error is not a fault of our knowledge, but a mistake of our judgment, giving assent to that which is not true.

But if assent be grounded on likelihood, if the proper object and motive of our assent be probability, and that probability consists in what is laid down in the foregoing chapters, it will be demanded, how men come to give their assents contrary to probability? For there is nothing more common than contrariety of opinions; nothing more obvious, than that one man wholly disbelieves what another only doubts of, and a third stedfastly believes, and firmly adheres to. The reasons whereof, though they may be very various, yet, I suppose, may be all reduced to these four: 1. Want of proofs. 2. Want of ability to use them. 3. Want of will to use them. 4. Wrong measures of probability.

§ 2. *First, want of proofs.*—*First*, By want of proofs, I do not mean only the want of those proofs which are no where extant, and so are no where to be had; but the want even of those proofs which are in being, or might be procured. And thus men want proofs, who have not the convenience or opportunity to make experiments and observations themselves, tending to the proof of any proposition: nor likewise the convenience to inquire into, and collect the testimonies of others: and in this state are the greatest part of mankind, who are given up to labour, and enslaved to the necessity of their mean condition, whose lives are worn out only in the provisions for living. These men's opportunities of knowledge and inquiry, are commonly as narrow as their fortunes; and their understandings are but little instructed, when all their whole time and pains are laid out to still the croakings of their own bellies, or the cries of their children. It is not to be expected, that a man who drudges on all his life in a laborious trade, should be more knowing in the variety of things done in the world, than a pack-horse, who is driven constantly forwards and backwards in a narrow lane, and dirty road, only to market, should be skilled in the geography of the country. Nor is it at all more possible, that he who wants leisure, books, and languages, and the opportunity of conversing with variety of men, should be in a condition to collect those testimonies and observations which are in being, and are necessary to make out many, nay, most of the propositions, that, in the societies of men, are judged of the greatest moment; or to find out grounds of assurance so great, as the belief of the points he would build on them, is thought necessary. So that a great part of mankind are, by the natural and unalterable state of things in this world, and the constitution of human affairs, unavoidably given over to invincible ignorance of those proofs on which others build, and which are necessary to establish those opinions; the greatest part of men having much to do to get the means of living, are not in a condition to look after those of learned and laborious inquiries.

§ 3. *Objection, What shall become of those who want them, answered.*—What shall we say, then? Are the greatest part of mankind, by the necessity of their condition, subjected to unavoidable ignorance in those things which are of greatest importance to them (for of these it is obvious to inquire)? Have the bulk of mankind no other guide but accident and blind chance, to conduct them to their happiness or misery? Are the current opinions, and licensed guides, of every country, sufficient evidence and security to every man, to venture his greatest concerns on; nay, his everlasting happiness or misery? Or can those be the certain and infallible oracles and standards of truth, which teach one thing in Christendom, another in Turkey? Or shall a poor countryman be eternally happy, for having the chance to be born in Italy; or a day-labourer be unavoidably lost, because he had the ill-luck to be born in England? How ready some men may be to say some of these things, I will not here examine: but this I am sure, that men must allow one or other of these to be the true (let them choose which they please), or else grant, that God has furnished men with faculties sufficient to direct them in the way they should take, if they will but seriously employ them that way, when their ordinary vocations allow them the

leisure. No man is so wholly taken up with the attendance on the means of living, as to have no spare time at all to think of his soul, and inform himself in matters of religion. Where men as intent upon this, as they are on things of lower concernment, there are none so enslaved to the necessities of life, who might not find many vacancies that might be husbanded to this advantage of their knowledge.

§ 4. *People hindered from inquiry.*—Besides those whose improvements and informations are straitened by the narrowness of their fortunes, there are others, whose largeness of fortune would plentifully enough supply books, and other requisites, for clearing of doubts, and discovering of truth; but they are cooped in close by the laws of their countries, and the strict guards of those whose interest it is to keep them ignorant, lest, knowing more, they should believe the less in them. These are as far, nay, farther, from the liberty and opportunities of a fair inquiry, than those poor and wretched labourers we before spoke of; and, however they may seem high and great, are confined to narrowness of thought, and enslaved in that which should be the freest part of man, their understandings. This is generally the case of all those who live in places where care is taken to propagate truth without knowledge, where men are forced, at a venture, to be of the religion of the country, and must therefore swallow down opinions, as silly people do empiric pills, without knowing what they are made of, or how they will work, and have nothing to do but believe that they will do the cure; but in this, they are much more miserable than they, in that they are not at liberty to refuse swallowing what perhaps they had rather let alone; or to choose the physician, to whose conduct they would trust themselves.

§ 5. *Secondly, want of skill to use them.*—*Secondly,* Those who want skill to use those evidences they have of probabilities, who cannot carry a train of consequences in their heads, nor weigh exactly the preponderancy of contrary proofs and testimonies, making every circumstance its due allowance, may be easily misled to assent to positions that are not probable. There are some men of one, some but of two, syllogisms, and no more; and others that can advance but one step farther. These cannot always discern that side on which the strongest proofs lie; cannot constantly follow that which in itself is the more probable opinion. Now, that there is such a difference between men, in respect of their understandings, I think nobody, who has had any conversation with his neighbours, will question, though he never was at Westminster-Hall, or the Exchange, on the one hand; nor at almshouses, or Bedlam, on the other: which great difference in men's intellects, whether it rises from any defect in the organs of the body, particularly adapted to thinking; or in the dulness or untractableness of those faculties, for want of use; or, as some think, in the natural differences of men's souls themselves; or some, or all of these together, it matters not here to examine. Only this is evident, that there is a difference of degrees in men's understandings, apprehensions, and reasonings, to so great a latitude, that one may, without doing injury to mankind, affirm, that there is a greater distance between some men and others, in this respect, than between some men and some beasts. But

how this comes about, is a speculation, though of great consequence, yet not necessary to our present purpose.

§ 6. *Thirdly, want of will to use them.*—*Thirdly*, There are another sort of people that want proofs, not because they are out of their reach, but because they will not use them; who, though they have riches and leisure enough, and want neither parts nor other helps, are yet never the better for them. Their hot pursuit of pleasure, or constant drudgery in business, engages some men's thoughts elsewhere; laziness and oscitancy in general, or a particular aversion for books, study, and meditation, keep others from any serious thoughts at all; and some out of fear, that an impartial inquiry would not favour those opinions which best suit their prejudices, lives, and designs, content themselves, without examination, to take upon trust what they find convenient, and in fashion. Thus most men, even of those that might do otherwise, pass their lives without an acquaintance with, much less a rational assent to, probabilities they are concerned to know, though they lie so much within their view, that to be convinced of them, they need but turn their eyes that way. We know some men will not read a letter, which is supposed to bring ill news; and many men forbear to cast up their accounts, or so much as think upon their estates, who have reason to fear their affairs are in no very good posture. How men, whose plentiful fortunes allow them leisure to improve their understandings, can satisfy themselves with a lazy ignorance, I cannot tell; but methinks they have a low opinion of their souls, who lay out all their incomes in provisions for the body, and employ none of it to procure the means and helps of knowledge; who take great care to appear always in a neat and splendid outside, and would think themselves miserable in coarse clothes, or a patched coat, and yet contentedly suffer their minds to appear abroad in a piebald livery of coarse patches, and borrowed shreds, such as it has pleased chance, or their country tailor (I mean the common opinion of those they have conversed with), to clothe them in. I will not here mention how unreasonable this is for men that ever think of a future state, and their concernment in it, which no rational man can avoid to do sometimes; nor shall I take notice what a shame and confusion it is, to the greatest contemners of knowledge, to be found ignorant in things they are concerned to know. But this, at least, is worth the consideration of those who call themselves gentlemen, that however they may think credit, respect, power, and authority, the concomitants of their birth and fortune, yet they will find all these still carried away from them by men of lower condition, who surpass them in knowledge. They who are blind, will always be led by those that see, or else fall into the ditch: and he is certainly the most subjected, the most enslaved, who is so in his understanding. In the foregoing instances, some of the causes have been shewn of wrong assent; and how it comes to pass, that probable doctrines are not always received with an assent proportionable to the reasons which are to be had for their probability: but hitherto we have considered only such probabilities, whose proofs do exist, but do not appear to him who embraces the error.

§ 7. *Fourthly, wrong measures of probability; whereof*—*Fourthly*, There remains yet the last sort, who, even where the real probabilities

appear, and are plainly laid before them, do not admit of the conviction, nor yield unto manifest reasons, but do either ἐπέχειν, suspend their assent, or give it to the less probable opinion. And to this danger are those exposed, who have taken up wrong measures of probability; which are, 1. Propositions that are not in themselves certain and evident, but doubtful and false, taken up for principles. 2. Received hypotheses. 3. Predominant passions or inclinations. 4. Authority.

§ 8. *First, doubtful propositions taken for principles.*—*First,* The first and firmest ground of probability, is the conformity any thing has to our own knowledge; especially that part of our knowledge which we have embraced, and continue to look on as principles. These have so great an influence upon our opinions, that it is usually by them we judge of truth, and measure probability to that degree, that what is inconsistent with our principles, is so far from passing for probable with us, that it will not be allowed possible. The reverence borne to these principles is so great, and their authority so paramount to all other, that the testimony not only of other men, but the evidence of our own senses, are often rejected, when they offer to vouch any thing contrary to these established rules. How much the doctrine of innate principles, and that principles are not to be proved or questioned, has contributed to this, I will not here examine. This I readily grant, that one truth cannot contradict another; but withal, I take leave also to say, that every one ought very carefully to beware what he admits for a principle, to examine it strictly, and see whether he certainly knows it to be true of itself, by its own evidence, or whether he does only with assurance believe it to be so upon the authority of others; for he hath a strong bias put into his understanding, which will unavoidably misguide his assent, who hath imbibed wrong principles, and has blindly given himself up to the authority of any opinion in itself not evidently true.

§ 9. There is nothing more ordinary, than children's receiving into their minds propositions (especially about matters of religion) from their parents, nurses, or those about them; which being insinuated into their unwary, as well as unbiassed, understandings, and fastened by degrees, are at last (equally, whether true or false) riveted there, by long custom and education, beyond all possibility of being pulled out again. For men, when they are grown up, reflecting upon their opinions, and finding those of this sort to be as ancient in their minds as their very memories, not having observed their early insinuation, nor by what means they got them, they are apt to reverence them as sacred things, and not to suffer them to be profaned, touched, or questioned: they look on them as the Urim and Thummim set up in their minds immediately by God himself, to be the great and unerring deciders of truth and falsehood, and the judges to which they are to appeal in all manner of controversies.

§ 10. This opinion of his principles (let them be what they will) being once established in any one's mind, it is easy to be imagined what reception any proposition shall find, how clearly soever proved, that shall invalidate their authority, or at all thwart with these internal oracles: whereas, the grossest absurdities and improbabilities, being but agreeable to such principles, go down glibly, and are easily digested.

The great obstinacy that is to be found in men firmly believing quite contrary opinions, though many times equally absurd in the various religions of mankind, are as evident a proof, as they are an unavoidable consequence, of this way of reasoning from received traditional principles. So that men will disbelieve their own eyes, renounce the evidence of their senses, and give their own experience the lie, rather than admit of any thing disagreeing with these sacred tenets. Take an intelligent Romanist, that, from the first dawning of any notions in his understanding, hath had this principle constantly inculcated, viz. that he must believe as the church (i. e. those of his communion) believes, or that the Pope is infallible; and this he never so much as heard questioned, till at forty or fifty years old he met with one of other principles; how is he prepared easily to swallow, not only against all probability, but even the clear evidence of his senses, the doctrine of transubstantiation! This principle has such an influence on his mind, that he will believe that to be flesh, which he sees to be bread. And what way will you take to convince a man of any improbable opinion he holds, who with some philosophers, hath laid down this as a foundation of reasoning, that he must believe his reason (for so men improperly call arguments drawn from their principles) against his senses? Let an enthusiast be principled, that he or his teacher is inspired, and acted by an immediate communication of the Divine Spirit, and you in vain bring the evidence of clear reasons against his doctrine. Whoever therefore have imbibed wrong principles, are not, in things inconsistent with these principles, to be moved by the most apparent and convincing probabilities, till they are so candid and ingenuous to themselves as to be persuaded to examine even those very principles, which many never suffer themselves to do.

§ 11. *Secondly, received hypotheses.*—*Secondly*, Next to these are men whose understandings are cast into a mould, and fashioned just to the size of a received hypothesis. The difference between these and the former is, that they will admit of matter of fact, and agree with dissenters in that; but differ only in assigning of reasons, and explaining the manner of operation. These are not at that open defiance with their senses as the former; they can endure to hearken to their information a little more patiently; but will by no means admit of their reports in the explanation of things; nor be prevailed on by probabilities, which would convince them, that things are not brought about just after the same manner that they have decreed within themselves that they are. Would it not be an insufferable thing, for a learned professor, and that which his scarlet would blush at, to have his authority of forty years' standing, wrought out of hard rock, Greek and Latin, with no small expense of time and candle, and confirmed by general tradition, and a reverend beard, in an instant overturned by an upstart novelist? Can any one expect that he should be made to confess, that what he taught his scholars thirty years ago, was all error and mistake; and that he sold them hard words and ignorance at a very dear rate? What probabilities, I say, are sufficient to prevail in such a case? And whoever, by the most cogent arguments, will be prevailed with to disrobe himself at once of all his old opinions and pretences to knowledge and learning,

which with hard study he hath all his time been labouring for; and turn himself out stark naked, in quest afresh of new notions? All the arguments that can be used, will be as little able to prevail, as the wind did with the traveller, to part with his cloak, which he held only the faster. To this of wrong hypothesis, may be reduced the errors, that may be occasioned by a true hypothesis, or right principles, but not rightly understood. There is nothing more familiar than this. The instances of men contending for different opinions, which they all derive from the infallible truth of the scripture, are an undeniable proof of it. All that call themselves Christians allow the text that says, *μετανοείτε*, to carry in it the obligation to a very weighty duty. But yet how very erroneous will one of their practices be, who understanding nothing but the French, take this rule with one translation to be *repentez vous*, repent; or with the other, *faites penitence*, do penance!

§ 12. *Thirdly, predominant passions.*—*Thirdly*, Probabilities, which cross men's appetites, and prevailing passions, run the same fate. Let ever so much probability hang on one side of a covetous man's reasoning, and money on the other, it is easy to foresee which will outweigh. Earthly minds, like mud walls, resist the strongest batteries; and though, perhaps, sometimes the force of a clear argument may make some impression, yet they nevertheless stand firm, and keep out the enemy truth, that would captivate or disturb them. Tell a man, passionately in love, that he is jilted; bring a score of witnesses of the falsehood of his mistress; it is ten to one but three kind words of her's shall invalidate all their testimonies. *Quod volumus, facile credimus*; what suits our wishes, is forwardly believed; is, I suppose, what every one hath more than once experimented: and though men cannot always openly gainsay or resist the force of manifest probabilities that make against them, yet yield they not to the argument. Not but that it is the nature of the understanding constantly to close with the more probable side; but yet a man hath a power to suspend and restrain its inquiries, and not permit a full and satisfactory examination, as far as the matter in question is capable, and will bear it to be made. Until that be done, there will be always these two ways left of evading the most apparent probabilities.

§ 13. *The means of evading probabilities: First, supposed fallacy.*—*First*, That the arguments being (as for the most part they are) brought in words, there may be a fallacy latent in them; and the consequences being, perhaps, many in train, they may be some of them incoherent. There are very few discourses so short, clear, and consistent, to which most men may not, with satisfaction enough to themselves, raise this doubt; and from whose conviction they may not, without reproach of disingenuity or unreasonableness, set themselves free with the old reply, *Non persuadebis, etiamsi persuaseris*: Though I cannot answer, I will not yield.

§ 14. *Secondly, supposed arguments for the contrary.*—*Secondly*, Manifest probabilities may be evaded, and the assent withheld upon this suggestion, that I know not yet all that may be said on the contrary side. And, therefore, though I be beaten, it is not necessary I should yield, not knowing what forces there are in reserve behind. This is a

refuge against conviction, so open and so wide, that it is hard to determine when a man is quite out of the verge of it.

§ 15. *What probabilities determine the assent.*—But yet there is some end of it; and a man having carefully inquired into all the grounds of probability and unlikeliness, done his utmost to inform himself in all particulars fairly, and cast up the sum total on both sides, may in most cases come to acknowledge, upon the whole matter, on which side the probability rests; wherein some proofs in matter of reason, being suppositions upon universal experience, are so cogent and clear, and some testimonies in matter of fact so universal, that he cannot refuse his assent. So that, I think, we may conclude, that in propositions, where though the proofs in view are of most moment, yet there are sufficient grounds to suspect, that there is either fallacy in words, or certain proofs as considerable, to be produced on the contrary side; there assent, suspense, or dissent, are often voluntary actions; but where the proofs are such as make it highly probable, and there is not sufficient ground to suspect that there is either fallacy of words (which sober and serious consideration may discover), nor equally valid proofs yet undiscovered, latent on the other side (which also the nature of the thing may, in some cases, make plain to a considerate man), there, I think, a man who has weighed them, can scarce refuse his assent to the side on which the greater probability appears. Whether it be probable, that a promiscuous jumble of printing letters should often fall into a method and order, which would stamp on paper a coherent discourse; or that a blind fortuitous concourse of atoms, not guided by an understanding agent, should frequently constitute the bodies of any species of animals: in these and the like cases, I think nobody that considers them, can be one jot at a stand which side to take, nor at all waver in his assent. Lastly, when there can be no supposition (the thing in its own nature indifferent, and wholly depending upon the testimony of witnesses), that there is as fair testimony against, as for, the matter of fact attested; which by inquiry is to be learned, v. g. whether there was seventeen hundred years ago, such a man at Rome as Julius Cæsar; in all such cases, I say, I think it is not in any rational man's power to refuse his assent; but that it necessarily follows, and closes with such probabilities. In other less clear cases, I think it is in man's power to suspend his assent; and perhaps content himself with the proofs he has, if they favour the opinion that suits with his inclination or interest, and so stop from farther search. But that a man should afford his assent to that side on which the less probability appears to him, seems to me utterly impracticable, and as impossible as it is to believe the same thing probable and improbable at the same time.

§ 16. *Where it is in our power to suspend it.*—As knowledge is no more arbitrary than perception; so, I think, assent is no more in our power than knowledge. When the agreement of any two ideas appears to our minds, whether immediately, or by the assistance of reason, I can no more refuse to perceive, no more avoid knowing, it, than I can avoid seeing those objects which I turn my eyes to, and look on, in daylight: and what, upon full examination, I find the most probable, I

cannot deny my assent to. But though we cannot hinder our knowledge, where the agreement is once perceived; nor our assent, where the probability manifestly appears upon due consideration of all the measures of it; yet we can hinder both knowledge and assent, by stopping our inquiry, and not employing our faculties in the search of any truth. If it were not so, ignorance, error, or infidelity, could not in any case be a fault. Thus in some cases we can prevent or suspend our assent, but can a man, versed in modern, or ancient history, doubt whether there is such a place as Rome, or whether there was such a man as Julius Cæsar? Indeed, there are millions of truths, that a man is not, or may not, think himself concerned to know; as whether our King Richard the Third was crooked, or no? or whether Roger Bacon was a mathematician, or a magician? In these, and such like cases, where the assent, one way or other, is of no importance to the interest of any one; no action, no concernment, of his following or depending thereon; there it is not strange that the mind should give itself up to the common opinion, or render itself to the first comer. These and the like opinions, are of so little weight and moment, that, like motes in the sun, their tendencies are very rarely taken notice of. They are there, as it were, by chance, and the mind lets them float at liberty. But where the mind judges that the proposition has concernment in it; where the assent or not assenting is thought to draw consequences of moment after it; and good and evil to depend on choosing or refusing the right side, and the mind sets itself seriously to inquire, and examine, the probability; there, I think, it is not in our choice to take which side we please, if manifest odds appear on either. The greater probability, I think, in that case, will determine the assent; and a man can no more avoid assenting, or taking it to be true, where he perceives the greater probability, than he can avoid knowing it to be true, where he perceives the agreement or disagreement of any two ideas.

If this be so, the foundation of error will lie in wrong measures of probability; as the foundation of vice in wrong measures of good.

§ 17. *Fourthly, authority.*—*Fourthly*, The fourth and last wrong measure of probability I shall take notice of, and which keeps in ignorance or error more people than all the other together, is that which I mentioned in the foregoing chapter; I mean, the giving up our assent to the common received opinions, either of our friends or party, neighbourhood or country. How many men have no other ground for their tenets, than the supposed honesty, or learning, or number of those of the same profession? As if honest or bookish men could not err; or truth were to be established by the vote of the multitude; yet this, with most men, serves the turn. The tenet has had the attestation of reverend antiquity; it comes to me with the passport of former ages; and therefore I am secure in the reception I give it; other men have been, and are, of the same opinion (for that is all is said), and therefore it is reasonable for me to embrace it. A man may more justifiably throw up cross and pile for his opinions, than take them up by such measures. All men are liable to error, and most men are, in many points, by passion or interest, under temptation to it. If we could but see the secret motives that influenced the men of name and learning in the world, and the leaders

of parties, we should not always find, that it was the embracing of truth for its own sake, that made them espouse the doctrines they owned and maintained. This, at least, is certain; there is not an opinion so absurd, which a man may not receive upon this ground. There is no error to be named, which has not had its professors; and a man shall never want crooked paths to walk in, if he thinks that he is in the right way, wherever he has the footsteps of others to follow.

§ 18. *Men not in so many errors as imagined.*—But notwithstanding the great noise made in the world about errors and opinions, I must do mankind that right, as to say, there are not so many men in errors, and wrong opinions as is commonly supposed. Not that I think, they embrace the truth; but, indeed, because concerning those doctrines they keep such a stir about, they have no thought, no opinion, at all. For if any one should a little catechise the greatest part of the partizans of most of the sects in the world, he would not find, concerning those matters they are so zealous for, that they have any opinions of their own: much less would he have reason to think, that they took them upon the examination of arguments, and appearance of probability. They are resolved to stick to a party that education or interest has engaged them in; and there, like the common soldiers of an army, shew their courage and warmth as their leaders direct, without ever examining, or so much as knowing the cause they contend for. If a man's life shews that he has no serious regard for religion; for what reason should we think, that he beats his head about the opinions of his church, and troubles himself to examine the grounds of this or that doctrine? It is enough for him to obey his leaders, to have his hand and his tongue ready for the support of the common cause, and thereby approve himself to those who can give him credit, preferment, or protection, in that society. Thus men become professors of, and combatants for, those opinions they were never convinced of, nor proselytes to; no, nor ever had so much as floating in their heads: and though one cannot say there are fewer improbable or erroneous opinions in the world than there are, yet it is certain, there are fewer that actually assent to them, and mistake them for truths, than is imagined.

CHAP. XXI.

OF THE DIVISION OF THE SCIENCES.

§ 1. *Three sorts.*—All that can fall within the compass of human understanding, being either, *First*, The nature of things, as they are in themselves, their relations, and their manner of operation: or, *Secondly*, That which man himself ought to do, as a rational and voluntary agent, for the attainment of any end, especially happiness: or, *Thirdly*, The ways and means whereby the knowledge of both the one and the other of these is attained and communicated: I think science may be divided properly into these three sorts.

§ 2. *First, physica.*—*First*, The knowledge of things, as they are in their own proper beings, their constitution, properties, and operations, whereby I mean not only matter and body, but spirits also, which have

their proper natures, constitutions, and operations, as well as bodies. This, in a little more enlarged sense of the word, I call *Φυσικὴ*, or natural philosophy. The end of this is bare speculative truth; and whatsoever can afford the mind of man any such, falls under this branch, whether it be God himself, angels, spirits, bodies, or any of their affections, as number and figure, &c.

§ 3. *Secondly, practica.*—*Secondly, Πρακτικὴ*, the skill of right applying our own powers and actions, for the attainment of things good and useful. The most considerable under this head, is ethics, which is the seeking out those rules and measures of human actions, which lead to happiness, and the means to practise them. The end of this is not bare speculation, and the knowledge of truth; but right, and a conduct suitable to it.

§ 4. *Thirdly, Σημειωτικὴ.*—The third branch may be called *Σημειωτικὴ*, or the doctrine of signs, the most usual whereof being words, it is aptly enough termed also *Λογικὴ*, logic; the business whereof is to consider the nature of signs the mind makes use of for the understanding of things, or conveying its knowledge to others. For since the things the mind contemplates, are none of them, besides itself, present to the understanding, it is necessary that something else, as a sign or representation of the thing it considers, should be present to it: and these are ideas. And because the scene of ideas that makes one man's thoughts, cannot be laid open to the immediate view of another, nor laid up any where but in memory, a no very sure repository; therefore, to communicate our thoughts to one another, as well as record them for our own use, signs of our ideas are also necessary. Those which men have found most convenient, and therefore generally make use of, are articulate sounds. The consideration then of ideas and words, as the great instruments of knowledge, makes no despicable part of their contemplation, who would take a view of human knowledge in the whole extent of it. And perhaps if they were distinctly weighed, and duly considered, they would afford us another sort of logic and critic, than what we have been hitherto acquainted with.

§ 5. *This is the first division of the objects of knowledge.*—This seems to me the first and most general, as well as natural, division of the objects of our understanding. For a man can employ his thoughts about nothing, but either the contemplation of things themselves, for the discovery of truth; or about the things in his own power, which are his own actions, for the attainment of his own ends; or the signs the mind makes use of, both in the one and the other, and the right ordering of them for its clearer information. All which three, viz. things as they are in themselves knowable; actions as they depend on us, in order to happiness; and the right use of signs in order to knowledge, being *toto calo* different, they seemed to me to be the three great provinces of the intellectual world, wholly separate and distinct one from another.

SOME THOUGHTS
CONCERNING
READING AND STUDY
FOR A
GENTLEMAN.

SOME THOUGHTS

CONCERNING

READING AND STUDY

FOR A

GENTLEMAN.

READING is for the improvement of the understanding.

The improvement of the understanding is for two ends; first, for our own increase of knowledge; secondly, to enable us to deliver and make out that knowledge to others.

The latter of these, if it be not the chief end of study in a gentleman; yet it is at least equal to the other, since the greatest part of his business and usefulness in the world is by the influence of what he says or writes to others.

The extent of our knowledge cannot exceed the extent of our ideas. Therefore he, who would be universally knowing, must acquaint himself with the objects of all sciences. But this is not necessary to a gentleman, whose proper calling is the service of his country; and so is most properly concerned in moral and political knowledge; and thus the studies, which more immediately belong to his calling are those which treat of virtues and vices of civil society, and the arts of government; and will take in also law and history.

It is enough for a gentleman to be furnished with the ideas belonging to his calling, which he will find in the books that treat of the matters above-mentioned.

But the next step towards the improvement of his understanding must be, to observe the connexion of these ideas in the propositions which those books hold forth, and pretend to teach as truths; which till a man can judge whether they be truths or no, his understanding is but little improved: and he doth but think and talk after the books that he hath read, without having any knowledge thereby. And thus men of much reading are greatly learned, but may be little knowing.

The third and last step, therefore, in improving the understanding, is to find out upon what foundation any proposition advanced bottoms; and to observe the connexion of the intermediate ideas, by which it is joined to that foundation upon which it is erected, or that

principle from which it is derived. This, in short, is right reasoning; and by this way alone true knowledge is to be got by reading and studying.

When a man, by use, hath got this faculty of observing and judging of the reasoning and coherence of what he reads, and how it proves what it pretends to teach; he is then, and not till then, in the right way of improving his understanding, and enlarging his knowledge by reading.

But that, as I have said, being not all that a gentleman should aim at in reading, he should farther take care to improve himself in the art also of speaking, that so he may be able to make the best use of what he knows.

The art of speaking well consists in two things, viz. perspicuity and right reasoning.

Perspicuity consists in the using of proper terms for the ideas or thoughts which he would have pass from his own mind into that of another man. It is this that gives them an easy entrance; and it is with delight that men hearken to those whom they easily understand; whereas what is obscurely said, dying as it is spoken, is usually not only lost, but creates a prejudice in the hearer, as if he that spoke knew not what he said, or was afraid to have it understood.

The way to obtain this, is to read such books as are allowed to be writ with the greatest clearness and propriety, in the language that a man uses. An author excellent in this faculty, as well as several others, is Dr. Tillotson, late archbishop of Canterbury, in all that is published of his. I have chosen rather to propose this pattern, for the attainment of the art of speaking clearly, than those who give rules about it; since we are more apt to learn by example than by direction. But if any one hath a mind to consult the masters in the art of speaking and writing, he may find in Tully *De Oratore*, and another treatise of his called *Orator*; and in Quintilian's *Institutions*, and Boileau's *Traité du Sublime*,* instructions concerning this and the other parts of speaking well.

Besides perspicuity, there must be also right reasoning; without which, perspicuity serves but to expose the speaker. And for the attaining of this, I should propose the constant reading of Chillingworth, who, by his example, will teach both perspicuity, and the way of right reasoning, better than any book that I know; and therefore will deserve to be read upon that account over and over again; not to say any thing of his argument.

Besides these books in English, Tully, Terence, Virgil, Livy, and Cæsar's Commentaries, may be read to form one's mind to a relish of a right way of speaking and writing.

The books I have hitherto mentioned have been in order only to writing and speaking well; not but that they will deserve to be read upon other accounts.

The study of morality I have above mentioned as that that becomes a gentleman; not barely as a man, but in order to his business as a

* That treatise is a translation from Longinus.

gentleman. Of this there are books enough writ both by ancient and modern philosophers; but the morality of the gospel doth so exceed them all, that, to give a man a full knowledge of true morality, I shall send him to no other book but the New Testament. But if he hath a mind to see how far the heathen world carried that science, and whereon they bottomed their ethics, he will be delightfully and profitably entertained in Tully's Treatises *De Officiis*.

Politics contains two parts, very different the one from the other. The one, containing the original of societies, and the rise and extent of political power; the other, the art of governing men in society.

The first of these hath been so bandied amongst us for these sixty years backward, that one can hardly miss books of this kind. Those which I think are most talked of in English, are the first book of Mr. Hooker's Ecclesiastical Polity, and Mr. Algernon Sidney's Discourses concerning Government. The latter of these I never read. Let me here add, Two Treatises of Government, printed in 1690;* and a Treatise of Civil Polity, printed this year.† To these one may add, Puffendorf *De Officio Hominis et Civis*, and *De Jure Naturali et Gentium*; which last is the best book of that kind.

As to the other part of politics, which concerns the art of government, that, I think, is best to be learned by experience and history, especially that of a man's own country. And therefore I think an English gentleman should be well versed in the history of England, taking his rise as far back as there are any records of it; joining with it the laws that were made in the several ages, as he goes along in his history; that he may observe from thence the several turns of state, and how they have been produced. In Mr. Tyrrel's History of England he will find all along those several authors which have treated of our affairs, and which he may have recourse to, concerning any point which either his curiosity or judgment shall lead him to inquire into.

With the history, he may also do well to read the ancient lawyers; such as Bracton, Fleta, Henningham, Mirror of Justice, my Lord Coke's Second Institutes, and the *Modus tenendi Parliamentum*; and others of that kind which he may find quoted in the late controversies between Mr. Petit, Mr. Tyrrel, Mr. Atwood, &c. with Dr. Brady; as also, I suppose, in Sedler's Treatise of Rights of the Kingdom, and Customs of our Ancestors, whereof the first edition is the best; wherein he will find the ancient constitution of the government of England.

There are two volumes of State Tracts printed since the Revolution, in which there are many things relating to the government of England.‡

* These two treatises are written by Mr. Locke himself.

† Civil Polity. A Treatise concerning the Nature of Government, &c. London, 1703, in 8vo. Written by Peter Paxton, M. D.

‡ We have now two collections of State Tracts; one in two volumes in folio, printed in 1689 and 1692, contains Several Treatises relating to the Government from the year 1660 to 1689; and the other, in three volumes in folio, printed in 1705, 1706, and 1707, is a

As for general history, Sir Walter Raleigh and Dr. Howel are books to be had. He, who hath a mind to launch farther into that ocean, may consult Whear's *Methodus legendi Historias*, of the last edition, which will direct him to the authors he is to read, and the method wherein he is to read them.

To the reading of history, chronology and geography are absolutely necessary.

In geography, we have two general ones in English, Heylin and Moll; which is the best of them I know not, having not been much conversant in either of them. But the last I should think to be of most use; because of the new discoveries that are made every day, tending to the perfection of that science. Though, I believe, that the countries, which Heylin mentions, are better treated of him, bating what new discoveries since his time have added.

These two books contain geography in general; but whether an English gentleman would think it worth his time to bestow much pains upon that, though without it he cannot well understand a Gazette, it is certain he cannot well be without Camden's *Britannia*, which is much enlarged in the last English edition. A good collection of maps is also necessary.

To geography, books of travels may be added. In that kind, the collections made by our countrymen, Hackluyt and Purchas, are very good. There is also a very good collection made by Thevenot in folio, in French; and by Ramuzio, in Italian; whether translated into English or no, I know not. There are also several good books of travels of Englishmen published, as Sandys, Roe, Brown, Gage, and Dampier.

There are also several voyages in French, which are very good, as Pyrrard,* Bergeron,† Sagard,‡ Bernier,§ &c.: whether all of them are translated into English, I know not.

There is at present a very good Collection of Voyages and Travels, never before in English, and such as are out of print; now printing by Mr. Churchill.||

There are besides these a vast number of other travels; a sort of books that have a very good mixture of delight and usefulness. To set them down all would take up too much time and room. Those I have mentioned are enough to begin with.

As to chronology, I think Helvicus the best for common use; which is not a book to be read, but to lie by, and be consulted upon

Collection of Tracts, published on Occasion of the late Revolution in 1688, and during the Reign of King William III. These collections might have been made more complete and more convenient; especially the first, which is extremely defective and incorrect.

* Voyage de François Pyrrard de Laval. Contenant sa Navigation aux Indes Orientales, Maldives, Moluques, Brésil. Paris, 1619, 8vo. 3d edit.

† Relation des Voyages en Tartarie, &c. Le tout recueilli par Pierre Bergeron. Paris, 1634, 8vo.

‡ Le Grand Voyage des Hurons, situés en l'Amerique, &c. par F. Gab. Sagard Theodat. Paris, 1632, 8vo.

§ Memoires de l'Empire du Grand Mogol, &c. par François Bernier. Paris, 1670 et 1671, 3 vols. in 12mo.

|| That collection of voyages and travels was published an. 1704, in 4 vols. in fol.

occasion. He that hath a mind to look farther into chronology, may get Tallent's Tables, and Strauchius's *Breviarium Temporum*, and may to those add Scaliger *De Emendatione Temporum*, and Petavius, if he hath a mind to engage deeper in that study.

Those, who are accounted to have writ best particular parts of our English history, are Bacon, of Henry VII. and Herbert, of Henry VIII. Daniel also is commended; and Burnet's *History of the Reformation*.

Mariana's *History of Spain*, and Thuanus's *History of his Own Time*, and Philip de Comines, are of great and deserved reputation.

There are also several French and English memoirs and collections, such as La Rochefoucault, Melvil, Rushworth, &c. which give a great light to those who have a mind to look into what hath passed in Europe this last age.

To fit a gentleman for the conduct of himself, whether as a private man, or as interested in the government of his country, nothing can be more necessary than the knowledge of men; which, though it be to be had chiefly from experience, and next to that, from a judicious reading of history; yet there are books that of purpose treat of human nature, which help to give an insight into it. Such are those treating of the passions, and how they are moved; whereof Aristotle in his second book of *Rhetoric* hath admirably discoursed, and that in a little compass. I think this *Rhetoric* is translated into English; if not, it may be had in Greek and Latin together.

La Bruyere's *Characters* are also an admirable piece of painting; I think it is also translated out of French into English.

Satirical writings also, such as Juvenal, and Persius, and above all Horace; though they paint the deformities of men, yet they thereby teach us to know them.

There is another use of reading, which is for diversion and delight. Such are poetical writings, especially dramatic, if they be free from profaneness, obscenity, and what corrupts good manners; for such pitch should not be handled.

Of all the books of fiction, I know none that equals Cervantes's *History of Don Quixote* in usefulness, pleasantry, and a constant *lecorum*. And indeed no writings can be pleasant, which have not nature at the bottom, and are not drawn after her copy.

There is another sort of books, which I had almost forgot, with which a gentleman's study ought to be well furnished, viz. dictionaries of all kinds. For the Latin tongue, Littleton, Cooper, Calepin, and Robert Stephens's *Thesaurus Linguae Latinae*, and Vossii *Etymologicum Linguae Latinae*; Skinner's *Lexicon Etymologicum* is an excellent one of that kind, for the English tongue. Cowel's *Interpreter* is useful for the law terms. Spelman's *Glossary* is a very useful and learned book. And Selden's *Titles of Honour* a gentleman should not be without. Baudrand hath a very good *Geographical Dictionary*. And there are several historical ones, which are of use; as Lloyd's, Hoffman's, Moreri's. And Bayle's incomparable dic-

tionary is something of the same kind. He that hath occasion to look into books written in Latin since the decay of the Roman empire, and the purity of the Latin tongue, cannot be well without Du Cange's *Glossarium mediæ et infimæ Latinitatis*.

Among the books above set down, I mentioned Vossius's *Etymologicum Linguae Latinæ*; all his works are lately printed in Holland in six tomes. They are fit books for a gentleman's library, containing very learned discourses concerning all the sciences.

END OF THOUGHTS CONCERNING READING AND STUDY.

OF THE
CONDUCT
OF THE
UNDERSTANDING.

OF THE
CONDUCT
OF THE
UNDERSTANDING.

Quid tam temerarium tamque indignum sapientis gravitate atque constantia, quam aut falsum sentire, aut quod non satis explorate perceptum sit, et cognitum, sine ulla dubitatione defendere?—*Cic. de Natura Deorum, lib. 1.*

§ 1. *Introduction.*—THE last resort a man has recourse to in the conduct of himself is his understanding; for though we distinguish the faculties of the mind, and give the supreme command to the will, as to an agent; yet the truth is, the man which is the agent determines himself to this or that voluntary action, upon some precedent knowledge, or appearance of knowledge, in the understanding. No man ever sets himself about any thing but upon some view or other, which serves him for a reason for what he does: and whatsoever faculties he employs, the understanding, with such light as it has, well or ill informed, constantly leads; and by that light, true or false, all his operative powers are directed. The will itself, how absolute and uncontrollable soever it may be thought, never fails in its obedience to the dictates of the understanding. Temples have their sacred images, and we see what influence they have always had over a great part of mankind. But, in truth, the ideas and images in men's minds are the visible powers that constantly govern them, and to these they all universally pay a ready submission. It is therefore of the highest concernment that great care should be taken of the understanding, to conduct it right in the search of knowledge, and in the judgments it makes.

The logic now in use has so long possessed the chair, as the only art taught in the schools for the direction of the mind in the study of the arts and sciences, that it would perhaps be thought an affectation of novelty to suspect, that rules that have served the learned world these two or three thousand years, and which without any complaint of defect the learned have rested in, are not sufficient to guide the understanding. And I should not doubt but this attempt would be censured as vanity or presumption, did not the great lord Verulam's authority justify it: who, not servilely thinking learning could not be advanced beyond what it was, because for many ages it had not been, did not rest in the lazy approbation and applause of what was, because it was; but enlarged his mind to what might be. In his preface to his *Novum Organum*, concerning logic he pronounces thus: "Qui summas dialecticæ partes tribuerunt, atque inde fidissima scientiis præsidia comparari putarunt, verissime et optime viderunt intellectum humanum sibi permissum merito suspectum esse debere. Verum infirmior omnino est malo medicina; nec ipsa mali expers. Siquidem dialectica, quæ

recepta est licet ad civilia et artes, quæ in sermone et opinione positæ sunt, rectissime adhibeatur ; naturæ tamen subtilitatem longo intervallo non attingit, et prænsando, quod non capit, ad errores potius stabilien- dos et quasi figendos quam ad viam veritati aperiendam valuit."

They, says he, who attributed so much to logic, perceived very well and truly, that it was not safe to trust the understanding to itself, without the guard of any rules. But the remedy reached not the evil, but became a part of it: for the logic which took place, though it might do well enough in civil affairs, and the arts which consisted in talk and opinion, yet comes very far short of subtilty in the real performances of nature ; and catching at what it cannot reach, has served to confirm and establish errors, rather than to open a way to truth. And therefore a little after he says, that it is absolutely necessary that a better and perfecter use and employment of the mind and understanding should be introduced: "Necessario requiritur ut melior et perfectior mentis et intellectus humani usus et adoperatio introducatur."

§ 2. *Parts*.—There is, it is visible, great variety in men's understandings, and their natural constitutions put so wide a difference between some men in this respect, that art and industry would never be able to master ; and their very natures seem to want a foundation to raise on it that which other men easily attain unto. Amongst men of equal education there is a great inequality of parts. And the woods of America, as well as the schools of Athens, produce men of several abilities in the same kind. Though this be so, yet I imagine most men come very short of what they might attain unto in their several degrees, by a neglect of their understandings. A few rules of logic are thought sufficient in this case for those who pretend to the highest improvement ; whereas I think there are a great many natural defects in the understanding capable of amendment, which are overlooked and wholly neglected. And it is easy to perceive that men are guilty of a great many faults in the exercise and improvement of this faculty of the mind, which hinder them in their progress, and keep them in ignorance and error all their lives. Some of them I shall take notice of, and endeavour to point out proper remedies for, in the following discourse.

§ 3. *Reasoning*.—Besides the want of determined ideas, and of sagacity and exercise in finding out and laying in order intermediate ideas, there are three miscarriages that men are guilty of in reference to their reason, whereby this faculty is hindered in them from that service it might do and was designed for. And he that reflects upon the actions and discourses of mankind, will find their defects in this kind very frequent, and very observable.

1. The first is of those who seldom reason at all, but do and think according to the example of others, whether parents, neighbours, ministers, or who else they are pleased to make choice of to have an implicit faith in, for the saving of themselves the pains and trouble of thinking and examining for themselves.

2. The second is of those who put passion in the place of reason, and being resolved that shall govern their actions and arguments, neither use their own, nor hearken to other people's reason, any farther than it suits their humour, interest, or party ; and these one may observe com-

monly content themselves with words which have no distinct ideas to them, though, in other matters that they come with an unbiassed indifference to, they want not abilities to talk and hear reason, where they have no secret inclination that hinders them from being untractable to it.

3. The third sort is of those who readily and sincerely follow reason, but for want of having that which one may call large, sound, round-about sense, have not a full view of all that relates to the question, and may be of moment to decide it. We are all short-sighted, and very often see but one side of the matter: our views are not extended to all that has a connexion with it. From this defect I think no man is free. We see but in part, and we know but in part, and therefore it is no wonder we conclude not right from our partial views. This might instruct the proudest esteemer of his own parts how useful it is to talk and consult with others, even such as come short of him in capacity, quickness, and penetration; for since no one sees all, and we generally have different prospects of the same thing, according to our different, as I may say, positions to it, it is not incongruous to think, nor beneath any man to try, whether another may not have notions of things which have escaped him, and which his reason would make use of if they came into his mind. The faculty of reasoning seldom or never deceives those who trust to it; its consequences from what it builds on are evident and certain, but that which it oftenest, if not only, misleads us in, is, that the principles from which we conclude, the grounds upon which we bottom our reasoning, are but a part, something is left out which should go into the reckoning to make it just and exact. Here we may imagine a vast and almost infinite advantage that angels and separate spirits may have over us; who, in their several degrees of elevation above us, may be endowed with more comprehensive faculties: and some of them perhaps have perfect and exact views of all finite beings that come under their consideration; can, as it were, in the twinkling of an eye, collect together all their scattered and almost boundless relations. A mind so furnished, what reason has it to acquiesce in the certainty of its conclusions!

In this we may see the reason why some men of study and thought, that reason right, and are lovers of truth, do make no great advances in their discoveries of it. Error and truth are uncertainly blended in their minds; their decisions are lame and defective, and they are very often mistaken in their judgments: The reason whereof is, they converse but with one sort of men, they read but one sort of books, they will not come in the hearing but of one sort of notions; the truth is, they canton out to themselves a little Goshen in the intellectual world, where light shines, and, as they conclude, day blesses them; but the rest of that vast expansum they give up to night and darkness, and so avoid coming near it. They have a petty traffic with known correspondents in some little creek: within that they confine themselves, and are dexterous managers enough of the wares and products of that corner with which they content themselves; but will not venture out into the great ocean of knowledge, to survey the riches that nature hath stored other parts with, no less genuine, no less solid, no less useful, than what has fallen to their lot in the admired plenty and sufficiency of their own

little spot, which to them contains whatsoever is good in the universe. Those who live thus mew'd up within their own contracted territories, and will not look abroad beyond the boundaries that chance, conceit, or laziness, has set to their inquiries, but live separate from the notions, discourses, and attainments, of the rest of mankind, may not amiss be represented by the inhabitants of the Marian islands; which being separate by a large tract of sea from all communion with the habitable parts of the earth, thought themselves the only people of the world. And though the straitness and conveniences of life amongst them had never reached so far as to the use of fire, till the Spaniards, not many years since, in their voyages from Acapulco to Manilla brought it amongst them; yet in the want and ignorance of almost all things, they looked upon themselves, even after that the Spaniards had brought amongst them the notice of variety of nations abounding in sciences, arts, and conveniences of life, of which they knew nothing, they looked upon themselves, I say, as the happiest and wisest people in the universe. But for all that, nobody, I think, will imagine them deep naturalists, or solid metaphysicians; nobody will deem the quickest-sighted amongst them to have very enlarged views in ethics or politics; nor can any one allow the most capable amongst them to be advanced so far in his understanding, as to have any other knowledge but of the few little things of his and the neighbouring islands within his commerce; but far enough from that comprehensive enlargement of mind, which adorns a soul devoted to truth, assisted with letters, and a free consideration of the several views and sentiments of thinking men of all sides. Let not men therefore that would have a sight of what every one pretends to, desirous to have a sight of truth in its full extent, be yet narrow and blind in their own prospect. Let not men think there is no truth but in the sciences that they study, or the books that they read. To prejudge other men's notions before we have looked into them, is not to shew their darkness, but to put out our own eyes. *Try all things, hold fast that which is good*, is a Divine rule, coming from the Father of light and truth: and it is hard to know what other way men can come at truth, to lay hold of it, if they do not dig and search for it as for gold and hid treasure; but he that does so must have much earth and rubbish before he gets the pure metal: sand, and pebbles, and dross, usually lie blended with it, but the gold is nevertheless gold, and will enrich the man that employs his pains to seek and separate it. Neither is there any danger he should be deceived by the mixture. Every man carries about him a touchstone, if he will make use of it, to distinguish substantial gold from superficial glittering, truth from appearances. And indeed the use and benefit of this touchstone, which is natural reason, is spoiled and lost only by assumed prejudices, overweening presumption, and narrowing our minds. The want of exercising it in the full extent of things intelligible, is that which weakens and extinguishes this noble faculty in us. Trace it, and see whether it be not so. The day-labourer in a country village has commonly but a small pittance of knowledge, because his ideas and notions have been confined to the narrow bounds of a poor conversation and employment. The low mechanic of a country town does somewhat outdo him; porters and

cobblers of great cities surpass them. A country gentleman, who, leaving Latin and learning in the university, removes thence to his mansion-house, and associates with neighbours of the same strain, who relish nothing but hunting and a bottle : with those alone he spends his time, with those alone he converses, and can away with no company whose discourse goes beyond what claret and dissoluteness inspire. Such a patriot, formed in this happy way of improvement, cannot fail, as we see, to give notable decisions upon the bench of quarter-sessions, and eminent proofs of his skill in politics, when the strength of his purse and party have advanced him to a more conspicuous station. To such a one truly an ordinary coffee-house gleaner of the city is an arrant statesman, and as much superior to, as a man conversant about White-hall and the court, is to an ordinary shop-keeper. To carry this a little farther. Here is one muffled up in the zeal and infallibility of his own sect, and will not touch a book, or enter into debate with a person, that will question any of those things which to him are sacred. Another surveys our differences in religion with an equitable and fair indifference, and so finds probably that none of them are in every thing unexceptionable. These divisions and systems were made by men, and carry the mark of fallible on them ; and in those whom he differs from, and till he opened his eyes had a general prejudice against, he meets with more to be said for a great many things than before he was aware of, or could have imagined. Which of these two now is most likely to judge right in our religious controversies, and to be most stored with truth, the mark all pretend to aim at? All these men that I have instanced in, thus unequally furnished with truth, and advanced in knowledge, I suppose of equal natural parts ; all the odds between them has been the different scope that has been given to their understandings to range in, for the gathering up of information, and furnishing their heads with ideas, notions, and observations, whereon to employ their minds, and form their understandings.

It will possibly be objected, Who is sufficient for all this? I answer, more than can be imagined. Every one knows what his proper business is, and what, according to the character he makes of himself, the world may justly expect of him ; and to answer that, he will find he will have time and opportunity enough to furnish himself, if he will not deprive himself, by a narrowness of spirit, of those helps that are at hand. I do not say, to be a good geographer that a man should visit every mountain, river, promontory, and creek, upon the face of the earth, view the buildings, and survey the land every where, as if he were going to make a purchase. But yet every one must allow that he shall know the country better that makes often sallies into it, and traverses it up and down, than he that like a mill-horse goes still round in the same tract, or keeps within the narrow bounds of a field or two that delight him. He that will inquire out the best books in every science, and inform himself of the most material authors of the several sects of philosophy and religion, will not find it an infinite work to acquaint himself with the sentiments of mankind concerning the most weighty and comprehensive subjects. Let him exercise the freedom of his reason and understanding in such a latitude as this, and his mind will be

strengthened, his capacity enlarged, his faculties improved : and the light which the remote and scattered parts of truth will give to one another, will so assist his judgment, that he will seldom be widely out, or miss giving proof of a clear head, and a comprehensive knowledge. At least, this is the only way I know to give the understanding its due improvement, to the full extent of its capacity, and to distinguish the two most different things I know in the world, a logical chicaner from a man of reason. Only he that would thus give the mind its flight, and send abroad his inquiries into all parts after truth, must be sure to settle in his head determined ideas of all that he employs his thoughts about, and never fail to judge himself, and judge unbiassedly, of all that he receives from others, either in their writings or discourses. Reverence or prejudice must not be suffered to give beauty or deformity to any of their opinions.

§ 4. *Of practice and habits.*—We are born with faculties and powers capable almost of any thing, such at least as would carry us farther than can be easily imagined : but it is only the exercise of those powers which gives us ability and skill in any thing, and leads us towards perfection.

A middle-aged ploughman will scarce ever be brought to the carriage and language of a gentleman, though his body be as well proportioned, and his joints as supple, and his natural parts not any way inferior. The legs of a dancing-master, and the fingers of a musician, fall as it were naturally without thought or pains into regular and admirable motions. Bid them change their parts, and they will in vain endeavour to produce like motions in the members not used to them, and it will require length of time and long practice to attain but some degrees of a like ability. What incredible and astonishing actions do we find rope-dancers and tumblers bring their bodies to ! not but that sundry in almost all manual arts are as wonderful ; but I name those which the world takes notice of for such, because, on that very account, they give money to see them. All these admired motions, beyond the reach and almost the conception of unpractised spectators, are nothing but the mere effects of use and industry in men whose bodies have nothing peculiar in them from those of the amazed lookers on.

As it is in the body, so it is in the mind ; practice makes it what it is : and most even of those excellences which are looked on as natural endowments, will be found, when examined into more narrowly, to be the product of exercise, and to be raised to that pitch only by repeated actions. Some men are remarked for pleasantness in raillery ; others for apologues and apposite diverting stories. This is apt to be taken for the effect of pure nature, and that the rather, because it is not got by rules ; and those who excel in either of them, never purposely set themselves to the study of it as an art to be learnt. But yet it is true, that at first some lucky hit which took with somebody, and gained him commendation, encouraged him to try again, inclined his thoughts and endeavours that way, till at last he insensibly got a facility in it without perceiving how ; and that is attributed wholly to nature, which was much more the effect of use and practice. I do not deny that natural disposition may often give the first rise to it ; but that never carries a man far without use and exercise, and it is practice alone that brings the powers of the mind as well as those of the body to their perfection.

Many a good poetic vein is buried under a trade, and never produces any thing for want of improvement. We see the ways of discourse and reasoning are very different, even concerning the same matter, at court and in the university. And he that will go but from Westminster-Hall to the Exchange, will find a different genius and turn in their ways of talking; and one cannot think that all whose lot fell in the city were born with different parts from those who were bred at the university or inns of court.

To what purpose all this, but to shew that the difference so observable in men's understandings and parts, does not arise so much from the natural faculties as acquired habits? He would be laughed at that should go about to make a fine dancer out of a country hedger, at past fifty. And he will not have much better success, who shall endeavour at that age to make a man reason well, or speak handsomely, who has never been used to it, though you should lay before him a collection of all the best precepts of logic or oratory. Nobody is made any thing by hearing of rules, or laying them up in his memory; practice must settle the habit of doing without reflecting on the rule: and you may as well hope to make a good painter or musician extempore by a lecture and instruction in the arts of music and painting, as a coherent thinker, or strict reasoner, by a set of rules, shewing him wherein right reasoning consists.

This being so, that defects and weakness in men's understandings, as well as other faculties, come from want of a right use of their own minds, I am apt to think the fault is generally mislaid upon nature, and there is often a complaint of want of parts when the fault lies in want of a due improvement of them. We see men frequently dexterous and sharp enough in making a bargain, who, if you reason with them about matters of religion, appear perfectly stupid.

§ 5. *Ideas*.—I will not here, in what relates to the right conduct and improvement of the understanding, repeat again the getting clear and determined ideas, and the employing our thoughts rather about them, than about sounds put for them; nor of settling the signification of words which we use with ourselves in the search of truth, or with others in discoursing about it. Those hinderances of our understandings in the pursuit of knowledge, I have sufficiently enlarged upon in another place; so that nothing more needs here to be said of those matters.

§ 6. *Principles*.—There is another fault that stops or misleads men in their knowledge, which I have also spoken something of, but yet is necessary to mention here again, that we may examine it to the bottom, and see the root it springs from, and that is a custom of taking up with principles that are not self-evident, and very often not so much as true. It is not unusual to see men rest their opinions upon foundations that have no more certainty nor solidity than the propositions built on them, and embraced for their sake. Such foundations are these and the like, viz. The founders or leaders of my party are good men, and therefore their tenets are true; it is the opinion of a sect that is erroneous, therefore it is false: it hath been long received in the world, therefore it is true; or, it is new, and therefore false.

These, and many the like, which are by no means the measures of truth and falsehood, the generality of men make the standards by which

they accustom their understanding to judge. And thus, they falling into a habit of determining of truth and falsehood by such wrong measures, it is no wonder they should embrace error for certainty, and be very positive in things they have no ground for.

There is not any one who pretends to the least reason, but when any of these his false maxims are brought to the test, must acknowledge them to be fallible, and such as he will not allow in those that differ from him; and yet, after he is convinced of this, you shall see him go on in the use of them, and the very next occasion that offers argue again upon the same grounds. Would one not be ready to think that men are willing to impose upon themselves, and mislead their own understanding, who conduct them by such wrong measures, even after they see they cannot be relied on? But yet they will not appear so blamable as may be thought at first sight: for I think there are a great many that argue thus in earnest, and do it not to impose on themselves or others. They are persuaded of what they say, and think there is weight in it, though in a like case they have been convinced there is none; but men would be intolerable to themselves, and contemptible to others, if they should embrace opinions without any ground, and hold what they could give no manner of reason for. True or false, solid or sandy, the mind must have some foundation to rest itself upon; and, as I have remarked in another place, it no sooner entertains any proposition, but it presently hastens to some hypothesis to bottom it on; till then it is unquiet and unsettled. So much do our own very tempers dispose us to a right use of our understandings, if we would follow as we should the inclinations of our nature.

In some matters of concernment, especially those of religion, men are not permitted to be always wavering and uncertain, they must embrace and profess some tenets or other; and it would be a shame, nay, a contradiction too heavy for any one's mind to lie constantly under, for him to pretend seriously to be persuaded of the truth of any religion, and yet not to be able to give any reason of his belief, or to say any thing for his preference of this to any other opinion; and therefore they must make use of some principles or other, and those can be no other than such as they have and can manage; and to say they are not in earnest persuaded by them, and do not rest upon those they make use of, is contrary to experience, and to allege that they are not misled when we complain they are.

If this be so, it will be urged, Why then do they not rather make use of sure and unquestionable principles, rather than rest on such grounds as may deceive them, and will, as is visible, serve to support error as well as truth?

To this I answer, the reason why they do not make use of better and surer principles, is because they cannot: but this inability proceeds not from want of natural parts (for those few whose case that is are to be excused), but for want of use and exercise. Few men are from their youth accustomed to strict reasoning, and to trace the dependence of any truth in a long train of consequences to its remote principles, and to observe its connexion; and he that by frequent practice has not been used to this employment of his understanding, it is no more wonder that

he should not, when he is grown into years, be able to bring his mind to it, than that he should not be on a sudden able to grave or design, dance on the ropes, or write a good hand, who has never practised either of them.

Nay, the most of men are so wholly strangers to this, that they do not so much as perceive their want of it; they dispatch the ordinary business of their callings by rote, as we say, as they have learnt it; and if at any time they miss success, they impute it to any thing rather than want of thought or skill; that they conclude (because they know no better), they have in perfection: or if there be any subject that interest or fancy has recommended to their thoughts, their reasoning about it is still after their own fashion, be it better or worse; it serves their turns, and is the best they are acquainted with; and therefore when they are led by it into mistakes, and their business succeeds accordingly, they impute it to any cross accident, or default of others, rather than to their own want of understanding; that it is what nobody discovers or complains of in himself. Whatsoever made his business to miscarry, it was not want of right thought or judgment in himself: he sees no such defect in himself, but is satisfied that he carries on his designs well enough by his own reasoning; or at least should have done, had it not been for unlucky traverses not in his power. Thus being content with this short and very imperfect use of his understanding, he never troubles himself to seek out methods of improving his mind, and lives all his life without any notion of close reasoning, in a continued connexion of a long train of consequences from sure foundations, such as is requisite for the making out and clearing most of the speculative truths most men own to believe and are most concerned in. Not to mention here what I shall have occasion to insist on by and by more fully, viz. that in many cases it is not one series of consequences will serve the turn, but many different and opposite deductions must be examined and laid together, before a man can come to make a right judgment of the thing in question. What then can be expected from men that neither see the want of any such kind of reasoning as this; nor, if they do, know they how to set about it, or could perform it? You may as well set a countryman, who scarce knows the figures, and never cast up a sum of three particulars, to state a merchant's long account, and find the true balance of it.

What then should be done in the case? I answer, we should always remember what I said above, that the faculties of our souls are improved and made useful to us, just after the same manner as our bodies are. Would you have a man write or paint, dance or fence well, or perform any other manual operation dexterously and with ease, let him have never so much vigour and activity, suppleness and address, naturally, yet nobody expects this from him unless he has been used to it, and has employed time and pains in fashioning and forming his hand or outward parts to these motions. Just so it is in the mind; would you have a man reason well, you must use him to it betimes, exercise his mind in observing the connexion of ideas, and following them in train. Nothing does this better than mathematics, which therefore I think should be taught all those who have the time and opportunity; not so much to

make them mathematicians, as to make them reasonable creatures ; for though we all call ourselves so, because we are born to it if we please, yet we may truly say nature gives us but the seeds of it ; we are born to be, if we please, rational creatures, but it is use and exercise only that makes us so, and we are indeed so no farther than industry and application has carried us. And therefore in ways of reasoning which men have not been used to, he that will observe the conclusion they take up, must be satisfied they are not at all rational.

This has been the less taken notice of, because every one in his private affairs uses some sort of reasoning or other, enough to denominate him reasonable. But the mistake is, that he that is found reasonable in one thing is concluded to be so in all ; and to think or say otherwise, is thought so unjust an affront, and so senseless to censure, that nobody ventures to do it. It looks like the degradation of a man below the dignity of his nature. It is true, that he that reasons well in any one thing, has a mind naturally capable of reasoning well in others, and to the same degree of strength and clearness, and possibly much greater, had his understanding been so employed. But it is as true, that he who can reason well to-day about one sort of matters, cannot at all reason to-day about others, though perhaps a year hence he may. But wherever a man's rational faculty fails him, and will not serve him to reason, there we cannot say he is rational, how capable soever he may be by time and exercise to become so.

Try in men of low and mean education, who have never elevated their thoughts above the spade and the plough, nor looked beyond the ordinary drudgery of a day-labourer. Take the thoughts of such a one, used for many years to one tract, out of that narrow compass he has been all his life confined to, you will find him no more capable of reasoning than almost a perfect natural. Some one or two rules, on which their conclusions immediately depend, you will find in most men have governed all their thoughts ; these, true or false, have been the maxims they have been guided by : take these from them, and they are perfectly at a loss ; their compass and pole-star then are gone, and their understanding is perfectly at a nonplus : and therefore they either immediately return to their old maxims again, as the foundations of all truth to them, notwithstanding all that can be said to shew their weakness ; or if they give them up to their reasons, they with them give up all truth and farther inquiry, and think there is no such thing as certainty. For if you would enlarge their thoughts, and settle them upon more remote and surer principles, they either cannot easily apprehend them, or if they can, know not what use to make of them ; for long deductions from remote principles is what they have not been used to, and cannot manage.

What then ! can grown men never be improved or enlarged in their understandings ? I say not so ; but this I think I may say, that it will not be done without industry and application, which will require more time and pains than grown men, settled in their course of life, will allow to it, and therefore very seldom is done. And this very capacity of attaining it by use and exercise only, brings us back to that which I laid down before, that it is only practice that improves our minds as well as

bodies, and we must expect nothing from our understandings any farther than they are perfected by habits.

The Americans are not all born with worse understandings than the Europeans, though we see none of them have such reaches in the arts and sciences. And among the children of a poor countryman, the lucky chance of education and getting into the world, gives one infinitely the superiority in parts over the rest, who, continuing at home, had continued also just of the same size with his brethren.

He that has to do with young scholars, especially in mathematics, may perceive how their minds open by degrees, and how it is exercise alone that opens them. Sometimes they will stick a long time at a part of demonstration, not for want of will or application, but really for want of perceiving the connexion of two ideas, that, to one whose understanding is more exercised, is as visible as any thing can be. The same would be with a grown man beginning to study mathematics; the understanding, for want of use, often sticks in a very plain way; and he himself that is so puzzled, when he comes to see the connexion, wonders what it was he stuck at in a case so plain.

§ 7. *Mathematics.*—I have mentioned mathematics as a way to settle in the mind a habit of reasoning closely and in train; not that I think it necessary that all men should be deep mathematicians, but that, having got the way of reasoning which that study necessarily brings the mind to, they might be able to transfer it to other parts of knowledge, as they shall have occasion. For in all sorts of reasoning, every single argument should be managed as a mathematical demonstration, the connexion and dependence of ideas should be followed till the mind is brought to the source on which it bottoms, and observes the coherence all along; though in proofs of probability, one such train is not enough to settle the judgment as in demonstrative knowledge.

Where a truth is made out by one demonstration, there needs no farther inquiry; but in all probabilities, where there wants demonstration to establish the truth beyond doubt, there it is not enough to trace one argument to its source, and observe its strength and weakness, but all the arguments, after having been so examined on both sides, must be laid in balance one against another, and upon the whole the understanding determines its assent.

This is a way of reasoning the understanding should be accustomed to, which is so different from what the illiterate are used to, that even learned men oftentimes seem to have little or no notion of it. Nor is it to be wondered, since the way of disputing in the schools leads them quite away from it, by insisting on one topical argument, by the success of which the truth or falsehood of the question is to be determined, and victory adjudged to the opponent or defendant; which is all one as if he should balance an account by one sum charged and discharged, when there are a hundred others to be taken into consideration.

This, therefore, it would be well if men's minds were accustomed to, and that early, that they might not erect their opinions upon one single view, when so many other are requisite to make up the account, and must come into the reckoning before a man can form a right judgment. This would enlarge their minds, and give a due freedom to their under-

standings, that they might not be led into error by presumption, laziness, or precipitancy; for I think nobody can approve such a conduct of the understanding, as should mislead it from truth, though it be never so much in fashion to make use of it.

To this perhaps it will be objected, that to manage the understanding as I propose would require every man to be a scholar, and to be furnished with all the materials of knowledge, and exercised in all the ways of reasoning. To which I answer, that it is a shame for those that have time and the means to attain knowledge, to want any helps or assistance for the improvement of their understandings that are to be got, and to such I would be thought here chiefly to speak. Those, methinks, who by the industry and parts of their ancestors have been set free from a constant drudgery to their backs and their bellies, should bestow some of their spare time on their heads, and open their minds by some trials and essays in all the sorts and matters of reasoning. I have before mentioned mathematics, wherein algebra gives new helps and views to the understanding. If I propose these, it is not, as I said, to make every man a thorough mathematician, or a deep algebraist; but yet I think the study of them is of infinite use even to grown men; first, by experimentally convincing them, that to make any one reason well, it is not enough to have parts wherewith he is satisfied, and that serve him well enough in his ordinary course. A man in those studies will see, that however good he may think his understanding, yet in many things, and those very visible, it may fail him. This would take off that presumption that most men have of themselves in this part; and they would not be so apt to think their minds wanted no helps to enlarge them, that there could be nothing added to the acuteness and penetration of their understandings.

Secondly, the study of mathematics would shew them the necessity there is, in reasoning, to separate all the distinct ideas, and see the habitudes that all those concerned in the present inquiry have to one another, and to lay by those which relate not to the proposition in hand, and wholly to leave them out of the reckoning. This is that which, in other subjects besides quantity, is what is absolutely requisite to just reasoning, though in them it is not so easily observed, nor so carefully practised. In those parts of knowledge where it is thought demonstration has nothing to do, men reason as it were in the lump; and if upon a summary and confused view, or upon a partial consideration, they can raise the appearance of a probability, they usually rest content; especially if it be in a dispute where every little straw is laid hold on, and every thing that can but be drawn in any way to give colour to the argument, is advanced with ostentation. But that mind is not in a posture to find the truth, that does not distinctly take all the parts asunder, and, omitting what is not at all to the point, draw a conclusion from the result of all the particulars which any way influence it. There is another no less useful habit to be got by an application to mathematical demonstrations, and that is, of using the mind to a long train of consequences; but having mentioned that already, I shall not again here repeat it.

As to men whose fortunes and time is narrower, what may suffice

them is not of that vast extent as may be imagined, and so comes not within the objection.

Nobody is under an obligation to know every thing. Knowledge and science in general, is the business only of those who are at ease and leisure. Those who have particular callings ought to understand them: and it is no unreasonable proposal, nor impossible to be compassed, that they should think and reason right about what is their daily employment. This one cannot think them incapable of, without levelling them with the brutes, and charging them with a stupidity below the rank of rational creatures.

§ 8. *Religion*.—Besides his particular calling for the support of this life, every one has a concern in a future life, which he is bound to look after. This engages his thoughts in religion; and here it mightily lies upon him to understand and reason right. Men therefore cannot be excused from understanding the words, and framing the general notions, relating to religion right. The one day of seven, besides other days of rest, allows in the Christian world time enough for this (had they no other idle hours), if they would but make use of these vacancies from their daily labour, and apply themselves to an improvement of knowledge, with as much diligence as they often do to a great many other things that are useless; and had but those that would enter them according to their several capacities in a right way to this knowledge. The original make of their minds is like that of other men, and they would be found not to want understanding fit to receive the knowledge of religion, if they were a little encouraged and helped in it as they should be. For there are instances of very mean people, who have raised their minds to a great sense and understanding of religion. And though these have not been so frequent as could be wished, yet they are enough to clear that condition of life from a necessity of gross ignorance, and to shew that more might be brought to be rational creatures and Christians (for they can hardly be thought really to be so, who, wearing the name, know not so much as the very principles of that religion), if due care were taken of them. For, if I mistake not, the peasantry lately in France (a rank of people under a much heavier pressure of want and poverty than the day-labourers in England), of the reformed religion, understood it much better, and could say more for it, than those of a higher condition among us.

But if it shall be concluded that the meaner sort of people must give themselves up to a brutish stupidity in the things of their nearest concernment, which I see no reason for, this excuses not those of a freer fortune and education, if they neglect their understandings, and take no care to employ them as they ought, and set them right in the knowledge of those things for which principally they were given them. At least, those whose plentiful fortunes allow them the opportunities and helps of improvements, are not so few, but that it might be hoped great advancements might be made in knowledge of all kinds, especially in that of the greatest concern and largest views, if men would make a right use of their faculties, and study their own understandings.

§ 9. *Ideas*.—Outward corporeal objects, that constantly importune our senses and captivate our appetites, fail not to fill our heads with

lively and lasting ideas of that kind. Here the mind needs not be set upon getting greater store; they offer themselves fast enough, and are usually entertained in such plenty, and lodged so carefully, that the mind wants room or attention for others that it has more use and need of. To fit the understanding, therefore, for such reasoning as I have been above speaking of, care should be taken to fill it with moral and more abstract ideas; for these not offering themselves to the senses, but being to be framed to the understanding, people are generally so neglectful of a faculty they are apt to think wants nothing, that I fear most men's minds are more unfurnished with such ideas than is imagined. They often use the words, and how can they be suspected to want the ideas? What I have said in the third book of my *Essay* will excuse me from any other answer to this question. But to convince people of what moment it is to their understandings to be furnished with such abstract ideas steady and settled in it, give me leave to ask how any one shall be able to know, whether he be obliged to be just, if he has not established ideas in his mind of obligation and of justice, since knowledge consists in nothing but the perceived agreement or disagreement of those ideas; and so of all others the like, which concern our lives and manners. And if men do find a difficulty to see the agreement or disagreement of two angles which lie before their eyes, unalterably in a diagram, how utterly impossible will it be to perceive it in ideas, that have no other sensible objects to represent them to the mind but sounds, with which they have no manner of conformity, and therefore had need to be clearly settled in the mind themselves, if we would make any clear judgment about them! This, therefore, is one of the first things the mind should be employed about in the right conduct of the understanding, without which it is impossible it should be capable of reasoning right about those matters. But in these, and all other ideas, care must be taken that they harbour no inconsistencies, and that they have a real existence where real existence is supposed, and are not mere chimeras with a supposed existence.

§ 10. *Prejudices*.—Every one is forward to complain of the prejudices that mislead other men or parties, as if he were free, and had none of his own. This being objected on all sides, it is agreed that it is a fault, and a hinderance to knowledge. What now is the cure? No other but this, that every man should let alone other's prejudices, and examine his own. Nobody is convinced of his by the accusation of another: he recriminates by the same rule and is clear. The only way to remove this great cause of ignorance and error out of the world is, for every one impartially to examine himself. If others will not deal fairly with their own minds, does that make my errors truth, or ought it to make me in love with them, and willing to impose on myself? If others love cataracts on their eyes, should that hinder me from couching of mine as soon as I could? Every one declares against blindness, and yet who almost is not fond of that which dims his sight, and keeps the clear light out of his mind, which should lead him into truth and knowledge? False or doubtful positions, relied upon as unquestionable maxims, keep those in the dark from truth, who build on them. Such are usually the prejudices imbibed from education, party, reverence,

fashion, interest, &c. This is the mote which every one sees in his brother's eye, but never regards the beam in his own. For who is there almost that is ever brought fairly to examine his own principles, and see whether they are such as will bear the trial? but yet this should be one of the first things every one should set about, and be scrupulous in, who would rightly conduct his understanding in the search of truth and knowledge.

To those who are willing to get rid of this great hinderance of knowledge (for to such only I write); to those who would shake off this great and dangerous impostor Prejudice, who dresses up falsehood in the likeness of truth, and so dexterously hoodwinks men's minds, as to keep them in the dark, with a belief that they are more in the light than any that do not see with their eyes; I shall offer this one mark whereby prejudice may be known. He that is strongly of any opinion, must suppose (unless he be self-condemned) that his persuasion is built upon good grounds; and that his assent is no greater than what the evidence of the truth he holds forces him to; and that they are arguments, and not inclination or fancy, that make him so confident and positive in his tenets. Now if, after all his profession, he cannot bear any opposition to his opinion; if he cannot so much as give a patient hearing, much less examine and weigh the arguments on the other side, does he not plainly confess it is prejudice governs him? And it is not evidence of truth, but some lazy anticipation, some beloved presumption, that he desires to rest undisturbed in. For if what he holds be as he gives out, well fenced with evidence, and he sees it to be true, what need he fear to put it to the proof? If his opinion be settled upon a firm foundation, if the arguments that support it, and have obtained his assent, be clear, good, and convincing, why should he be shy to have it tried whether they be proof or not? He whose assent goes beyond his evidence, owes this excess of his adherence only to prejudice, and does in effect own it when he refuses to hear what is offered against it; declaring thereby, that it is not evidence he seeks, but the quiet enjoyment of the opinion he is fond of, with a forward condemnation of all that may stand in opposition to it, unheard, and unexamined; which, what is it but prejudice? *Qui æquum statuerit parte inauditâ alterâ, etiam si æquum statuerit haud æquus fuerit.* He that would acquit himself in this case as a lover of truth, not giving way to any pre-occupation or bias that may mislead him, must do two things that are not very common, nor very easy.

§ 11. *Indifferency.*—First, he must not be in love with any opinion, or wish it to be true, until he knows it to be so, and then he will not need to wish it: for nothing that is false can deserve our good wishes, nor a desire that it should have the place and force of truth; and yet nothing is more frequent than this. Men are fond of certain tenets upon no other evidence but respect and custom, and think they must maintain them, or all is gone; though they have never examined the ground they stand on, nor have ever made them out to themselves, or can make them out to others. We should contend earnestly for the truth, but we should first be sure that it is truth, or else we fight against God, who is the God of truth, and do the work of the devil, who is the father and pro-

pagator of lies ; and our zeal, though never so warm, will not excuse us ; for this is plainly prejudice.

§ 12. *Examine.*—Secondly, he must do that which he will find himself very averse to, as judging the thing unnecessary, or himself incapable of doing of it. He must try whether his principles be certainly true or not, and how far he may safely rely upon them. This, whether fewer have the heart or the skill to do, I shall not determine ; but this I am sure, this is that which every one ought to do who professes to love truth, and would not impose upon himself ; which is a surer way to be made a fool of than by being exposed to the sophistry of others. The disposition to put any cheat upon ourselves, works constantly, and we are pleased with it, but are impatient of being bantered or misled by others. The inability I here speak of, is not any natural defect that makes men incapable of examining their own principles. To such, rules of conducting their understandings are useless, and that is the case of very few. The great number is of those whom the ill habit of never exerting their thoughts has disabled : the powers of their minds are starved by disuse, and have lost that reach and strength which nature fitted them to receive from exercise. Those who are in a condition to learn the first rules of plain arithmetic, and could be brought to cast up an ordinary sum, are capable of this, if they had but accustomed their minds to reasoning : but they that have wholly neglected the exercise of their understandings in this way, will be very far at first from being able to do it, and as unfit for it as one unpractised in figures to cast up a shop-book, and perhaps think it as strange to be set about it. And yet it must nevertheless be confessed to be a wrong use of our understandings, to build our tenets (in things where we are concerned to hold the truth) upon principles that may lead us into error. We take our principles at hap-hazard upon trust, and without ever having examined them, and then believe a whole system, upon a presumption that they are true and solid ; and what is all this but childish, shameful, senseless credulity ?

In these two things, viz. an equal indifferency for all truth ; I mean the receiving it in the love of it as truth, but not loving it for any other reason before we know it to be true ; and in the examination of our principles, and not receiving any for such, nor building on them, until we are fully convinced, as rational creatures, of their solidity, truth, and certainty, consists that freedom of the understanding which is necessary to a rational creature, and without which it is not truly an understanding. It is conceit, fancy, extravagance, any thing rather than understanding, if it must be under the constraint of receiving and holding opinions by the authority of any thing but their own, not fancied, but perceived, evidence. This was rightly called imposition, and is of all other the worst and most dangerous sort of it. For we impose upon ourselves, which is the strongest imposition of all others ; and we impose upon ourselves in that part which ought with the greatest care to be kept free from all imposition. The world is apt to cast great blame on those who have an indifferency for opinions, especially in religion. I fear this is the foundation of great error and worse consequences. To be indifferent which of two opinions is true, is the right temper of

the mind that preserves it from being imposed upon, and disposes it to examine with that indifferency, until it has done its best to find the truth, and this is the only direct and safe way to it. But to be indifferent whether we embrace falsehood for truth, or no, is the great road to error. Those who are not indifferent which opinion is true, are guilty of this; they suppose, without examining, that what they hold is true, and then think they ought to be zealous for it. Those, it is plain by their warmth and eagerness, are not indifferent for their own opinions, but methinks are very indifferent whether they be true or false, since they cannot endure to have any doubts raised, or objections made, against them; and it is visible they never have made any themselves, and so, never having examined them, know not, nor are concerned, as they should be, to know whether they be true or false.

These are the common and most general miscarriages which I think men should avoid or rectify in a right conduct of their understandings, and should be particularly taken care of in education. The business whereof, in respect of knowledge, is not, as I think, to perfect a learner in all or any one of the sciences, but to give his mind that freedom, that disposition, and those habits, that may enable him to attain any part of knowledge he shall apply himself to, or stand in need of, in the future course of his life.

This, and this only, is well principling; and not the instilling a reverence and veneration for certain dogmas under the specious title of principles, which are often so remote from that truth and evidence which belongs to principles, that they ought to be rejected as false and erroneous: and is often the cause, to men so educated, when they come abroad into the world, and find they cannot maintain the principles so taken up and rested in, to cast off all principles, and turn perfect sceptics, regardless of knowledge and virtue.

There are several weaknesses and defects in the understanding, either from the natural temper of the mind, or ill habits taken up, which hinder it in its progress to knowledge. Of these there are as many, possibly, to be found, if the mind were properly studied, as there are diseases of the body, each whereof clogs and disables the understanding to some degree, and therefore deserves to be looked after and cured. I shall set down some few to excite men, especially those who make knowledge their business, to look into themselves, and observe whether they do not indulge some weakness, allow some miscarriages, in the management of their intellectual faculty, which is prejudicial to them in the search of truth.

§ 13. *Observations.*—Particular matters of fact are the undoubted foundations on which our civil and natural knowledge is built: the benefit the understanding makes of them is, to draw from them conclusions, which may be as standing rules of knowledge, and consequently of practice. The mind often makes not that benefit it should of the information it receives from the accounts of civil or natural historians, in being too forward, or too slow, in making observations on the particular facts recorded in them.

There are those who are very assiduous in reading, and yet do not much advance their knowledge by it. They are delighted with the

stories that are told, and perhaps can tell them again, for they make all they read nothing but history to themselves; but not reflecting on it, not making to themselves observations from what they read, they are very little improved by all that crowd of particulars that either pass through, or lodge themselves in, their understandings. They dream on in a constant course of reading and cramming themselves, but, not digesting any thing, it produces nothing but a heap of crudities.

If their memories retain well, one may say they have the materials of knowledge; but, like those for building, they are of no advantage, if there be no other use made of them but to let them lie heaped up together. Opposite to these, there are others who lose the improvement they should make of matters of fact by a quite contrary conduct. They are apt to draw general conclusions, and raise axioms from every particular they meet with. These make as little true benefit of history as the other, nay, being of forward and active spirits, receive more harm by it; it being of worse consequence to steer one's thoughts by a wrong rule, than to have none at all; error doing to busy men much more harm, than ignorance to the slow and sluggish. Between these, those seem to do best who, taking material and useful hints, sometimes from single matters of fact, carry them in their minds to be judged of, by what they shall find in history to confirm or reverse these imperfect observations; which may be established into rules fit to be relied on, when they are justified by a sufficient and wary induction of particulars. He that makes no such reflections on what he reads, only loads his mind with a rhapsody of tales, fit in winter nights for the entertainment of others; and he that will improve every matter of fact into a maxim, will abound in contrary observations, that can be of no other use but to perplex and pudder him if he compares them; or else to misguide him, if he gives himself up to the authority of that, which for its novelty, or some other fancy, best pleases him.

§ 14. *Bias*.—Next to these we may place those who suffer their own natural tempers and passions they are possessed with to influence their judgments, especially of men and things, that may any way relate to their present circumstances and interest. Truth is all simple, all pure, will bear no mixture of any thing else with it. It is rigid and inflexible to any bye interests; and so should the understanding be, whose use and excellency lies in conforming itself to it. To think of every thing just as it is in itself, is the proper business of the understanding, though it be not that which men always employ it to. This all men at first hearing allow is the right use every one should make of his understanding. Nobody will be at such an open defiance with common sense, as to profess that we should not endeavour to know, and to think of, things as they are in themselves; and yet there is nothing more frequent than to do the contrary; and men are apt to excuse themselves, and think they have reason to do so, if they have but a pretence that it is for God, or a good cause, that is, in effect, for themselves, their own persuasion, or party: for those in their turns the several sects of men, especially in matters of religion, entitle God and a good cause. But God requires not men to wrong or misuse their faculties for him, nor to lie to others

or themselves for his sake ; which they purposely do who will not suffer their understandings to have right conceptions of the things proposed to them, and designedly restrain themselves from having just thoughts of every thing as far as they are concerned to inquire. And as for a good cause, that needs not such ill helps ; if it be good, truth will support it, and it has no need of fallacy or falsehood.

§ 15. *Arguments.*—Very much of kin to this is the hunting after arguments to make good one side of a question, and wholly to neglect or refuse those which favour the other side. What is this but wilfully to misguide the understanding? and is so far from giving truth its due value, that it wholly debases it: espouse opinions that best comport with their power, profit, or credit, and then seek arguments to support them? Truth lit upon this way, is of no more avail to us than error; for what is so taken up by us, may be false as well as true, and he has not done his duty who has thus stumbled upon truth in his way to preferment.

There is another, but more innocent, way of collecting arguments, very familiar among bookish men, which is, to furnish themselves with the arguments they meet with *pro* and *con* in the questions they study. This helps them not to judge right nor argue strongly, but only to talk copiously on either side, without being steady and settled in their own judgments: for such arguments gathered from other men's thoughts, floating only in the memory, are there ready indeed to supply copious talk with some appearance of reason, but are far from helping us to judge right. Such variety of arguments only distract the understanding that relies on them, unless it has gone farther than such a superficial way of examining; this is to quit truth for appearance, only to serve our vanity. The sure and only way to get true knowledge, is to form in our minds clear settled notions of things, with names annexed to those determined ideas. These we are to consider, and with their several relations and habitudes, and not amuse ourselves with floating names, and words of indetermined signification, which we can use in several senses to serve a turn. It is in the perception of the habitudes and respects our ideas have one to another, that real knowledge consists; and when a man once perceives how far they agree or disagree one with another, he will be able to judge of what other people say, and will not need to be led by the arguments of others, which are many of them nothing but plausible sophistry. This will teach him to state the question right, and see whereon it turns; and thus he will stand upon his own legs, and know by his own understanding. Whereas, by collecting and learning arguments by heart, he will be but a retainer to others; and when any one questions the foundations they are built upon, he will be at a nonplus, and be fain to give up his implicit knowledge.

§ 16. *Haste.*—Labour for labour's sake is against nature. The understanding, as well as all the other faculties, chooses always the shortest way to its end, would presently obtain the knowledge it is about, and then set upon some new inquiry. But this, whether laziness or haste, often misleads it; and makes it content itself with improper ways of search, and such as will not serve the turn. Sometimes it rests upon testimony, when testimony of right has nothing to do, because it is easier

to believe than to be scientifically instructed. Sometimes it contents itself with one argument, and rests satisfied with that, as it were a demonstration; whereas the thing under proof is not capable of demonstration, and therefore must be submitted to the trial of probabilities, and all the material arguments *pro* and *con* be examined and brought to a balance. In some cases the mind is determined by probable topics, and inquiries where demonstration may be had. All these, and several others, which laziness, impatience, custom, and want of use and attention, lead men into, are misapplications of the understanding in the search of truth. In every question, the nature and manner of the proof it is capable of should first be considered, to make our inquiry such as it should be. This would save a great deal of frequently misemployed pains, and lead us sooner to that discovery and possession of truth we are capable of. The multiplying variety of arguments, especially frivolous ones, such as are all that are merely verbal, is not only lost labour, but cumpers the memory to no purpose, and serves only to hinder it from seizing and holding of the truth in all those cases which are capable of demonstration. In such a way of proof the truth and certainty is seen, and the mind fully possesses itself of it; when in the other way of assent it only hovers about it, is amused with uncertainties. In this superficial way indeed, the mind is capable of more variety of plausible talk, but is not enlarged as it should be in its knowledge. It is to this same haste and impatience of the mind also, that a not due tracing of the arguments to their true foundation is owing; men see a little, presume a great deal, and so jump to the conclusion. This is a short way to fancy and conceit, and (if firmly embraced) to opinionatry, but is certainly the farthest way about to knowledge. For he that will know, must, by the connexion of the proofs, see the truth, and the ground it stands on: and therefore, if he has for haste skipt over what he should have examined, he must begin and go over all again, or else he will never come to knowledge.

§ 17. *Desultory*.—Another fault of as ill consequence as this, which proceeds also from laziness, with a mixture of vanity, is the skipping from one sort of knowledge to another. Some men's tempers are quickly weary of any one thing. Constancy and assiduity is what they cannot bear: the same study long continued in, is as intolerable to them as the appearing long in the same clothes or fashion is to a court lady.

§ 18. *Smattering*.—Others, that they may seem universally knowing, get a little smattering in every thing. Both these may fill their heads with superficial notions of things, but are very much out of the way of attaining truth or knowledge.

§ 19. *Universality*.—I do not here speak against the taking a taste of every sort of knowledge; it is certainly very useful and necessary to form the mind: but then it must be done in a different way, and to a different end. Not for talk and vanity to fill the head with shreds of all kinds, that he who is possessed of such a frippery, may be able to match all the discourse of all he shall meet with, as if nothing could come amiss to him; and his head was so well stored a magazine, that nothing could be proposed which he was not master of, and was readily

furnished to entertain any one on. This is an excellency indeed, and a great one too, to have a real and true knowledge in all or most of the objects of contemplation. But it is what the mind of one and the same man can hardly attain unto; and the instances are so few of those who have in any measure approached towards it, that I know not whether they are to be proposed as examples in the ordinary conduct of the understanding. For a man to understand fully the business of his particular calling in the commonwealth, and of religion, which is his calling as he is a man in the world, is usually enough to take up his whole time; and there are few that inform themselves in these, which is every man's proper and peculiar business, so to the bottom as they should do. But though this be so, and there are very few men that extend their thoughts towards universal knowledge; yet I do not doubt but if the right way were taken, and the methods of inquiry were ordered as they should be, men of little business and great leisure might go a great deal farther in it than is usually done. To return to the business in hand: The end and use of a little insight in those parts of knowledge, which are not a man's proper business, is, to accustom our minds to all sorts of ideas, and the proper ways of examining their habitudes and relations. This gives the mind a freedom; and the exercising the understanding in the several ways of inquiry and reasoning, which the most skilful have made use of, teaches the mind sagacity and wariness, and a suppleness to apply itself more closely and dexterously to the bents and turns of the matter in all its researches. Besides, this universal taste of all the sciences, with an indifferency before the mind is possessed with any one in particular, and grown into love and admiration of what is made its darling, will prevent another evil very commonly to be observed in those who have from the beginning been seasoned only by one part of knowledge. Let a man be given up to the contemplation of one sort of knowledge, and that will become every thing. The mind will take such a tincture from a familiarity with that object, that every thing else, how remote soever, will be brought under the same view. A metaphysician will bring ploughing and gardening immediately to abstract notions: the history of nature shall signify nothing to him. An alchymist, on the contrary, shall reduce divinity to the maxims of his laboratory, explain morality by *sal*, *sulphur*, and *mercury*, and allegorise the Scripture itself, and the sacred mysteries thereof, into the philosopher's stone. And I heard once a man, who had a more than ordinary excellency in music, seriously accommodate Moses's seven days of the first week to the notes of music, as if from thence had been taken the measure and method of the creation. It is of no small consequence to keep the mind from such a possession, which I think is best done by giving it a fair and equal view of the whole intellectual world, wherein it may see the order, rank, and beauty, of the whole, and give a just allowance to the distinct provinces of the several sciences in the due order and usefulness of each of them.

If this be that which old men will not think necessary, nor be easily brought to; it is fit at least that it should be practised in the breeding of the young. The business of education, as I have already observed, is not, as I think, to make them perfect in any one of the sciences, but

so to open and dispose their minds as may best make them capable or any, when they shall apply themselves to it. If men are for a long time accustomed only to one sort or method of thoughts, their minds grow stiff in it, and do not readily turn to another. It is therefore to give them this freedom, that I think they should be made to look into all sorts of knowledge, and exercise their understandings in so wide a variety and stock of knowledge. But I do not propose it as a variety and stock of knowledge, but a variety and freedom of thinking; as an increase of the powers and activity of the mind, not as an enlargement of its possessions.

§ 20. *Reading*.—This is that which I think great readers are apt to be mistaken in. Those who have read of every thing are thought to understand every thing too; but it is not always so. Reading furnishes the mind only with materials of knowledge: it is thinking makes what we read ours. We are of the ruminating kind, and it is not enough to cram ourselves with a great load of collections; unless we chew them over again, they will not give us strength and nourishment. There are indeed in some writers visible instances of deep thought, close and acute reasoning, and ideas well pursued. The light these would give, would be of great use, if their readers would observe and imitate them: all the rest at best are but particulars fit to be turned into knowledge; but that can be done only by our own meditation, and examining the reach, force, and coherence, of what is said; and then, as far as we apprehend and see the connexion of ideas, so far is it ours; without that it is but so much loose matter floating in our brain. The memory may be stored, but the judgment is little better, and the stock of knowledge not increased by being able to repeat what others have said, or produce the arguments we have found in them. Such a knowledge as this is but knowledge by hearsay, and the ostentation of it is at best but talking by rote, and very often upon weak and wrong principles. For all that is to be found in books, is not built upon true foundations, nor always rightly deduced from the principles it is pretended to be built on. Such an examen as is requisite to discover that, every reader's mind is not forward to make; especially in those who have given themselves up to a party, and only hunt for what they can scrape together, that may favour and support the tenets of it. Such men wilfully exclude themselves from truth, and from all true benefit to be received by reading. Others, of more indifference, often want attention and industry. The mind is backward in itself to be at the pains to trace every argument to its original, and to see upon what basis it stands, and how firmly; but yet it is this that gives so much the advantage to one man more than another in reading. The mind should, by severe rules, be tied down to this, at first uneasy, task; use and exercise will give it facility. So that those who are accustomed to it, readily, as it were with one cast of the eye, take a view of the argument, and presently, in most cases, see where it bottoms. Those who have got this faculty, one may say, have got the true key of books, and the clue to lead them through the mizmaze of variety of opinions and authors to truth and certainty. This young beginners should be entered in, and shewed the use of, that they might profit by their reading. Those who are strangers to it, will be apt to think it too

great a clog in the way of men's studies; and they will suspect they shall make but small progress, if, in the books they read, they must stand to examine and unravel every argument, and follow it step by step up to its original.

I answer, this is a good objection, and ought to weigh with those whose reading is designed for much talk and little knowledge, and I have nothing to say to it. But I am here inquiring into the conduct of the understanding in its progress towards knowledge; and to those who aim at that, I may say, that he who fair and softly goes steadily forward in a course that points right, will sooner be at his journey's end, than he that runs after every one he meets, though he gallop all day full speed.

To which let me add, that this way of thinking on, and profiting by what we read, will be a clog and rub to any one only in the beginning; when custom and exercise has made it familiar, it will be dispatched, in the most occasions, without resting or interruption in the course of our reading. The motions and views of a mind exercised that way, are wonderfully quick; and a man used to such sort of reflections, sees as much at one glimpse, as would require a long discourse to lay before another, and make out in an entire and gradual deduction. Besides, that when the first difficulties are over, the delight and sensible advantage it brings, mightily encourages and enlivens the mind in reading, which, without this, is very improperly called study.

§ 21. *Intermediate principles.*—As an help to this, I think it may be proposed, that for the saving the long progression of the thoughts to remote and first principles in every case, the mind should provide itself several stages; that is to say, intermediate principles, which it might have recourse to in the examining those positions that come in its way. These, though they are not self-evident principles, yet, if they have been made out from them by a wary and unquestionable deduction, may be depended on as certain and infallible truths, and serve as unquestionable truths to prove other points depending on them, by a nearer and shorter view than remote and general maxims. These may serve as landmarks to shew what lies in the direct way of truth, or is quite beside it. And thus mathematicians do, who do not in every new problem run it back to the first axioms, through all the whole train of intermediate propositions. Certain theorems that they have settled to themselves upon sure demonstration, serve to resolve to them multitudes of propositions which depend on them, and are as firmly made out from thence, as if the mind went afresh over every link of the whole chain, that tie them to first self-evident principles. Only in other sciences great care is to be taken that they establish those intermediate principles, with as much caution, exactness, and indifferency, as mathematicians use in the settling any of their great theorems. When this is not done, but men take up the principles in this or that science upon credit, inclination, interest, &c. in haste, without due examination and most unquestionable proof, they lay a trap for themselves, and, as much as in them lies, captivate their understanding to mistake, falsehood, and error.

§ 22. *Partiality.*—As there is a partiality to opinions, which, as

we have already observed, is very apt to mislead the understanding; so there is often a partiality to studies, which is prejudicial also to knowledge and improvement. Those sciences which men are particularly versed in, they are apt to value and extol, as if that part of knowledge which every one has acquainted himself with, were that alone which was worth the having, and all the rest were idle and empty amusements, comparatively of no use or importance. This is the effect of ignorance, and not knowledge; the being vainly puffed up with a flatulency, arising from a weak and narrow comprehension. It is not amiss that every one should relish the science that he has made his peculiar study; a view of its beauties, and a sense of its usefulness, carries a man on with the more delight and warmth, in the pursuit and improvement of it. But the contempt of all other knowledge, as if it were nothing in comparison of law or physic, of astronomy or chemistry, or perhaps some yet meaner part of knowledge, wherein I have got some smattering, or am somewhat advanced, is not only the mark of a vain or little mind, but does this prejudice in the conduct of the understanding, that it coops it up within narrow bounds, and hinders it from looking abroad into other provinces of the intellectual world, more beautiful possibly, and more fruitful, than that which it had until then laboured in; wherein it might find, besides new knowledge, ways or hints whereby it might be enabled the better to cultivate its own.

§ 23. *Theology*.—There is indeed one science (as they are now distinguished) incomparably above all the rest, where it is not by corruption narrowed into a trade or faction, for mean or ill ends, and secular interests; I mean theology, which, containing the knowledge of God and his creatures, our duty to him and our fellow-creatures, and a view of our present and future state, is the comprehension of all other knowledge directed to its true end: *i. e.* the honour and veneration of the Creator, and the happiness of mankind. This is that noble study which is every man's duty, and every one that can be called a rational creature is capable of. The works of nature, and the words of revelation, display it to mankind in characters so large and visible, that those who are not quite blind, may in them read and see the first principles and most necessary parts of it; and from thence, as they have time and industry, may be enabled to go on to the more abstruse parts of it, and penetrate into those infinite depths, filled with the treasures of wisdom and knowledge. This is that science which would truly enlarge men's minds, were it studied or permitted to be studied, every where with that freedom, love of truth, and charity, which it teaches; and were not made, contrary to its nature, the occasion of strife, faction, or malignity, and narrow impositions. I shall say no more here of this, but that it is undoubtedly a wrong use of my understanding, to make it the rule and measure of another man's; a use which it is neither fit for, nor capable of.

§ 24. *Partiality*.—This partiality, where it is not permitted an authority to render all other studies insignificant or contemptible, is often indulged so far as to be relied upon, and made use of, in other parts of knowledge, to which it does not at all belong, and wherewith it has no manner of affinity. Some men have so used their heads to mathe-

matical figures, that giving a preference to the methods of that science, they introduce lines and diagrams into their study of divinity or politic inquiries, as if nothing could be known without them; and others, accustomed to retired speculations, run natural philosophy into metaphysical notions, and the abstract generalities of logic: and how often may one meet with religion and morality treated of in the terms of the laboratory, and thought to be improved by the methods and notions of chemistry! But he that will take care of the conduct of his understanding, to direct it right to the knowledge of things, must avoid these undue mixtures, and not, by a fondness for what he has found useful and necessary in one, transfer it to another science, where it serves only to perplex and confound the understanding. It is a certain truth, that *res nolunt male administrari*; it is no less certain, *res nolunt male intelligi*. Things themselves are to be considered as they are in themselves, and then they will shew us in what way they are to be understood. For to have right conceptions about them, we must bring our understandings to the inflexible natures and unalterable relations of things, and not endeavour to bring things to any preconceived notions of our own.

There is another partiality very commonly observable in men of study, no less prejudicial nor ridiculous than the former; and that is, a fantastical and wild attributing all knowledge to the ancients alone, or to the moderns. This raving upon antiquity in matter of poetry, Horace has wittily described and exposed in one of his satires. The same sort of madness may be found in reference to all the other sciences. Some will not admit an opinion not authorized by men of old, who were then all giants in knowledge. Nothing is to be put into the treasury of truth or knowledge, which has not the stamp of Greece or Rome upon it: and, since their days, will scarce allow that men have been able to see, think, or write. Others, with a like extravagancy, condemn all that the ancients have left us, and, being taken with the moderns' inventions and discoveries, lay by all that went before, as if whatever is called old must have the decay of time upon it, and truth too were liable to mould and rottenness. Men, I think, have been much the same for natural endowments in all times. Fashion, discipline, and education, have put eminent differences in the ages of several countries, and made one generation much differ from another in arts and sciences. But truth is always the same; time alters it not, nor is it the better or worse for being of ancient or modern tradition. Many were eminent in former ages of the world for their discovery and delivery of it; but though the knowledge they have left us be worth our study, yet they exhausted not all its treasure; they left a great deal for the industry and sagacity of after ages, and so shall we. That was once new to them which any one now receives with veneration for its antiquity; nor was it the worse for appearing as a novelty: and that which is now embraced for its newness, will, to posterity, be old, but not thereby be less true or less genuine. There is no occasion on this account to oppose the ancients and the moderns to one another, or to be squeamish on either side. He that wisely conducts his mind in the pursuit of knowledge, will gather what lights, and get what helps he can from

either of them, from whom they are best to be had, without adoring the errors, or rejecting the truths, which he may find mingled in them.

Another partiality may be observed, in some to vulgar, in others to heterodox, tenets. Some are apt to conclude, that what is the common opinion cannot but be true : so many men's eyes, they think, cannot but see right ; so many men's understandings of all sorts cannot be deceived ; and therefore will not venture to look beyond the received notions of the place and age, nor have so presumptuous a thought as to be wiser than their neighbours. They are content to go with the crowd, and so go easily, which they think is going right, or at least serves them as well. But however *vox populi vox Dei* has prevailed as a maxim, yet I do not remember where ever God delivered his oracles by the multitude, or nature truths by the herd. On the other side, some fly all common opinions as either false or frivolous. The title of many-headed beast is a sufficient reason to them to conclude, that no truths of weight or consequence can be lodged there. Vulgar opinions are suited to vulgar capacities, and adapted to the ends of those that govern. He that will know the truth of things, must leave the common and beaten track, which none but weak and servile minds are satisfied to trudge along continually in. Such nice palates relish nothing but strange notions quite out of the way ; whatever is commonly received, has the mark of the beast on it, and they think it a lessening to them to hearken to it, or receive it ; their mind runs only after paradoxes ; these they seek, these they embrace, these alone they vent, and so, as they think, distinguish themselves from the vulgar. But common or uncommon are not the marks to distinguish truth or falsehood, and therefore should not be any bias to us in our inquiries. We should not judge of things by men's opinions, but of opinions by things. The multitude reason but ill, and therefore may be well suspected, and cannot be relied on, nor should be followed as a sure guide ; but philosophers, who have quitted the orthodoxy of the community, and the popular doctrines of their countries, have fallen into as extravagant and as absurd opinions as ever common reception countenanced. It would be madness to refuse to breathe the common air, or quench one's thirst with water, because the rabble use them to these purposes : and if there are conveniences of life which common use reaches not, it is not reason to reject them, because they are not grown into the ordinary fashion of the country, and every villager doth not know them.

Truth, whether in or out of fashion, is the measure of knowledge, and the business of the understanding ; whatsoever is besides that, however authorized by consent, or recommended by rarity, is nothing but ignorance, or something worse.

Another sort of partiality there is, whereby men impose upon themselves, and by it make their reading little useful to themselves ; I mean the making use of the opinions of writers, and laying stress upon their authorities, wherever they find them favour their own opinions.

There is nothing almost has done more harm to men dedicated to letters, than giving the name of study to reading, and making a man of great reading to be the same with a man of great knowledge, or at least

to be a title of honour. All that can be recorded in writing, are only facts or reasonings. Facts are of three sorts :

1. Merely of natural agents, observable in the ordinary operations of bodies one upon another, whether in the visible course of things left to themselves, or in experiments made by men applying agents and patients to one another, after a peculiar and artificial manner.

2. Of voluntary agents, more especially the actions of men in society, which makes civil and moral history.

3. Of opinions.

In these three consists, as it seems to me, that which commonly has the name of learning ; to which, perhaps, some may add a distinct head of critical writings, which indeed at bottom is nothing but matter of fact, and resolves itself into this, that such a man, or set of men, used such a word or phrase in such a sense, *i. e.* that they made such sounds the marks of such ideas.

Under reasonings I comprehend all the discoveries of general truths made by human reason, whether found by intuition, demonstrations, or probable deductions. And this is that which is, if not alone knowledge (because the truth or probability of particular propositions may be known too), yet is, as may be supposed, most properly the business of those who pretend to improve their understandings, and make themselves knowing by reading.

Books and reading are looked upon to be the great helps of the understanding, and instruments of knowledge, as it must be allowed that they are ; and yet I beg leave to question whether these do not prove a hinderance to many, and keep several bookish men from attaining to solid and true knowledge. This I think I may be permitted to say, that there is no part wherein the understanding needs a more careful and wary conduct, than in the use of books ; without which they will prove rather innocent amusements than profitable employments of our time, and bring but small additions to our knowledge.

There is not seldom to be found even amongst those who aim at knowledge, who with an unwearied industry employ their whole time in books, who scarce allow themselves time to eat or sleep, but read, and read, and read on, but yet make no great advances in real knowledge, though there be no defect in their intellectual faculties, to which their little progress can be imputed. The mistake here is, that it is usually supposed that, by reading, the author's knowledge is transferred into the reader's understanding ; and so it is, but not by bare reading, but by reading and understanding what he writ. Whereby I mean not barely comprehending what is affirmed or denied in each proposition (though that great readers do not think themselves concerned precisely to do), but to see and follow the train of his reasonings, observe the strength and clearness of their connexion, and examine upon what they bottom. Without this a man may read the discourses of a very rational author, writ in a language and in propositions that he very well understands, and yet acquire not one jot of his knowledge ; which consisting only in the perceived, certain, or probable connexion of the ideas made use of in his reasonings, the reader's knowledge is no farther increased, than he

perceives that, so much as he sees of this connexion so much he knows of the truth or probability of that author's opinions.

All that he relies on without this perception, he takes upon trust upon the author's credit, without any knowledge of it at all. This makes me not at all wonder to see some men so abound in citations, and build so much upon authorities, it being the sole foundation on which they bottom most of their own tenets; so that in effect they have but a second-hand or implicit knowledge, *i. e.* are in the right, if such a one from whom they borrowed it were in the right in that opinion which they took from him: which indeed is no knowledge at all. Writers of this or former ages, may be good witnesses of matters of fact which they deliver, which we may do well to take upon their authority; but their credit can go no farther than this, it cannot at all affect the truth and falsehood of opinions, which have another sort of trial by reason, and proof which they themselves made use of to make themselves knowing, and so must others too that will partake in their knowledge. Indeed, it is an advantage that they have been at the pains to find out the proofs, and lay them in that order that may shew the truth and probability of their conclusions; and for this we owe them great acknowledgments, for saving us the pains in searching out those proofs which they have collected for us, and which possibly, after all our pains, we might not have found, nor been able to have set them in so good a light as that which they left them us in. Upon this account we are mightily beholden to judicious writers of all ages for those discoveries and discourses they have left behind them for our instruction, if we know how to make a right use of them; which is not to run them over in a hasty perusal, and perhaps lodge their opinions, or some remarkable passages, in our memories, but to enter into their reasonings, examine their proofs, and then judge of the truth or falsehood, probability or improbability, of what they advance; not by any opinion we have entertained of the author, but by the evidence he produces, and the conviction he affords us, drawn from things themselves. Knowing is seeing, and if it be so, it is madness to persuade ourselves that we do so by another man's eyes, let him use never so many words to tell us, that what he asserts is very visible. Until we ourselves see it with our own eyes, and perceive it by our own understandings, we are as much in the dark, and as void of knowledge, as before, let us believe any learned author as much as we will.

Euclid and Archimedes are allowed to be knowing, and to have demonstrated what they say: and yet whoever shall read over their writings without perceiving the connexion of their proofs, and seeing what they shew, though he may understand all their words, yet he is not the more knowing. He may believe, indeed, but does not know what they say, and so is not advanced one jot in mathematical knowledge by all his reading of those approved mathematicians.

§ 25. *Haste.* The eagerness and strong bent of the mind after knowledge, if not warily regulated, is often a hinderance to it. It still presses into farther discoveries and new objects, and catches at the variety of knowledge, and therefore often stays not long enough on what is before it, to look into it as it should, for haste to pursue what is yet out of sight. He that rides post through a country, may be able, from the

transient view, to tell how in general the parts lie, and may be able to give some loose description of here a mountain and there a plain, here a morass and there a river; woodland in one part, and savannas in another. Such superficial ideas and observations as these he may collect in galloping over it. But the more useful observations of the soil, plants, animals, and inhabitants, with their several sorts and properties, must necessarily escape him; and it is seldom men ever discover the rich mines, without some digging. Nature commonly lodges her treasure and jewels in rocky ground. If the matter be knotty, and the sense lies deep, the mind must stop and buckle to it, and stick upon it with labour and thought, and close contemplation; and not leave it until it has mastered the difficulty, and got possession of truth. But here care must be taken to avoid the other extreme: a man must not stick at every useless nicety, and expect mysteries of science in every trivial question or scruple that he may raise. He that will stand to pick up and examine every pebble that comes in his way, is as unlikely to return enriched and laden with jewels, as the other that travelled full speed. Truths are not the better nor the worse for their obviousness or difficulty, but their value is to be measured by their usefulness and tendency. Insignificant observations should not take up any of our minutes, and those that enlarge our views, and give light towards farther and useful discoveries, should not be neglected, though they stop our course, and spend some of our time in a fixed attention.

There is another haste that does often, and will mislead the mind, if it be left to itself and its own conduct. The understanding is naturally forward, not only to learn its knowledge by variety (which makes it skip over one to get speedily to another part of knowledge), but also eager to enlarge its views by running too fast into general observations and conclusions, without a due examination of particulars enough whereon to found those general axioms. This seems to enlarge their stock, but it is of fancies, not realities; such theories built upon narrow foundations stand but weakly, and if they fall not themselves, are at least very hardly to be supported against the assaults of opposition. And thus men being too hasty to erect to themselves general notions and ill-grounded theories, find themselves deceived in their stock of knowledge, when they come to examine their hastily-assumed maxims themselves, or to have them attacked by others. General observations drawn from particulars are the jewels of knowledge, comprehending great store in a little room; but they are therefore to be made with the greater care and caution, lest, if we take counterfeit for true, our loss and shame be the greater, when our stock comes to a severe scrutiny. One or two particulars may suggest hints of inquiry, and they do well who take those hints; but if they turn them into conclusions, and make them presently general rules, they are forward indeed; but it is only to impose on themselves by propositions assumed for truths without sufficient warrant. To make such observations, is, as has been already remarked, to make the head a magazine of materials, which can hardly be called knowledge, or at least it is but like a collection of lumber not reduced to use or order; and he that makes every thing an observation, has the same useless plenty, and much more falsehood mixed with it. The

extremes on both sides are to be avoided, and he will be able to give the best account of his studies, who keeps his understanding in the right mean between them.

§ 26. *Anticipation.*—Whether it be a love of that which brings the first light and information to their minds, and want of vigour and industry to inquire, or else that men content themselves with any appearance of knowledge, right or wrong, which, when they have once got, they will hold fast; this is visible, that many men give themselves up to the first anticipations of their minds, and are very tenacious of the opinions that first possess them; they are often as fond of their first conceptions as of their first-born, and will by no means recede from the judgment they have once made, or any conjecture or conceit which they have once entertained. This is a fault in the conduct of the understanding, since this firmness or rather stiffness of the mind is not from an adherence to truth, but a submission to prejudice. It is an unreasonable homage paid to prepossession, whereby we shew a reverence not to (what we pretend to seek) truth; but what by hap-hazard we chance to light on, be it what it will. This is visibly a preposterous use of our faculties, and is a downright prostituting of the mind, to resign it thus, and put it under the power of the first comer. This can never be allowed, or ought to be followed, as a right way to knowledge, until the understanding (whose business it is to conform itself to what it finds on the objects without), can by its own opinionatry change that, and make the unalterable nature of things comply with its own hasty determinations, which will never be. Whatever we fancy, things keep their course; and their habitudes, correspondences, and relations, keep the same to one another.

§ 27. *Resignation.*—Contrary to these, but a like dangerous excess on the other side, are those who always resign their judgment to the last man they heard or read. Truth never sinks into these men's minds, nor gives any tincture to them, but, cameleon like, they take the colour of what is laid before them, and as soon lose and resign it to the next that happens to come in their way. The order wherein opinions are proposed or received by us, is no rule of their rectitude, nor ought to be a cause of their preference. First or last in this case, is the effect of chance, and not the measure of truth or falsehood. This every one must confess, and therefore should, in the pursuit of truth, keep his mind free from the influence of any such accidents. A man may as reasonably draw cuts for his tenets, regulate his persuasion by the cast of a die, as take it up for its novelty, or retain it because it had his first assent, and he was never of another mind. Well-weighed reasons are to determine the judgment; those the mind should be always ready to hearken and submit to, and by their testimony and suffrage, entertain or reject any tenet indifferently, whether it be a perfect stranger, or an old acquaintance.

§ 28. *Practice.*—Though the faculties of the mind are improved by exercise, yet they must not be put to a stress beyond their strength. *Quid valeant humeri, quid ferre recusent*, must be made the measure of every one's understanding, who has a desire not only to perform well, but to keep up the vigour of his faculties, and not to balk his understanding by what is too hard for it. The mind, by being engaged in a task

beyond its strength, like the body strained by lifting at a weight too heavy, has often its force broken, and thereby gets an unaptness or an aversion to any vigorous attempt ever after. A sinew cracked seldom recovers its former strength, or at least the tenderness of the sprain remains a good while after, and the memory of it longer, and leaves a lasting caution in the man, not to put the part quickly again to any robust employment. So it fares in the mind; once jaded by an attempt above its power, it either is disabled for the future, or else checks it at any vigorous undertaking ever after, at least is very hardly brought to exert its force again on any subject that requires thought and meditation. The understanding should be brought to the difficult and knotty parts of knowledge, that try the strength of thought, and a full bent of the mind, by insensible degrees; and in such a gradual proceeding, nothing is too hard for it. Nor let it be objected, that such a slow progress will never reach the extent of some sciences. It is not to be imagined how far constancy will carry a man; however, it is better walking slowly in a rugged way, than to break a leg and be a cripple. He that begins with the calf may carry the ox: but he that will at first go to take up an ox, may so disable himself, as not to be able to lift up a calf after that. When the mind, by insensible degrees, has brought itself to attention and close thinking, it will be able to cope with difficulties, and master them without any prejudice to itself, and then it may go on roundly. Every abstruse problem, every intricate question, will not baffle, discourage, or break it. But though putting the mind unprepared upon an unusual stress, that may discourage or damp it for the future, ought to be avoided; yet this must not run it, by an over-great shyness of difficulties, into a lazy sauntering, about ordinary and obvious things, that demand no thought or application. This debases and enervates the understanding, makes it weak and unfit for labour. This is a sort of hovering about the surface of things, without any insight into them, or penetration; and when the mind has been once habituated to this lazy recumbency and satisfaction, on the obvious surface of things, it is in danger to rest satisfied there, and go no deeper, since it cannot do it without pains and digging. He that has for some time accustomed himself to take up with what easily offers itself at first view, has reason to fear he shall never reconcile himself to the fatigue of turning and tumbling things in his mind, to discover their more retired and more valuable secrets.

It is not strange that methods of learning, which scholars have been accustomed to in their beginning and entrance upon the sciences, should influence them all their lives, and be settled in their minds by an overruling reverence, especially if they be such as universal use has established. Learners must at first be believers, and their master's rules having been once made axioms to them, it is no wonder they should keep that dignity, and by that authority they have once got, mislead those who think it sufficient to excuse them, if they go out of their way in a well-beaten track.

§ 29. *Words.*—I have copiously enough spoken of the abuse of words in another place, and therefore shall upon this reflection, that the sciences are full of them, warn those that would conduct their un-

understandings right, not to take any term, howsoever authorized by the language of the schools, to stand for any thing, until they have an idea of it. A word may be of frequent use and great credit with several authors, and be by them made use of, as if it stood for some real being; but yet, if he that reads cannot frame any distinct ideas of that being, it is certain to him a mere empty sound without a meaning, and he learns no more by all that is said of it, or attributed to it, than if it were affirmed only of that bare empty sound. They who would advance in knowledge, and not deceive and swell themselves with a little articulated air, should lay down this as a fundamental rule, not to take words for things, nor suppose that names in books signify real entities in nature, until they can frame clear and distinct ideas of those entities. It will not perhaps be allowed, if I should set down *substantial forms* and *intentional species*, as such that may justly be suspected to be of this kind of insignificant terms. But this I am sure, to one that can form no determined ideas of what they stand for, they signify nothing at all; and all that he thinks he knows about them, is to him so much knowledge about nothing, and amounts at most but to learned ignorance. It is not without all reason supposed, that there are many such empty terms to be found in some learned writers, to which they had recourse to etch out their systems, where their understandings could not furnish them with conceptions from things. But yet I believe the supposing of some relatives in nature, answering these and the like words, have much perplexed some, and quite misled others in the study of nature. That which in any discourse signifies *I know not what*, should be considered *I know not when*. Where men have any conceptions, they can, if they are never so abstruse or abstracted, explain them and the terms they use for them. For our conceptions being nothing but ideas, which are all made up of simple ones; if they cannot give us the ideas their words stand for, it is plain they have none. To what purpose can it be to hunt after his conceptions, who has none, or none distinct? He that knew not what he himself meant by a learned term, cannot make us know any thing by his use of it, let us beat our heads about it never so long. Whether we are able to comprehend all the operations of nature and the manners of them, it matters not to inquire; but this is certain, that we can comprehend no more of them than we can distinctly conceive; and therefore to obtrude terms where we have no distinct conceptions, as if they did contain or rather conceal something, is but an artifice of learned vanity, to cover a defect in hypothesis, or our understandings. Words are not made to conceal, but to declare and shew something; where they are, by those who pretend to instruct, otherwise used, they conceal indeed something; but that which they conceal is nothing but the ignorance, error, or sophistry of the talker, for there is in truth nothing else under them.

§ 30. *Wandering*.—That there is a constant succession and flux of ideas in our minds, I have observed in the former part of this Essay, and every one may take notice of it in himself. This I suppose may deserve some part of our care in the conduct of our understandings: and I think it may be of great advantage, if we can by use get that power over our minds, as to be able to direct that train of ideas, that

so, since there will new ones perpetually come in our thoughts by a constant succession, we may be able by choice so to direct them, that none may come in view, but such as are pertinent to our present inquiry, and in such order as may be most useful to the discovery we are upon; or at least, if some foreign and unsought ideas will offer themselves, that yet we might be able to reject them, and keep them from taking off our minds from its present pursuit, and hinder them from running away with our thoughts quite from the subject in hand. This is not, I suspect, so easy to be done as perhaps may be imagined; and yet, for aught I know, this may be, if not the chief, yet one of the great differences that carry some men in their reasoning so far beyond others, where they seem to be naturally of equal parts. A proper and effectual remedy for this wandering of thoughts, I would be glad to find. He that shall propose such a one, would do great service to the studious and contemplative part of mankind, and perhaps help unthinking men to become thinking. I must acknowledge, that hitherto I have discovered no other way to keep our thoughts close to their business, but the endeavouring, as much as we can, and by frequent attention and application, getting the habit of attention and application. He that will observe children, will find that even when they endeavour their utmost, they cannot keep their minds from straggling. The way to cure it, I am satisfied, is not angry chiding or beating, for that presently fills their heads with all the ideas that fear, dread, or confusion can offer to them. To bring back gently their wandering thoughts, by leading them into the path, and going before them in the train they should pursue, without any rebuke, or so much as taking notice (where it can be avoided) of their roving, I suppose would sooner reconcile and inure them to attention, than all those rougher methods, which more distract their thought, and, hindering the application they would promote, introduce a contrary habit.

§ 31. *Distinction.*—Distinction and division are (if I mistake not the import of the words) very different things; the one being the perception of a difference that nature has placed in things, the other our making a division where there is yet none: at least, if I may be permitted to consider them in this sense, I think I may say of them, that one of them is the most necessary and conducive to true knowledge that can be; the other, when too much made use of, serves only to puzzle and confound the understanding. To observe every the least difference that is in things, argues a quick and clear sight, and this keeps the understanding steady and right in its way to knowledge. But though it be useful to discern every variety that is to be found in nature, yet it is not convenient to consider every difference that is in things, and divide them into distinct classes under every such difference. This will run us, if followed, into particulars (for every individual has something that differences it from another), and we shall be able to establish no general truths, or else at least shall be apt to perplex the mind about them. The collection of several things into several classes, gives the mind more general and larger views; but we must take care to unite them only in that, and so far as they do agree, for so far they may be united under the consideration. For entity itself, that comprehends all things, as

general as it is, may afford us clear and rational conceptions. If we would well weigh and keep in our minds what it is we are considering, that would best instruct us when we should or should not branch into farther distinctions, which are to be taken only from a due contemplation of things; to which there is nothing more opposite than the art of verbal distinctions, made at pleasure, in learned and arbitrarily invented terms, to be applied at a venture, without comprehending or conveying any distinct notions, and so altogether fitted to artificial talk, or empty noise in dispute, without any clearing of difficulties, or advance in knowledge. Whatsoever subject we examine, and would get knowledge in, we should, I think, make as general and as large as it will bear; nor can there be any danger of this, if the idea of it be settled and determined; for if that be so, we shall easily distinguish it from any other idea, though comprehended under the same name. For it is to fence against the entanglements of equivocal words, and the great art of sophistry which lies in them, that distinctions have been multiplied, and their use thought so necessary. But had every distinct abstract idea a distinct known name, there would be little need of these multiplied scholastic distinctions, though there would be nevertheless as much need still of the mind's observing the differences that are in things, and discriminating them thereon one from another. It is not therefore the right way to knowledge, to hunt after, and fill the head with, abundance of artificial and scholastic distinctions, wherewith learned men's writings are often filled; and we sometimes find what they treat of so divided and subdivided, that the mind of the most attentive reader loses the sight of it, as it is more than probable the writer himself did; for in things crumbled into dust, it is in vain to affect or pretend order, or expect clearness. To avoid confusion by too few or too many divisions, is a great skill in thinking as well as writing, which is but the copying our thoughts; but what are the boundaries of the mean between the two vicious excesses on both hands, I think is hard to set down in words: clear and distinct ideas is all that I yet know able to regulate it. But as to verbal distinctions received and applied to common terms, *i. e.* equivocal words, they are more properly, I think, the business of criticisms and dictionaries than of real knowledge and philosophy, since they, for the most part, explain the meaning of words, and give us their several significations. The dexterous management of terms, and being able to *fend* and *prove* with them, I know has and does pass in the world for a great part of learning; but it is learning distinct from knowledge, for knowledge consists only in perceiving the habitudes and relation of ideas one to another, which is done without words; the intervention of a sound helps nothing to it. And hence we see that there is least use of distinctions where there is most knowledge: I mean in mathematics, where men have determined ideas with known names to them; and so there being no room for equivocations, there is no need of distinctions. In arguing, the opponent uses as comprehensive and equivocal terms as he can, to involve his adversary in the doubtfulness of his expressions: this is expected, and therefore the answerer on his side makes it his play to distinguish as much as he can, and thinks he can never do it too much; nor can he indeed in that way wherein victory may be had

without truth and without knowledge. This seems to me to be the art of disputing. Use your words as captiously as you can in your arguing on one side, and apply distinctions as much as you can on the other side, to every term, to nonplus your opponent; so that in this sort of scholarship, there being no bounds set to distinguishing, some men have thought all acuteness to have lain in it; and therefore in all they have read or thought on, their great business has been to amuse themselves with distinctions, and multiply to themselves divisions, at least more than the nature of the thing required. There seems to me, as I said, to be no other rule for this, but a due and right consideration of things as they are in themselves. He that has settled in his mind determined ideas, with names affixed to them, will be able both to discern their differences one from another, which is really distinguishing; and where the penury of words affords not terms answering every distinct idea, will be able to apply proper distinguishing terms to the comprehensive and equivocal names he is forced to make use of. This is all the need I know of distinguishing terms; and in such verbal distinctions, each term of the distinction joined to that whose signification it distinguishes, is but a new distinct name for a distinct idea. Where they are so, and men have clear and distinct conceptions that answer their verbal distinctions, they are right, and are pertinent as far as they serve to clear any thing in the subject under consideration. And this is that which seems to me the proper and only measure of distinctions and divisions; which he that will conduct his understanding right, must not look for in the acuteness of invention, nor the authority of writers, but will find only in the consideration of things themselves, whether they are led into it by their own meditations or the information of books.

An aptness to jumble things together, wherein can be found any likeness, is a fault in the understanding on the other side, which will not fail to mislead it, and by thus lumping of things, hinder the mind from distinct and accurate conceptions of them.

§ 32. *Similes*.—To which let me here add another near of kin to this, at least in name, and that is, letting the mind, upon the suggestion of any new notion, run immediately after similes to make it the clearer to itself; which, though it may be a good way, and useful in the explaining our thoughts to others, yet it is by no means a right method to settle true notions of any thing in ourselves, because similes always fail in some part, and come short of that exactness which our conceptions should have to things, if we would think aright. This indeed makes men plausible talkers, for those are always most acceptable in discourse who have the way to let in their thoughts into other men's minds with the greatest ease and facility: whether those thoughts are well formed and correspond with things, matters not; few men care to be instructed but at an easy rate. They who in their discourse strike the fancy, and take the hearer's conceptions along with them as fast as their words flow, are the applauded talkers, and go for the only men of clear thoughts. Nothing contributes so much to this as similes, whereby men think they themselves understand better, because they are the better understood. But it is one thing to think right, and another thing to know the right way to lay our thoughts before others with advantage and

clearness, be they right or wrong. Well-chosen similes, metaphors, and allegories, with method and order, do this the best of any thing, because being taken from objects already known and familiar to the understanding, they are conceived as fast as spoken; and the correspondence being concluded, the thing they are brought to explain and elucidate is thought to be understood too. Thus fancy passes for knowledge, and what is prettily said is mistaken for solid. I say not this to decry metaphor, or with design to take away that ornament of speech; my business here is not with rhetoricians and orators, but with philosophers and lovers of truth; to whom I would beg leave to give this one rule whereby to try whether, in the application of their thoughts to any thing for the improvement of their knowledge, they do in truth comprehend the matter before them really such as it is in itself. The way to discover this is, to observe, whether in the laying it before themselves or others, they make use only of borrowed representations, and ideas foreign to the thing, which are applied to it by way of accommodation, as bearing some proportion of imagined likeness to the subject under consideration. Figured and metaphorical expressions do well to illustrate more abstruse and unfamiliar ideas, which the mind is not yet thoroughly accustomed to, but then they must be made use of to illustrate ideas that we already have, not to paint to us those which we yet have not. Such borrowed and allusive ideas may follow real and solid truth, to set it off when found, but must by no means be set in its place, and taken for it. If all our search has yet reached no farther than simile and metaphor, we may assure ourselves we rather fancy than know, and are not yet penetrated into the inside and reality of the thing, be it what it will, but content ourselves with what our imaginations, not things themselves, furnish us with.

§ 33. *Assent*.—In the whole conduct of the understanding, there is nothing of more moment than to know when and where, and how far, to give assent, and possibly there is nothing harder. It is very easily said, and nobody questions it, that giving and withholding our assent, and the degrees of it, should be regulated by the evidence which things carry with them; and yet we see men are not the better for this rule: some firmly embrace doctrines upon slight grounds, some upon no grounds, and some contrary to appearance, some admit of certainty, and are not to be moved in what they hold; others waver in every thing, and there want not those that reject all as uncertain. What then shall a novice, an inquirer, a stranger, do in this case? I answer, use his eyes. There is a correspondence in things, and agreement and disagreement in ideas, discernible in very different degrees, and there are eyes in men to see them, if they please, only their eyes may be dimmed or dazzled, and the discerning sight in them impaired or lost. Interest and passion dazzle; the custom of arguing on any side, even against our persuasions, dims the understanding, and makes it, by degrees, lose the faculty of discerning clearly between truth and falsehood, and so of adhering to the right side. It is not safe to play with error, and dress it up to ourselves or others in the shape of truth. The mind by degrees loses its natural relish of real solid truth, is reconciled insensibly to any thing that can but be dressed up into any faint appearance of it: and if the

fancy be allowed the place of judgment at first in sport, it afterward comes by use to usurp it; and what is recommended by this flatterer (that studies but to please), is received for good. There are so many ways of fallacy, such arts of giving colours, appearances, and resemblances, by this court-dresser, the fancy, that he who is not wary to admit nothing but truth itself, very careful not to make his mind subservient to any thing else, cannot but be caught. He that has a mind to believe, has half assented already; and he that, by often arguing against his own sense, imposes falsehoods on others, is not far from believing himself. This takes away the great distance there is betwixt truth and falsehood; it brings them almost together, and makes it no great odds, in things that approach so near, which you take; and when things are brought to that pass, passion or interest, &c. easily, and without being perceived, determine which shall be right.

§ 34. *Indifferency*.—I have said above, that we should keep a perfect indifferency for all opinions, not wish any of them true, or try to make them appear so; but being indifferent, receive and embrace them according as evidence, and that alone, gives the attestation of truth. They that do thus, *i. e.* keep their minds indifferent to opinions, to be determined only by evidence, will always find the understanding has perception enough to distinguish between evidence or no evidence, betwixt plain and doubtful; and if they neither give nor refuse their assent but by that measure, they will be safe in the opinions they have. Which being perhaps but few, this caution will have also this good in it, that it will put them upon considering, and teach them the necessity of examining more than they do; without which the mind is but a receptacle of inconsistencies, not the storehouse of truths. They that do not keep up this indifferency in themselves for all but truth, not supposed, but evidenced in themselves, put coloured spectacles before their eyes, and look on things through false glasses, and then think themselves excused in following the false appearances, which they themselves put upon them. I do not expect that by this way the assent should in every one be proportioned to the grounds and clearness wherewith every truth is capable to be made out, or that men should be perfectly kept from error: that is more than human nature can by any means be advanced to; I aim at no such unattainable privilege: I am only speaking of what they should do, who would deal fairly with their own minds, and make a right use of their faculties in the pursuit of truth; we fail them a great deal more than they fail us. It is mismanagement more than want of abilities that men have reason to complain of; and which they actually do complain of, in those that differ from them. He that by an indifferency for all but truth, suffers not his assent to go faster than his evidence, nor beyond it, will learn to examine, and examine fairly, instead of presuming, and nobody will be at a loss or in danger for want of embracing those truths, which are necessary in his station and circumstances. In any other way but this, all the world are born to orthodoxy; they imbibe at first the allowed opinions of their country and party, and so, never questioning their truth, not one of a hundred ever examines. They are applauded for presuming they are in the right. He that considers, is a foe to orthodoxy, because possibly he may deviate

from some of the received doctrines there. And thus men without any industry or acquisition of their own, inherit local truths (for it is not the same every where), and are inured to assent without evidence. This influences farther than is thought; for what one of a hundred of the zealous bigots in all parties ever examined the tenets he is so stiff in, or ever thought it his business or duty so to do? It is suspected of lukewarmness to suppose it necessary, and a tendency to apostacy to go about it. And if a man can bring his mind once to be positive and fierce for positions, whose evidence he has never once examined, and that in matters of greatest concernment to him, what shall keep him from this short and easy way of being in the right in cases of less moment? Thus we are taught to clothe our minds as we do our bodies, after the fashion in vogue, and it is accounted fantasticalness, or something worse, not to do so, this custom (which who dares oppose?) makes the short-sighted bigots, and the warier sceptics, as far as it prevails. And those that break from it are in danger of heresy; for, taking the whole world, how much of it doth truth and orthodoxy possess together? Though it is by the last alone (which has the good luck to be every where), that error and heresy are judged of; for argument and evidence signify nothing in the case, and excuse no where, but are sure to be borne down in all societies by the infallible orthodoxy of the place. Whether this be the way to truth and right assent, let the opinions that take place and prescribe in the several habitable parts of the earth, declare. I never saw any reason yet why truth might not be trusted to its own evidence: I am sure, if that be not able to support it, there is no fence against error, and then truth and falsehood are but names, that stand for the same things. Evidence, therefore, is that by which alone every man is (and should be) taught to regulate his assent, who is then, and then only, in the right way when he follows it.

Men deficient in knowledge are usually in one of these three states; either wholly ignorant, or as doubting of some proposition they have either embraced formerly, or at present are inclined to; or, lastly, they do with assurance hold and profess without ever having examined, and being convinced by well-grounded arguments.

The first of these are in the best state of the three, by having their minds yet in their perfect freedom and indifferency, the likelier to pursue truth the better, having no bias yet clapped on to mislead them.

§ 35. *Indifferency*.—For ignorance with an indifferency for truth is nearer to it, than opinion with ungrounded inclination, which is the great source of error; and they are more in danger to go out of the way, who are marching under the conduct of a guide, than he that has not yet taken a step, and is likelier to be prevailed on to inquire after the right way. The last of the three sorts are in the worst condition of all; for if a man can be persuaded and fully assured of any thing for a truth, without having examined, what is there that he may not embrace for truth? and if he has given himself up to believe a lie, what means is there left to recover one who can be assured without examining? To the other two this I crave leave to say, that as he that is ignorant is in the best state of the two, so he should pursue truth in a method suitable to that state, *i. e.* by

inquiring directly into the nature of the thing itself, without minding the opinions of others, or troubling himself with their questions or disputes about it, but to see what he himself can, sincerely searching after truth, find out. He that proceeds upon others' principles in his inquiry into any sciences, though he be resolved to examine them and judge of them freely, does yet at least put himself on that side, and post himself in a party which he will not quit until he be beaten out; by which the mind is insensibly engaged to make what defence it can, and so is unawares biassed. I do not say but a man should embrace some opinion when he has examined, else he examines to no purpose; but the surest and safest way is to have no opinion at all until he has examined, and that without any the least regard to the opinions or systems of other men about it. For example, were it my business to understand physic, would not the safe and readier way be to consult nature herself, and inform myself in the history of diseases and their cures; than, espousing the principles of the dogmatists, methodists, or chemists, to engage in all the disputes concerning either of those systems, and suppose it to be true, until I have tried what they can say to beat me out of it? Or, supposing that Hippocrates, or any other book, infallibly contains the whole art of physic, would not the direct way be to study, read, and consider that book, weigh and compare the parts of it, to find the truth, rather than espouse the doctrines of any party? who, though they acknowledge his authority, have already interpreted and wire-drawn all his text to their own sense; the tincture whereof, when I have imbibed, I am more in danger to misunderstand his true meaning, than if I had come to him with a mind unprepossessed by doctors and commentators of my sect, whose reasonings, interpretations, and language, which I have been used to, will of course make all chime that way, and make another, and perhaps the genuine meaning of the author, seem harsh, strained, and uncouth to me. For words having naturally none of their own, carry that signification to the hearer that he is used to put upon them, whatever be the sense of him that uses them. This, I think, is visibly so; and if it be, he that begins to have any doubt of any of his tenets, which he received without examination, ought, as much as he can, to put himself wholly into this state of ignorance in reference to that question, and throwing wholly by all his former notions, and the opinions of others, examine, with a perfect indifferency, the question in its source, without any inclination to either side, or any regard to his or others' unexamined opinions. This I own is no easy thing to do, but I am not inquiring the easy way to opinion, but the right way to truth; which they must follow who will deal fairly with their own understandings and their own souls.

§ 36. *Question.*—The indifferency that I here propose, will also enable them to state the question right, which they are in doubt about, without which they can never come to a fair and clear decision of it.

§ 37. *Perseverance.*—Another fruit from this indifferency, and the considering things in themselves, abstract from our own opinions and other men's notions, and discourses on them, will be that each man will pursue his thoughts in that method which will be most agreeable to the nature of the thing, and to his apprehension of what it suggests to him;

in which he ought to proceed with regularity and constancy, until he come to a well-grounded resolution wherein he may acquiesce. If it be objected, that this will require every man to be a scholar, and quit all his other business, and betake himself wholly to study, I answer, I propose no more to any one than he has time for. Some men's state and condition require no great extent of knowledge; the necessary provision for life swallows the greatest part of their time. But one man's want of leisure is no excuse for the oscitancy and ignorance of those who have time to spare; and every one has enough to get as much knowledge as is required and expected of him; and he that does not that, is in love with ignorance, and is accountable for it.

§ 38. *Presumption.*—The variety of distempers in men's minds is as great as of those in their bodies; some are epidemic, few escape them, and every one too, if he would look into himself, would find some defect of his particular genius. There is scarce any one without some idiosyncrasy, that he suffers by. This man presumes upon his parts, that they will not fail him at time of need, and so thinks it superfluous labour to make any provision beforehand. His understanding is to him like *Fortunatus's* purse, which is always to furnish him without ever putting any thing into it beforehand: and so he sits still satisfied without endeavouring to store his understanding with knowledge. It is the spontaneous product of the country, and what need of labour in tillage? Such men may spread their native riches before the ignorant; but they were best not to come to stress and trial with the skilful. We are born ignorant of every thing. The superficies of things that surround them, make impressions on the negligent; but nobody penetrates into the inside without labour, attention, and industry. Stones and timber grow of themselves; but yet there is no uniform pile, with symmetry and convenience to lodge in, without toil and pains. God has made the intellectual world harmonious and beautiful without us; but it will never come into our heads all at once; we must bring it home piecemeal, and there set it up by our own industry, or else we shall have nothing but darkness and a chaos within, whatever order and light there be in things without us.

§ 39. *Despondency.*—On the other side, there are others that depress their own minds, despond at the first difficulty, and conclude that the getting an insight in any of the sciences, or making any progress in knowledge, farther than serves their ordinary business, is above their capacities. These sit still, because they think they have not legs to go; as the others I last mentioned do, because they think they have wings to fly, and can soar on high when they please. To these latter one may for answer apply the proverb, *Use legs and have legs*. Nobody knows what strength of parts he has, until he has tried them. And of the understanding one may most truly say, that its force is greater generally than it thinks, until it is put to it. *Viresque acquirit eundo*.

And therefore the proper remedy here is but to set the mind to work, and apply the thoughts vigorously to the business; for it holds in the struggles of the mind, as in those of war, *Dum putant se vincere vicere*, a persuasion that we shall overcome any difficulties that we meet with in the sciences, seldom fails to carry us through them. Nobody knows

the strength of his mind, and the force of steady and regular application, until he has tried. This is certain, he that sets out upon weak legs, will not only go farther, but grow stronger too, than one with a vigorous constitution, and firm limbs, who only sits still.

Something of kin to this men may observe in themselves, when the mind frights itself (as it often does) with any thing reflected on in gross, and transiently viewed, confusedly, at a distance. Things thus offered to the mind, carry the show of nothing but difficulty in them, and are thought to be wrapped up in impenetrable obscurity. But the truth is, these are nothing but spectres that the understanding raises to itself, to flatter its own laziness. It sees nothing distinctly in things remote, and in a huddle, and therefore concludes too faintly, that there is nothing more clear to be discovered in them. It is but to approach nearer, and that mist of our own raising that enveloped them, will remove; and those that in the mist appeared hideous giants not to be grappled with, will be found to be of the ordinary and natural size and shape. Things that in a remote and confused view seem very obscure, must be approached by gentle and regular steps; and what is most visible, easy, and obvious in them, first considered. Reduce them into their distinct parts; and then in their due order bring all that should be known concerning every one of those parts, into plain and simple questions; and then, what was thought obscure, perplexed, and too hard for our weak parts, will lay itself open to the understanding in a fair view, and let the mind into that which before it was awed with, and kept at a distance from, as wholly mysterious. I appeal to my reader's experience, whether this has never happened to him, especially when busy on one thing, he has occasionally reflected on another. I ask him, whether he has never thus been scared with a sudden opinion of mighty difficulties, which yet have vanished when he has seriously and methodically applied himself to the consideration of this seeming terrible subject; and there has been no other matter of astonishment left, but that he amused himself with so discouraging a prospect of his own raising, about a matter which in the handling was found to have nothing in it more strange or intricate than several other things which he had long since, and with ease, mastered. This experience should teach us how to deal with such bugbears another time, which should rather serve to excite our vigour, than enervate our industry. The surest way for a learner, in this as in all other cases, is not to advance by jumps and large strides; let that which he sets himself to learn next, be indeed the next, *i. e.* as nearly conjoined with what he knows already as is possible; let it be distinct, but not remote from it: let it be new, and what he did not know before, that the understanding may advance; but let it be as little at once as it may be, that its advances may be clear and sure. All the ground that it gets this way it will hold. This distinct gradual growth in knowledge is firm and sure; it carries its own light with it in every step of its progression, in an easy and orderly train, than which there is nothing of more use to the understanding. And though this perhaps may seem a very slow and lingering way to knowledge, yet I dare confidently affirm, that whoever will try in himself, or any one he will teach, shall find the advances greater in this method,

than they would in the same space of time have been in any other he could have taken. The greatest part of true knowledge lies in a distinct perception of things in themselves distinct. And some men give more clear light and knowledge by the bare distinct stating of a question, than others by talking of it in gross whole hours together. In this, they who so state a question, do no more but separate and disentangle the parts of it one from another, and lay them, when so disentangled, in their due order. This often, without any more ado, resolves the doubt, and shews the mind where the truth lies. The agreement or disagreement of the idea in question, when they are once separated and distinctly considered, is in many cases presently perceived, and thereby clear and lasting knowledge gained; whereas things in gross taken up together, and so lying together in confusion, can produce in the mind but a confused, which in effect is no, knowledge; or at least, when it comes to be examined and made use of, will prove little better than none. I therefore take the liberty to repeat here again what I have said elsewhere, that in learning any thing, as little should be proposed to the mind at once, as is possible; and that being understood and fully mastered, to proceed to the next adjoining part yet unknown, simple, unperplexed proposition belonging to the matter in hand, and tending to the clearing what is principally designed.

§ 40. *Analogy*.—Analogy is of great use to the mind in many cases, especially in natural philosophy, and that part of it chiefly which consists in happy and successful experiments. But here we must take care that we keep ourselves within that wherein the analogy consists. For example, the acid oil of vitriol is found to be good in such a case, therefore the spirit of nitre or vinegar may be used in the like case. If the good effect of it be owing wholly to the acidity of it, the trial may be justified; but if there be something else besides the acidity in the oil of vitriol, which produces the good we desire in the case, we mistake that for analogy, which is not, and suffer our understanding to be misguided by a wrong supposition of analogy where there is none.

§ 41. *Association*.—Though I have in the second book of my Essay concerning Human Understanding, treated of the association of ideas; yet having done it there historically, as giving a view of the understanding in this as well as its several other ways of operating, rather than designing there to inquire into the remedies that ought to be applied to it; it will, under this latter consideration, afford other matter of thought to those who have a mind to instruct themselves thoroughly in the right way of conducting their understandings; and that the rather, because this, if I mistake not, is as frequent a cause of mistake and error in us, as perhaps any thing else that can be named, and is a disease of the mind as hard to be cured as any; it being a very hard thing to convince any one that things are not so, and naturally so, as they constantly appear to him.

By this one easy and unheeded miscarriage of the understanding, sandy and loose foundations become infallible principles, and will not suffer themselves to be touched or questioned: such unnatural connexions become by custom as natural to the mind, as sun and light: fire and warmth go together; and so seem to carry with them as natural an

evidence as self-evident truths themselves. And where, then, shall one with hopes of success begin the cure? Many men firmly embrace falsehood for truth, not only because they never thought otherwise, but also because, thus blinded as they have been from the beginning, they never could think otherwise; at least without a vigour of mind able to contest the empire of habit, and look into its own principles; a freedom which few men have the notion of in themselves, and fewer are allowed the practice of by others; it being the great art and business of the teachers and guides in most sects to suppress, as much as they can, this fundamental duty which every man owes himself, and is the first steady step towards right and truth in the whole train of his actions and opinions. This would give one reason to suspect that such teachers are conscious to themselves of the falsehood or weakness of the tenets they profess, since they will not suffer the grounds whereon they are built to be examined; when as those who seek truth only, and desire to own and propagate nothing else, freely expose their principles to the test, and are pleased to have them examined, give men leave to reject them if they can; and if there be any thing weak and unsound in them, are willing to have it detected, that they themselves, as well as others, may not lay any stress upon any received proposition beyond what the evidence of its truth will warrant and allow.

There is, I know, a great fault among all sorts of people, of principling their children and scholars: which, at last, when looked into, amounts to no more, but making them imbibe their teachers' notions and tenets, by an implicit faith, and firmly to adhere to them, whether true or false. What colours may be given to this, or of what use it may be when practised upon the vulgar, destined to labour, and given up to the service of their bellies, I will not here inquire. But as to the ingenious part of mankind, whose condition allows them leisure and letters, and inquiry after truth, I can see no other right way of principling them, but to take heed, as much as may be, that in their tender years, ideas that have no natural cohesion, come not to be united in their heads, and that this rule be often inculcated to them to be their guide in the whole course of their lives and studies, *viz.* that they never suffer any ideas to be joined in their understandings, in any other or stronger combination than what their own nature and correspondence give them; and that they often examine those that they find linked together in their minds, whether this association of ideas be from the visible agreement that is in the ideas themselves, or from the habitual and prevailing custom of the mind joining them thus together in thinking.

This is for caution against this evil, before it be thoroughly riveted by custom in the understanding; but he that would cure it when habit has established it, must nicely observe the very quick and almost imperceptible motions of the mind in its habitual actions. What I have said in another place about the change of the ideas of sense into those of judgment, may be proof of this. Let any one not skilled in painting, be told when he sees bottles and tobacco-pipes, and other things so painted, as they are in some places shewn, that he does not see protuberances, and you will not convince him but by the touch: he will not believe that by an instantaneous legerdemain of his own thoughts,

one idea is substituted for the other. How frequent instances may one meet with of this in the arguings of the learned, who not seldom in two ideas that they have been accustomed to join in their minds, substitute one for the other, and, I am apt to think, often without perceiving it themselves. This, whilst they are under the deceit of it, makes them incapable of conviction, and they applaud themselves as zealous champions of truth, when indeed they are contending for error. And the confusion of two different ideas, which a customary connexion of them in their minds hath made to them almost one, fills their heads with false views, and their reasonings with false consequences.

§ 42. *Fallacies*.—Right understanding consists in the discovery and adherence to truth, and that in the perception of the visible or probable agreement or disagreement of ideas, as they are affirmed and denied one of another. From whence it is evident, that the right use and conduct of the understanding, whose business is purely truth, and nothing else, is, that the mind should be kept in a perfect indifferency, not inclining to either side, and farther than evidence settles it by knowledge, or the overbalance of probability gives it the turn of assent and belief; but yet it is very hard to meet with any discourse, wherein one may not perceive the author not only maintain (for that is reasonable and fit), but inclined and biassed to one side of the question, with marks of a desire that it should be true.

If it be asked me, how authors who have such a bias, and lean to it, may be discovered; I answer, by observing how in their writings or arguings they are often led by their inclinations to change the ideas of the question, either by changing the terms, or by adding and joining others to them, whereby the ideas under consideration are so varied, as to be more serviceable to their purpose, and to be thereby brought to an easier and nearer agreement, or more visible and remoter disagreement one with another. This is plain and direct sophistry; but I am far from thinking, that wherever it is found it is made use of with design to deceive and mislead the readers.

It is visible that men's prejudices and inclinations by this way impose often upon themselves; and their affection for truth, under their prepossession in favour of one side, is the very thing that leads them from it. Inclination suggests and slides into their discourse favourable terms, which introduce favourable ideas, until at last by this means, that is concluded clear and evident, thus dressed up, which, taken in its native state, by making use of none but the precise determined ideas, would find no admittance at all. The putting those glosses on what they affirm, these, as they are thought handsome, easy, and graceful explications, of what they are discoursing on, is so much the character of what is called and esteemed writing well, that it is very hard to think that authors will ever be persuaded to leave what serves so well to propagate their opinions, and procure themselves credit in the world, for a mere jejune and dry way of writing, by keeping to the same terms precisely annexed to the same ideas; a sour and blunt stiffness tolerable in mathematicians only, who force their way, and make truth prevail by irresistible demonstration.

But yet if authors cannot be prevailed with to quit the looser, though more insinuating ways of writing, if they will not think fit to keep close

to truth and instruction by unvaried terms, and plain unsophisticated arguments, yet it concerns readers not to be imposed on by fallacies, and the prevailing ways of insinuation. To do this, the surest and most effectual remedy is to fix in the mind the clear and distinct ideas of the question stripped of words; and so likewise in the train of argumentation, to take up the author's ideas, neglecting his words, observing how they connect or separate those in the question. He that does this will be able to cast off all that is superfluous; he will see what is pertinent, what coherent, what is direct to, what slides by the question. This will readily shew him all the foreign ideas of the discourse, and where they are brought in: and though they perhaps dazzled the writer, yet he will perceive that they give no light nor strength to his reasonings.

This, though it be the shortest and easiest way of reading books with profit, and keeping one's self from being misled by great names of plausible discourses; yet it being hard and tedious to those who have not accustomed themselves to it; it is not to be expected that every one (amongst those few who really pursue truth) should this way guard his understanding from being imposed on by the wilful, or at least undesigned sophistry, which creeps into most of the books of argument. They that write against their conviction, or that next to them, are resolved to maintain the tenets of a party they are engaged in, cannot be supposed to reject any arms that may help to defend their cause, and therefore such should be read with the greatest caution. And they who write for opinions they are sincerely persuaded of, and believe to be true, think they may so far allow themselves to indulge their laudable affection to truth, as to permit their esteem of it to give it the best colours, and set it off with the best expressions and dress they can, thereby to gain it the easiest entrance into the minds of their readers and fix it deepest there.

One of those being the state of mind we may justly suppose most writers to be in, it is fit their readers, who apply to them for instruction, should not lay by that caution which becomes a sincere pursuit of truth, and should make them always watchful against whatever might conceal or misrepresent it. If they have not the skill of representing to themselves the author's sense by pure ideas separated from sounds, and thereby divested of the false lights and deceitful ornaments of speech; this yet they should do, they should keep the precise question steadily in their minds, carry it along with them through the whole discourse, and suffer not the least alteration in the terms, either by addition, subtraction, or substituting any other. This every one can do who has a mind to it; and he that has not a mind to it, it is plain makes his understanding only the warehouse of other men's lumber; I mean false and unconcluding reasonings, rather than a repository of truth for his own use, which will prove substantial, and stand instead when he has occasion for it. And whether such a one deals fairly by his own mind, and conducts his own understanding right, I leave to his own understanding to judge.

§ 43. *Fundamental verities.*—The mind of man being very narrow, and so slow in making acquaintance with things, and taking in new truths, that no one man is capable, in a much longer life than ours, to know all truths; it becomes our prudence in our search after knowledge, to

employ our thoughts about fundamental and material questions, carefully avoiding those that are trifling, and not suffering ourselves to be diverted from our main even purpose, by those that are merely incidental. How much of many young men's time is thrown away in purely logical inquiries, I need not mention. This is no better than if a man who was to be a painter, should spend all his time in examining the threads of the several cloths he is to paint upon, and counting the hairs of each pencil and brush he intends to use in the laying on of his colours. Nay, it is much worse than for a young painter to spend his apprenticeship in such useless niceties; for he, at the end of all his pains to no purpose, finds that it is not painting, nor any help to it, and so is really to no purpose. Whereas men designed for scholars have often their heads so filled and warmed with disputes on logical questions, that they take those airy useless notions for real and substantial knowledge, and think their understandings so well furnished with science, that they need not look any farther into the nature of things, or descend to the mechanical drudgery of experiment and inquiry. This is so obvious a mismanagement of the understanding, and that in the professed way to knowledge, that it could not be passed by; to which might be joined abundance of questions, and the way of handling them in the schools. What faults in particular of this kind every man is, or may be guilty of, would be infinite to enumerate, it suffices to have shewn that superficial and slight discoveries and observations that contain nothing of moment in themselves, nor serve as clues to lead us into farther knowledge, should be lightly passed by, and never thought worth our searching after.

There are fundamental truths that lie at the bottom, the basis upon which a great many others rest, and in which they have their consistency. These are teeming truths, rich in store, with which they furnish the mind; and, like the lights of heaven, are not only beautiful and entertaining in themselves, but give light and evidence to other things, that without them could not be seen or known. Such is that admirable discovery of Mr. Newton, that all bodies gravitate to one another, which may be counted as the basis of natural philosophy; which of what use it is to the understanding of the great frame of our solar system he has to the astonishment of the learned world shewn, and how much farther it would guide us in other things, if rightly pursued, is not yet known. Our Saviour's great rule, that *we should love our neighbour as ourselves*, is such a fundamental truth for the regulating human society; that, I think, that by that alone, one might, without difficulty, determine all the cases and doubts in social morality. These, and such as these, are the truths we should endeavour to find out, and store our minds with. Which leads me to another thing in the conduct of the understanding, that is no less necessary, viz.—

§ 44. *Bottoming*.—To accustom ourselves in any question proposed to examine and find out upon what it bottoms. Most of the difficulties that come in our way, when well considered and traced, lead us to some proposition, which known to be true, clears the doubt, and gives an easy solution of the question, whilst topical and superficial arguments, of which there is store to be found on both sides, filling the head with variety of thoughts, and the mouth with copious discourse, serve only to

amuse the understanding, and entertain company without coming to the bottom of the question, the only place of rest and stability for an inquisitive mind, whose tendency is only to truth and knowledge.

For example, if it be demanded, whether the Grand Seignior can lawfully take what he will from any of his people? This question cannot be resolved without coming to a certainty, whether all men are naturally equal; for upon that it turns, and that truth, well settled in the understanding, and carried in the mind through the various debates concerning the various rights of men in society, will go a great way in putting an end to them, and shewing on which side the truth is.

§ 45. *Transferring of thoughts.*—There is scarce any thing more for the improvement of knowledge, for the ease of life, and the dispatch of business, than for a man to be able to dispose of his own thoughts; and there is scarce any thing harder in the whole conduct of the understanding than to get a full mastery over it. The mind, in a waking man, has always some object that it applies to; which, when we are lazy or unconcerned, we can easily change, and at pleasure transfer our thoughts to another, and from thence to a third, which has no relation to either of the former. Hence men forwardly conclude, and frequently say, nothing is so free as thought, and it were well it were so; but the contrary will be found true in several instances; and there are many cases wherein there is nothing more restive and ungovernable than our thoughts: they will not be directed what objects to pursue, nor to be taken off from those they have once fixed on, but run away with a man in pursuit of those ideas they have in view, let him do what he can.

I will not here mention again what I have above taken notice of, how hard it is to get the mind narrowed by a custom of thirty or forty years standing to a scanty collection of obvious and common ideas, to enlarge itself to a more copious stock, and grow into an acquaintance with those that would afford more abundant matter of useful contemplation; it is not of this I am here speaking. The inconvenience I would here represent and find a remedy for, is the difficulty there is sometimes to transfer our minds from one subject to another, in cases where the ideas are equally familiar to us.

Matters that are recommended to our thoughts by any of our passions, take possession of our minds with a kind of authority, and will not be kept out or dislodged, but as if the passion that rules, were, for the time, the sheriff of the place, and came with all the posse, the understanding is seized and taken with the object it introduces, as if it had a legal right to be alone considered there. There is scarce any body, I think, of so calm a temper, who hath not sometime found this tyranny on his understanding, and suffered under the inconvenience of it. Who is there almost whose mind, at some time or other, love or anger, fear or grief, has not so fastened to some clog, that it could not turn itself to any other object. I call it a clog, for it hangs upon the mind so as to hinder its vigour and activity in the pursuit of other contemplations, and advances itself little or not at all in the knowledge of the thing which it so closely hugs and constantly pores on. Men thus possessed, are sometimes as if they were so in the worst sense, and lay under the power of an enchantment. They see not what passes before our eyes, hear

not the audible discourse of the company; and when, by any strong application to them they are roused a little, they are like men brought to themselves from some remote region; whereas, in truth, they come no farther than their secret cabinet within, where they have been wholly taken up with the puppet, which is for that time appointed for their entertainment. The shame that such dumps cause to well-bred people, when it carries them away from the company, where they should bear a part in the conversation, is a sufficient argument, that it is a fault in the conduct of our understanding, not to have that power over it as to make use of it to those purposes, and on those occasions wherein we have need of its assistance. The mind should be always free, and ready to turn itself to the variety of objects that occur, and allow them as much consideration as shall for that time be thought fit. To be engrossed so by one object, as not to be prevailed on to leave it for another that we judge fitter for our contemplation, is to make it of no use to us. Did this state of mind remain always so, every one would, without scruple, give it the name of perfect madness; and while it does last, at whatever intervals it returns, such a rotation of thoughts about the same subject no more carries us forwards towards the attainment of knowledge, than getting upon a mill-horse, whilst he jogs on his circular track, would carry a man a journey.

I grant something must be allowed to legitimate passions, and to natural inclinations.—Every man, besides occasional affections, has beloved studies, and those the mind will more closely stick to; but yet it is best that it should be always at liberty, and under the free disposal of the man, to act how, and upon what he directs. This we should endeavour to obtain, unless we would be content with such a flaw in our understandings, that sometimes we should be as it were without it; for it is very little better than so in cases where we cannot make use of it to those purposes we would, and which stand in present need of it.

But before fit remedies can be thought on for this disease, we must know the several causes of it, and thereby regulate the cure, if we will hope to labour with success.

One we have already instanced in, whereof all men that reflect have so general a knowledge, and so often an experience in themselves, that nobody doubts of it. A prevailing passion so pins down our thoughts to the object and concerns of it, that a man passionately in love cannot bring himself to think of his ordinary affairs; nor a kind mother drooping under the loss of a child, is not able to bear a part as she was wont in the discourse of the company or conversation of her friends.

But though passion be the most obvious and general, yet it is not the only cause that binds up the understanding, and confines it for the time to one object, from which it will not be taken off.

Besides this, we may often find that the understanding, when it has awhile employed itself upon a subject which either chance, or some slight accident, offered to it without the interest or recommendation of any passion, works itself into a warmth, and, by degrees, gets into a career, wherein, like a bowl down a hill, it increases its motion by going, and will not be stopped or diverted; though, when the heat is

over, it sees all this earnest application was about a trifle not worth a thought, and all the pains employed about it, lost labour.

There is a third sort, if I mistake not, yet lower than this; it is a sort of childishness, if I may so say, of the understanding, wherein during the fit, it plays with, and dandles some insignificant puppet to no end, nor with any design at all, and yet cannot easily be got off from it. Thus some trivial sentence or a scrap of poetry will sometimes get into men's heads, and make such a chiming there, that there is no stilling of it; no peace to be obtained, nor attention to any thing else, but this impertinent guest will take up the mind, and possess the thoughts in spite of all endeavours to get rid of it. Whether every one hath experimented in themselves this troublesome intrusion of some frisking ideas which thus importune the understanding, and hinder it from being better employed, I know not. But persons of very good parts, and those more than one I have heard speak and complain of it themselves. The reason I have to make this doubt, is from what I have known in a case something of kin to this, though much odder, and that is a sort of visions that some people have lying quiet but perfectly awake in the dark, or with their eyes shut. It is a great variety of faces, most commonly very old ones, that appear to them in a train one after another; so that having had just the sight of one, it immediately passes away to give place to another, that the same instant succeeds, and has as quick an exit as its leader, and so they march on in a constant succession; nor can any one of them by any endeavour be stopped or retained beyond the instant of its appearance, but is thrust out by its follower, which will have its turn. Concerning this fantastical phenomenon, I have talked with several people, whereof some have been perfectly acquainted with it, and others have been so wholly strangers to it, that they could hardly be brought to conceive or believe it. I know a lady of excellent parts who had got past thirty without having ever had the least notice of any such thing; she was so great a stranger to it, that when she heard me and another talking of it, could scarce forbear thinking we bantered her; but sometime after drinking a large dose of dilute tea (as she was ordered by a physician), going to bed, she told us at next meeting, that she had now experimented what our discourse had much ado to persuade her of. She had seen a great variety of faces in a long train, succeeding one another, as we had described; they were all strangers and intruders, such as she had no acquaintance with before, nor sought after them, and as they came of themselves, they went too; none of them staid a moment, nor could be detained by all the endeavours she could use, but went on in their solemn procession, just appeared and then vanished. This odd phenomenon seems to have a mechanical cause, and to depend upon the matter and motion of the blood or animal spirits.

When the fancy is bound by passion, I know no way to set the mind free and at liberty to prosecute what thoughts the man would make choice of, but to allay the present passion, or counterbalance it with another, which is an art to be got by study, and acquaintance with the passions.

Those who find themselves apt to be carried away with the spon-

taneous current of their own thoughts, not excited by any passion or interest, must be very wary and careful in all the instances of it to stop it, and never humour their minds in being thus triflingly busy. Men know the value of their corporal liberty, and therefore suffer not willingly fetters and chains to be put upon them. To have the mind captivated is, for the time, certainly the greater evil of the two, and deserves our utmost care and endeavours to preserve the freedom of our better part. And in this case our pains will not be lost; striving and struggling will prevail, if we constantly, in all such occasions, make use of it. We must never indulge these trivial attentions of thought; as soon as we find the mind makes itself a business of nothing, we should immediately disturb and check it, introduce new and more serious considerations, and not leave until we have beaten it off from the pursuit it was upon. This, at first, if we have let the contrary practice grow to a habit, will perhaps be difficult; but constant endeavours will by degrees prevail, and at the last make it easy. When a man is pretty well advanced, and can command his mind off at pleasure from incidental and undesigned pursuits, it may not be amiss for him to go on farther, and make attempts upon meditations of greater moment, that at the last he may have full power over his own mind, and be so fully master of his own thoughts, as to be able to transfer them from one subject to another, with the same ease that he can lay by any thing he has in his hand, and take something else that he has a mind to in the room of it. This liberty of mind is of great use both in business and study, and he that has got it will have no small advantage of ease and dispatch in all that is the chosen and useful employment of his understanding.

The third and last way which I mentioned the mind to be sometimes taken up with, I mean the chiming of some particular words or sentence in the memory, and, as it were, making a noise in the head, and the like, seldom happens but when the mind is lazy, or very loosely and negligently employed. It were better indeed be without such impertinent and useless repetitions: any obvious idea, when it is roving causelessly at a venture, being of more use and apter to suggest something worth consideration, than the insignificant buzz of purely empty sounds. But since the rousing of the mind, and setting the understanding on work with some degrees of vigour, does for the most part presently set it free from these idle companions, it may not be amiss, whenever we find ourselves troubled with them, to make use of so profitable a remedy that is always at hand.

INDEX.

- ABBOT of St. Martin, page 318, s. 26.
- Abstraction, 99, s. 9. puts a perfect distance betwixt men and brutes, *ib.* s. 10. what, 102, s. 1. how, *ib.* s. 1.
- Abstract ideas, why made, 267, s. 6; 268, s. 7, 8.
- Abstract terms cannot be affirmed one of another, 332, s. 1.
- Accident, 190, s. 2.
- Actions, the best evidence of men's principles, 35, s. 7. but two sorts of actions, 151, s. 4; 188, s. 11. unpleasant may be made pleasant, and how, 179, s. 69. cannot be the same in different places, 216, s. 2. considered as modes, or as moral, 248, s. 15.
- Adequate ideas, 260, s. 1, 2. we have not of any species of substances, 406, s. 26.
- Affirmations are only inconcrete, 332, s. 1.
- Agreement and disagreement of our ideas fourfold, 368, s. 3—7.
- Algebra, 471, s. 15.
- Alteration, 213, s. 2.
- Analogy, useful in natural philosophy; 482, s. 12.
- Anger, 149, s. 12, 14.
- Antipathy and sympathy, whence, 275, s. 7.
- Arguments of four sorts:—1. Ad verecundiam, 496, s. 19.—2. Ad ignorantiam, *ib.* s. 20.—3. Ad hominem, 497, s. 21.—4. Ad judicium, *ib.* s. 22. this alone right, *ib.*
- Arithmetic: the use of ciphers in arithmetic, 403, s. 19.
- Artificial things are most of them collective ideas, 209, s. 3. why we are less liable to confusion about artificial things, than about natural, 326, s. 40. have distinct species, 326, s. 41.
- Assent to maxims, 23, s. 10. upon hearing and understanding the terms, 26, s. 17, 18.
- Assent, a mark of self-evidence, 26, s. 18. not of innate, 26, s. 18—20; 55, s. 19.
- Assent to probability, 475, s. 3. ought to be proportioned to the proofs, 510, s. 1.
- Association of ideas, 274, s. 1, &c. this association how made, 275, s. 6. ill effects of it, as to antipathies, 275, s. 7, 8; 277, s. 15. and this in sects of philosophy and religion, 278, s. 18. its ill influence as to intellectual habits, *ib.* s. 17.
- Assurance, 479, s. 6.
- Atheism in the world, 48, s. 8.
- Atom, what, 217, s. 3.
- Authority; relying on others' opinions, one great cause of error, 518, s. 17.
- Beings, but two sorts, 452, s. 9. the eternal Being must be cogitative, *ib.* s. 10.
- Belief, what, 475, s. 3. to believe without reason, is against our duty, 497, s. 24.
- Best in our opinion, not a rule of God's actions, 51, s. 12.
- Blind man, if made to see, would not know which a globe, which a cube, by his sight, though he knew them by his touch, 63, s. 8.
- Blood, how it appears in a microscope, 197, s. 11.
- Brutes have no universal ideas, 99, s. 10, 11. abstract not, 99, s. 10.
- Body: we have no more primary ideas of body than of spirit, 200, s. 16. the primary ideas of body, *ib.* s. 17. the extension or cohesion of body, as hard to be understood, as the thinking of spirit, 201—204, s. 23—27. moving of body by body, as hard to be conceived as by spirit, 204, s. 28. operates only by impulse, 83, s. 11. what, 107, s. 11. the author's notion of the body, 2 Cor. v. 10, 230, and of his own body, 1 Cor. xv. 35, &c. 232. the meaning of the same body, 231. whether the word body be a simple or complex term, 232. this only a controversy about the sense of a word, 238.
- But, its several significations, 331, s. 5.
- Capacity, 104, s. 3.
- Capacities, to know their extent, useful, 14, s. 4. to cure scepticism and idleness, 15, s. 6. are suited to our present state, 14, s. 5. Cause, 213, s. 1. and effect, *ib.*
- Certainty depends on intuition, 374, s. 1. wherein it consists, 418, s. 18. of truth, 418, s. 1. to be had in very few general propositions, concerning substances, 476, s. 6. where to be had, 430, s. 16. verbal, 420, s. 7. real, 421, s. 8. sensible knowledge, the utmost certainty we have of existence, 458, s. 2. the author's notion of it not dangerous, 367, &c. how it differs from assurance, 479, s. 6.
- Changelings, whether men or no, 415, s. 13, 14.
- Clearness alone hinders confusion of ideas, 97, s. 3.
- Clear and obscure ideas, 251, s. 2.
- Colours, modes of colours, 144, s. 4.
- Comments upon law, why infinite, 336, s. 9.
- Complex ideas how made, 98, s. 6; 102, s. 1. in these the mind is more than passive, 102, s. 2. ideas reducible to modes, substances, and relations, 103, s. 3.
- Comparing ideas, 98, s. 4. herein men excel brutes, *ib.* s. 5.
- Compounding ideas, 98, s. 6. in this is a great difference between men and brutes, *ib.* s. 7.

- Compulsion, 154, s. 13.
 Confidence, 480, s. 7.
 Confusion of ideas, wherein it consists, 252, 253, s. 5—7. causes of confusion in ideas, 253, s. 7—9; 255, s. 12. of ideas, grounded on a reference to names, 254, 255, s. 10—12. its remedy, 255, s. 12.
 Confused ideas, 252, s. 4.
 Conscience is our own opinion of our own actions, 36, s. 8.
 Consciousness makes the same person, 221, s. 10, 224, s. 16. probably annexed to the same individual, immaterial substance, 228, s. 25. necessary to thinking, 63, s. 10, 11; 68, s. 19. what, *ib.* s. 19.
 Contemplation, 92, s. 1.
 Creation, 213, s. 2. not to be denied, because we cannot conceive the manner how, 141, s. 19.
 Definition, why the genus is used in definitions, 286, s. 10.
 Defining of terms would cut off a great part of disputes, 349, s. 15.
 Demonstration, 375, s. 3. not so clear as intuitive knowledge, *ib.* s. 4—6; 376, s. 7. intuitive knowledge necessary in each step of a demonstration, 376, s. 7. not limited to quantity, *ib.* s. 9. why that has been supposed, 377, s. 10. not to be expected in all cases, 461, s. 10. what, 474, s. 1; 471, s. 15.
 Desire, 148, s. 6. is a state of uneasiness, 161, s. 31, 32. is moved only by happiness, 165, s. 41. how far, *ib.* s. 43. how to be raised, 168, s. 46. misled by wrong judgment, 174, s. 60.
 Dictionaries, how to be made, 365, s. 25.
 Discerning, 96, s. 1. the foundation of some general maxims, 97, s. 1.
 Discourse cannot be between two men, who have different names for the same idea, or different ideas for the same name, 76, s. 5.
 Despair, 148, s. 11.
 Disposition, 187, s. 10.
 Disputing: the art of disputing prejudicial to knowledge, 262, s. 6—9. destroys the use of language, 269, s. 10.
 Disputes, whence, 350, s. 15. multiplicity of them owing to the abuse of words, 352, s. 22. are most about the signification of words, 358, s. 7.
 Distance, 104, s. 3.
 Distinct ideas, 252, s. 4.
 Divisibility of matter incomprehensible, 205, s. 31.
 Dreaming, 65, s. 13. seldom in some men, 65, s. 14.
 Dreams for the most part irrational, 67, s. 16. in dreams no ideas but of sensation or reflection, *ib.* s. 17.
 Duration, 114, s. 1, 2. whence we get the idea of duration, 114, 115, s. 3—5. not from motion, 118, s. 16. its measure, *ib.* s. 17, 18. any regular periodical appearance, 119, s. 19, 20. none of its measures known to be exact, 120, s. 21. we only guess them equal by the train of our ideas, *ib.* s. 21. minutes, days, years, &c. not necessary to duration, 121, s. 23. change of the measures of duration, change not the notion of it, *ib.* s. 23. the measures of duration, as the revolutions of the sun, may be applied to duration before the sun existed, 121—123, s. 24, 25, 28. duration without beginning, 122, s. 26. how we measure duration, *ib.* s. 27—29. recapitulation, concerning our ideas of duration, time, and eternity, 124, s. 31.
 Duration and expansion compared, 124, s. 1. they mutually embrace each other, 130, s. 12. considered as a line, 129, s. 11. duration not conceivable by us without succession, 130, s. 12.
 Education, partly the cause of unreasonableness, 274, s. 3.
 Effect, 213, s. 1.
 Enthusiasm, 504. described, 505, s. 6. its rise, *ib.* s. 5. ground of persuasion must be examined, and how, 506, s. 10. firmness of it, no sufficient proof, 508, s. 12, 13. fails of the evidence it pretends to, 507, s. 11.
 Envy, 149, s. 13, 14.
 Error, what, 510, s. 1. causes of error, *ib.* —1. Want of proofs, 511, s. 2.—2. Want of skill to use them, 512, s. 5.—3. Want of will to use them, 513, s. 6.—4. Wrong measures of probability, 513, s. 7. fewer men assent to errors, than is supposed, 519, s. 18.
 Essence, real and nominal, 292, s. 15. supposition of unintelligible, real essences of species, of no use, 293, s. 17. real and nominal essences, in simple ideas and modes always the same, in substance always different, 294, s. 18. essences, how ingenerable and incorruptible, *ib.* s. 19. specific essences of mixed modes are of men's making, and how, 301, s. 3. though arbitrary, yet not at random, 303, s. 7. of mixed modes, why called notions, 305, s. 12. what, 308, s. 2. relate only to species, 309, s. 4. real essences, what, 311, s. 6. we know them not, 311, s. 9. our specific essences of substances, nothing but collections of sensible ideas, 315, s. 21. nominal are made by the mind, 318, s. 26. but not altogether arbitrarily, 319, s. 28. nominal essences of substances, how made, 319, 320, s. 28, 29. are very various, 320, s. 30; 321, s. 31. of species, are the abstract ideas, the names stand for, 313, s. 12; 315, s. 19. are of man's making, 313, s. 12. but founded in the agreement of things, 314, s. 13. real essences determine not our species, 315, s. 18. every distinct, abstract idea, with a name, is a distinct essence of a distinct species, 8, s. 1. real essences of substances, not to be known, 428, s. 12.
 Essential, what, 308, s. 2; 309, s. 5. nothing essential to individuals, 309, s. 4. but to species, 310, s. 6.
 Essential difference, what, 309, s. 5.
 Eternal verities, 463, s. 14.
 Eternity, in our disputes and reasonings about it, why we are apt to blunder, 256, s. 15. whence we get its idea, 122, s. 27.
 Evil, what, 165, s. 42.

Existence, an idea of sensation and reflection, 80, s. 7. our own existence we know intuitively, 450, s. 2. and cannot doubt of it, *ib.* of creatable things, knowable only by our senses, 458, s. 1. past existence known only by memory, 462, s. 11.

Expansion, boundless, 125, s. 2. should be applied to space in general, 112, s. 27.

Experience often helps us, where we think not that it does, 89, s. 8.

Extasy, 147, s. 1.

Extension: we have no distinct ideas of very great, or very little extension, 256, s. 16. of body, incomprehensible, 201, s. 23, &c. denominations, from place and extension, are many of them relatives, 215, s. 5. and body not the same thing, 107, s. 11. its definition in signification, 108, s. 15. of body and of space how distinguished, 76, s. 5; 112, s. 27.

Faculties of the mind first exercised, 100, s. 14. are but powers, 155, s. 17. operate not, 156, s. 18, 20.

Faith and opinion, as distinguished from knowledge, what, 474, 475, s. 2, 3. and knowledge their difference, 475, s. 3. what, 483, s. 14. not opposite to reason, 497, s. 24. as contradistinguished to reason, what, 498, s. 2. cannot convince us of any thing contrary to our reason, 500, 501, &c. s. 5, 6, 8. matter of faith is only divine revelation, 501, s. 9. things above reason are only proper matters of faith, *ib.* s. 7; *ib.* s. 9.

Falsehood, what it is, 421, s. 9.

Fancy, 421, s. 8.

Fantastical ideas, 258, s. 1.

Fear, 148, s. 10.

Figure, 105, s. 5, 6.

Figurative speech, an abuse of language, 356, s. 34.

Finite, and infinite, modes of quantity, 133, s. 1. all positive ideas of quantity, finite, 136, s. 8.

Forms, substantial forms distinguish not species, 312, s. 10.

Free, how far a man is so, 157, s. 21. a man not free to will, or not to will, 157, 158, s. 22—24.

Freedom belongs only to agents, 156, s. 19. wherein it consists, 159, s. 27. free will, liberty belongs not to the will, 154, s. 14. wherein consists that which is called free will, 158, s. 24; 168, s. 47.

General ideas, how made, 99, s. 9. knowledge, what, 410, s. 31. propositions cannot be known to be true, without knowing the essence of the species, 422, s. 4. words, how made, 283, s. 6—8. belongs only to signs, 287, s. 11.

Gentlemen should not be ignorant, 513, s. 6.

Genus and species, what, 286, s. 10. are but Latin names for sorts, 304, s. 9. is but a partial conception of what is in the species, 322, s. 32. and species adjusted to the end of speech, 323, s. 33. and species are made in order to general names, 325, s. 39.

Generation, 215, s. 2.

God immovable, because infinite, 201, s. 21. fills immensity as well as eternity, 125, s. 3. his duration not like that of the creatures, 130, s. 12. an idea of God, not innate, 48, s. 8. the existence of a God evident, and obvious to reason, 50, s. 9. the notion of a God once got, is the likeliest to spread and be continued, 50, 51, s. 9, 10. idea of God late and imperfect, 52, s. 13. contrary, 53, s. 15, 16. inconsistent, 53, s. 15. the best notions of God, got by thought and application, 53, s. 15. notions of God frequently not worthy of him, 54, s. 16. the being of a God certain, *ib.* proved, 450, s. 1. as evident, as that the three angles of a triangle are equal to two right ones, 57, s. 22. yea, as that two opposite angles, are equal, 54, s. 16. more certain than any other existence without us, 451, s. 6. the idea of God not the only proof of his existence, 451, s. 7. the being of a God, the foundation of morality and divinity, *ib.* s. 7. how we make our idea of God, 206, s. 33, 34.

Gold is fixed; the various significations of this proposition, 329, s. 50. water strained through it, 76, s. 4.

Good and evil, what, 147, s. 2. 165, s. 42. the greater good determines not the will, 162, s. 35; 163, s. 38; 166, s. 44. why, *ib.* s. 44. 168, s. 46; 174, &c.; s. 59, 60, 64, 65, 68. two-fold, 175, s. 61. works on the will only by desire, 168, s. 46. desire of good, how to be raised, 168, s. 46, 47.

Habit, 187, s. 10.

Habitual actions pass often without our notice, 90, s. 10.

Hair, how it appears in a microscope, 197, s. 11.

Happiness, what, 165, s. 42. what happiness men pursue, 166, s. 43. how we come to rest in narrow happiness, 174, 175, s. 59, 60.

Hardness, what, 76, s. 4.

Hatred, 148, s. 5; 149, s. 14.

Heat and cold, how the sensation of them both is produced, by the same water, at the same time, 85, s. 21.

History, what history of most authority, 431, s. 11.

Hope, 148, s. 9.

Hypotheses, their use, 515, s. 11. are to be built on matter of fact, 63, s. 10.

Ice and water whether distinct species, 314, s. 13.

Idea, what, 89, s. 8.

Ideas, their original in children, 46, s. 2; 52, s. 13. none innate, 54, s. 17. because not remembered, 56, s. 20. are what the mind is employed about in thinking, 60, s. 1. all from sensation or reflection, 61, s. 2, &c. how this is to be understood, 383. their way of getting, observable in children, 62, s. 6. why some have more, some fewer, ideas, 62, s. 7. of reflection got late, and in some very negligently, 63, s. 8. their beginning and increase in chil-

- dren, 69, s. 21—24. their original in sensation and reflection, 70, s. 24. of one sense, 73, s. 1. want names, 74, s. 2. of more than one sense, 77. of reflection, 78, s. 1. of sensation and reflection, *ib.* s. 1. as in the mind, and in things, must be distinguished, 80, s. 7. not always resemblances, 84, s. 15, &c. which are first, is not material to know, 89, s. 7. of sensation often altered by the judgment, 89, s. 8. principally those of sight, 90, s. 9. of reflection, 100, s. 14. simple ideas men agree in, 113, s. 28. moving in a regular train in our minds, 116, s. 9. such as have degrees, want names, 144, s. 6. why some have names, and others not, *ib.* s. 7. original, 183, s. 73. all complex ideas resolvable into simple, 186, s. 9. what simple ideas have been most modified, 187, s. 10. our complex idea of God, and other spirits, common in every thing, but infinity, 207, s. 36. clear and obscure, 251, s. 2. distinct and confused, 252, s. 4. may be clear in one part, and obscure in another, 255, s. 13. real and fantastical, 258, s. 1. simple are all real, *ib.* s. 2. and adequate, 260, s. 2. what ideas of mixed modes are fantastical, 259, s. 4. what ideas of substances are fantastical, 259, s. 5. adequate and inadequate, 260, s. 1. how said to be in things, 260, s. 2. modes are all adequate ideas, 261, s. 3. unless as referred to names, 261, 262, s. 4, 5. of substances inadequate, 265, s. 11.—1. As referred to real essences, 262, s. 6; 264, s. 7.—2. As referred to a collection of simple ideas, 264, s. 8. simple ideas are perfect *ἐκτυπα*, 265, s. 12. of substances are perfect *ἐκτυπα*, 266, s. 13. of modes are perfect archetypes, 266, s. 14. true or false, 266, s. 1, &c. when false, 272, 273, s. 21—25. as bare appearances in the mind, neither true nor false, 267, s. 3. as referred to other men's ideas, or to real existence, or to real essences, may be true or false, 267, s. 4, 5. reason of such reference, 267, 268, s. 6—8. simple ideas referred to other men's ideas, least apt to be false, 268, s. 9. complex ones, in this respect, more apt to be false, especially those of mixed modes, 269, s. 10. simple ideas referred to existence, are all true, 269, s. 14; 270, s. 16. though they should be different in different men, 270, s. 15. complex ideas of modes are all true, 271, s. 17. of substances when false, 272, s. 21, &c. when right or wrong, 273, s. 26. that we are incapable of, 404, s. 23. that we cannot attain, because of their remoteness, 405, s. 24. because of their minuteness, 406, s. 25. simple have a real conformity to things, 411, s. 4. and all others, but of substances, 411, s. 5. simple cannot be got by definition of words, 298, s. 11. But only by experience, 299, s. 14. of mixed modes, why most compounded, 299, s. 13. specific, of mixed modes, how at first made: instance in kinneah and niouph, 327, s. 44, 45. of substances: instance in zabah, 328, s. 46; 329, s. 47. simple ideas and modes have all abstract, as well as concrete, names, 333, s. 2. of substances, have scarce any abstract names, 333. different in different men, 338, s. 13. our ideas almost all relative, 150, s. 3. particulars are first in the mind, 336, s. 9. general are imperfect, *ib.* s. 9. how positive ideas may be from private causes, 81, s. 4. the use of this term not dangerous, 81, 17, &c. It is fitter than the word notion, 82, 18. Other words as liable to be abused as this, *ib.* Yet it is condemned, both as new and not new, 19. the same with notion, sense, meaning, &c. 367.
- Identical propositions teach nothing, 443, s. 2.
- Identity, not an innate idea, 46, 47, s. 3—5. and diversity, 215, s. 1. of a plant, wherein it consists, 217, s. 4. of animals, 218, s. 5. of a man, *ib.* s. 6; 219, s. 8. unity of substance does not always make the same identity, 218, s. 7. personal identity, 220, s. 9. depends on the same consciousness, 221, s. 10. continued existence makes identity, 229, s. 29. and diversity, in ideas, the first perception of the mind, 370, s. 14.
- Idiots and madmen, 100, s. 12, 13.
- Ignorance, our ignorance infinitely exceeds our knowledge, 404, s. 22. causes of ignorance, *ib.* s. 23.—1. For want of ideas, *ib.*—2. For want of a discoverable connexion between the ideas we have, 407, s. 28.—3. For want of tracing the ideas we have, 409, s. 30.
- Illation, what, 484, s. 2.
- Immensity, 104, s. 4. how this idea is got, 134, s. 3.
- Immoralities of whole nations, 36, s. 9; 37, s. 11.
- Immortality, not annexed to any shape, 416, s. 15.
- Impenetrability, 46, s. 1.
- Imposition of opinions unreasonable, 478, s. 4.
- Impossibile est idem esse et non esse*, not the first thing known, 30, s. 25.
- Impossibility, not an innate idea, 46, s. 3.
- Impression on the mind, what, 21, s. 5.
- Inadequate ideas, 251, s. 1.
- Incompatibility, how far knowable, 400, s. 15.
- Individuationis principium*, is existence, 217, s. 3.
- Infalible judge of controversies, 51, s. 12.
- Inference, what, 473, s. 2—4.
- Infinite, why the idea of infinite not applicable to other ideas as well as those of quantity, since they can be as often repeated, 135, s. 6. the idea of infinity of space or number, and of space or number infinite, must be distinguished, 136, s. 7. our idea of infinite, very obscure, *ib.* s. 8. number furnishes us with the clearest ideas of infinite, 137, s. 9. the idea of infinite, a growing idea, 138, s. 12. our idea of infinite, partly positive, partly comparative, partly negative, 139, s. 15. why some men think they have an idea of infinite duration, but not of infinite space, 141, s. 20. why disputes about infinity are usually perplexed, 142, s. 21. our idea of infinity has its original in sensation and re-

fection, 143, s. 22. we have no positive idea of infinite, 138; s. 13, 14; 140, s. 16.

Infinity, why more commonly allowed to duration than to expansion, 125, s. 4. how applied to God by us, 133, s. 1. how we get this idea, 134, s. 2, 3. the infinity of number, duration, and space, different ways considered, 129, s. 10, 11.

Innate truths must be the first known, 31, s. 26. principles to no purpose, if men can be ignorant or doubtful of them, 39, s. 13. principles of my Lord Herbert examined, 40, s. 15, &c. moral rules to no purpose, if effaceable, or alterable, 43, s. 20. propositions must be distinguished from other by their clearness and usefulness, 58, s. 24. the doctrine of innate principles of ill consequence, ib.

Instant, what, 116, s. 10. and continual change, 117, s. 13—15.

Intuitive knowledge, 374, s. 1. our highest certainty, 494, s. 14.

Invention, wherein it consists, 95, s. 8.

Joy, 148, s. 7.

Iron, of what advantage to mankind, 468, s. 11.

Judgment: wrong judgments, in reference to good and evil, 174, s. 58. right judgment, 478, s. 4. one cause of wrong judgment, 477, s. 3. wherein it consists, 472, &c.

Knowledge has a great connexion with words, 354, s. 25. the author's definition of it explained and defended, 368, *note*. How it differs from faith, 474, 475, s. 2, 3; 368, *note*. what, 367, s. 2. how much our knowledge depends on our senses, 364, s. 23. actual, 372, s. 8. habitual, ib. s. 8. habitual, twofold, ib. s. 9. intuitive, 374, s. 1. intuitive, the clearest, ib. intuitive, irresistible, ib. demonstrative, ib. s. 2. of general truths, is all either intuitive or demonstrative, 378, s. 14. of particular existences, is sensitive, ib. clear ideas do not always produce clear knowledge, 379, s. 15. what kind of knowledge we have of nature, 511, s. 2. its beginning and progress, 101, s. 15—17; 25, s. 15, 16. given us, in the faculties to attain it, 51, s. 12. men's knowledge according to the employment of their faculties, 57, s. 22. to be got only by the application of our own thought to the contemplation of things, 58, s. 23. extent of human knowledge, 374. our knowledge goes not beyond our ideas, ib. s. 1. nor beyond the perception of their agreement or disagreement, ib. s. 2. reaches not to all our ideas, 375, s. 3. much less to the reality of things, ib. s. 6. yet very improvable if right ways are taken, ib. s. 6. of co-existence very narrow, 398, s. 9—11. and therefore, of substances very narrow, 399, &c. s. 14—16. of other relations indeterminate, 401, s. 18. of existence, 404, s. 21. certain and universal, where to be had, 408, s. 29. ill use of words, a great hindrance of knowledge, 409, s. 30. general, where to be got, 410, s. 31. lies only in our thoughts,

428, s. 15. reality of our knowledge, 410. of mathematical truths, how real, 412, s. 6. of morality, real, ib. s. 7. of substances, how far real, 414, s. 12. what makes our knowledge real, 411, s. 3. considering things, and not names, the way to knowledge, 415, s. 13. of substance, wherein it consists, 414, s. 11. what required to any tolerable knowledge of substances, 429, s. 14. self-evident, 430, s. 2. of identity and diversity, as large as our ideas, 397, s. 8; 431, s. 4. wherein it consists, ib. of co-existence, very scanty, 432, s. 5. of relations of modes, not so scanty, ib. s. 6. of real existence, none, 433, s. 7. begins in particulars, ib. s. 9. intuitive of our own existence, 449, s. 3. demonstrative of a God, ib. s. 1. improvement of knowledge, 464, not improved by maxims, ib. s. 1. why so thought, ib. 2. knowledge improved, only by perfecting and comparing ideas, 466, s. 6; 470, s. 14. and finding their relations, 466, s. 7. by intermediate ideas, 470, s. 14. in substances, how to be improved, 467, s. 9. partly necessary, partly voluntary, 471, s. 1, 2. why some, and so little, ib. s. 2. how increased, 479, s. 6.

Language, why it changes, 344, s. 1. wherein it consists, 279, s. 1—3. its use, 303, s. 7. its imperfections, 333, s. 1. double use, 334. the use of language destroyed by the subtilty of disputing, 346, s. 6; 347, s. 8. ends of language, 354, s. 23. its imperfections, not easy to be cured, 357, s. 2; ib. s. 4—6. the cure of them necessary to philosophy, 357, s. 3. to use no word without a clear and distinct idea annexed to it, is one remedy of the imperfections of language, 359, s. 8, 9. propriety in the use of words, another remedy, 360, s. 11.

Law of nature generally allowed, 35, s. 6. there is, though not innate, 39, s. 13. its enforcement, 243, s. 6.

Learning: the ill state of learning in these latter ages, 333, &c. of the schools lies chiefly in the abuse of words, 336, &c. such learning of ill consequence, 337, s. 10, &c.

Liberty, what, 152, 153, &c. s. 8—12; 155, s. 15. belongs not to the will, 154, s. 14. to be determined by the result of our own deliberation, is no restraint of liberty, 169, s. 43—50. founded in a power of suspending our particular desires, 168, s. 47; 170, s. 51, 52.

Light, its absurd definitions, 297, s. 10. light in the mind, what, 508, s. 13.

Logic has introduced obscurity into languages, 346, s. 6, 7. and hindered knowledge, ib. s. 7.

Love, 147, s. 4.

Madness, 100, s. 13. opposition to reason deserves that name, 274, s. 4.

Magisterial, the most knowing are least magisterial, 478, s. 4.

Making, 213, s. 2.

Man not the product of blind chance, 451, s. 6. the essence of man is placed in his shape, 417, s. 16. we know not his real essence, 308,

s. 3; 316, s. 22; 319, s. 27. the boundaries of the human species not determined, 319, s. 27. what makes the same individual man, 226, s. 21; 229, s. 29. the same man may be different persons, 225, s. 19.

Mathematics, their methods, 466, s. 7. improvement, 470, s. 15.

Matter, incomprehensible, both in its cohesion and divisibility, 201, s. 23; 205, s. 30, 31. what, 339, s. 15. whether it may think, is not to be known, 380, s. 6. cannot produce motion, or any thing else, 452, s. 10. and motion cannot produce thought, *ib.* not eternal, 456, s. 18.

Maxims, 430, &c.; 439, s. 12—15. not alone self-evident, 431, s. 3. are not the truths first known, 533, s. 9. not the foundation of our knowledge, 434, s. 10. wherein their evidence consists, *ib.* s. 10. their use, 435—439. s. 11, 12. why the most general self-evident propositions alone pass for maxims, 435, s. 11. are commonly proofs, only where there is no need of proofs, 441, s. 15. of little use, with clear terms, 442, s. 19. of dangerous use, with doubtful terms, 439, s. 12; 442, s. 20. when first known, 23, &c. s. 9—13; 24, s. 14; 25, s. 16. how they gain assent, 28, s. 21, 22. made from particular observations, *ib.* not in the understanding before they are actually known, 28, s. 22. neither their terms nor ideas innate, 29, s. 23. least known to children and illiterate people, 31, s. 27.

Memory, 92, s. 2. attention, pleasure, and pain, settled ideas in the memory, 93, s. 3. and repetition, *ib.* s. 4; 94, s. 6. difference of, 93, s. 4, 5. in remembrance, the mind sometimes active, sometimes passive, 94, s. 7. its necessity, 93, s. 5; 95, s. 8. defects, 95, s. 8, 9. in brutes, 96, s. 10.

Metaphysics, and school divinity, filled with unconstructive propositions, 447, s. 9.

Method used in mathematics, 466, s. 7.

Mind, the quickness of its actions, 90, s. 10.

Minutes, hours, days, not necessary to duration, 121, s. 23.

Miracles, 483, s. 13.

Misery, what, 165, s. 42.

Modes, mixed, 184, s. 1. made by the mind, *ib.* s. 2. sometimes got by the explication of their names, 183, s. 3. whence its unity, *ib.* s. 4. occasion of mixed modes, *ib.* s. 5. their ideas, how got, 186, s. 9. modes simple and complex, 103, s. 5. simple modes, 104, s. 1. of motion, 143, s. 2.

Moral good and evil, what, 243, s. 5. three rules whereby men judge of moral rectitude, 244, s. 7. beings, how founded on simple ideas of sensation and reflection, 248, s. 14, 15. rules not self-evident, 34, s. 4. variety of opinions concerning moral rules, 34, 35, s. 5, 6. rules, if innate, cannot with public allowance be transgressed, 37—39, s. 11, 13.

Morality, capable of demonstration, 495, s. 16; 401, s. 18; 467, s. 8. the proper study of mankind, 468, s. 11. of actions, in their conformity to a rule, 248, s. 15. mistakes in moral notions, owing to names, 249, s. 16.

discourses in morality, if not clear, the fault of the speaker, 362, s. 17. hinderances of demonstrative treating of morality: 1. Want of marks;—2. Complexedness, 402, s. 19;—3. Interest, 403, s. 20. change of names in morality, changes not the nature of things, 413, s. 9. and mechanism, hard to be reconciled, s. 14. secured amidst men's wrong judgments, 180, s. 70.

Motion, slow or very swift, why not perceived, 116, s. 7. 11. voluntary, inexplicable, 457, s. 19. its absurd definitions, 296, s. 8, 9.

Naming of ideas, 99, s. 8.

Names, moral, established by law, not to be varied from, 414, s. 10. of substances, standing for real essences, are not capable to convey certainty to the understanding, 419, s. 5. for nominal essences, will make some, though not many certain propositions, 420, s. 6. why men substitute names for real essences, which they know not, 351, s. 19. two false suppositions, in such a use of names, 352, s. 21. a particular name to every particular thing impossible, 284, s. 2. and useless, *ib.* s. 3. proper names, where used, 285, s. 4, 5. specific names are affixed to the nominal essence, 293, s. 16. of simple ideas and substances, refer to things, 295, s. 2. what names stand for both real and nominal essence, *ib.* s. 3. of simple ideas not capable of definitions, *ib.* s. 4. why, 296, s. 7. of least doubtful significations, 299, s. 15. have few accents in *linea predicamentali*, 300, s. 16. of complex ideas, may be defined, 298, s. 12. of mixed modes stand for arbitrary ideas, 301, s. 2, 3; 327, s. 44. tie together the parts of their complex ideas, 304, s. 10. stand always for the real essence, 306, s. 14. why got, usually, before the ideas are known, *ib.* s. 15. of relations comprehended under those of mixed modes, 307, s. 16. general names of substances stand for sorts, 308, s. 1. necessary to species, 325, s. 39. proper names belong only to substances, 326, s. 42. of modes in their first application, 327, s. 44, 45. of substances in their first application, 328, s. 46, 47. specific names stand for different things in different men, 329, s. 48. are put in the place of the thing supposed to have the real essence of the species, *ib.* s. 49. of mixed modes, doubtful often, 335, s. 6. because they want standards in nature, *ib.* s. 7. of substances, doubtful, 337, &c. s. 11, 14. in their philosophical use, hard to have settled significations, 339, s. 15. instance, liquor, 340, s. 16; gold, *ib.* s. 17. of simple ideas, why least doubtful, 341, s. 18. least compounded ideas have the least dubious names, 342, s. 19.

Natural philosophy, not capable of science, 406, s. 26; 468, s. 10. yet very useful, 469, s. 12. how to be improved, *ib.* what has hindered its improvement, *ib.* s. 12.

Necessity, 154, s. 13.

Negative terms, 279, s. 4. names signify the absence of positive ideas, 81, s. 5.

Newton, 435, s. 11.

Nothing; that nothing cannot produce any thing, is demonstration, 450, s. 3.

Notions, 184, s. 2.

Number, 130, modes of, the most distinct ideas, 185, s. 3. demonstrations in numbers, the most determinate, 185, s. 4. the general measure, 133, s. 8. affords the clearest idea of infinity, 137, s. 9. numeration, what, 131, s. 5. names necessary to it, *ib.* s. 5, 6. and order, 132, s. 7. why not early in children, and in some never, *ib.*

Obscurity, unavoidable in ancient authors, 337, s. 10. the cause of it in our ideas, 252, s. 3.

Obstinate, they are most, who have least examined, 477, s. 3.

Opinion, what, 475, s. 3. how opinions grow up to principles, 44, &c. s. 22—26. of others, a wrong ground of assent, 476, s. 6; 518, s. 17.

Organs; our organs suited to our state, 516, &c. s. 12, 13.

Pain, present, works presently, 176, s. 64. its use, 79, s. 4.

Parrot, mentioned by Sir W. T. 219, s. 8. holds a rational discourse, 220.

Particles join parts, or whole sentences, together, 330, s. 1. in them lies the beauty of well speaking, 331, s. 2. how their use is to be known, *ib.* s. 3. they express some action or posture of the mind, *ib.* s. 4.

Pascal, his great memory, 95, s. 9.

Passion, 188, s. 11.

Passions, how they lead us into error, 481, s. 11. turn on pleasure and pain, 147, s. 3. are seldom single, 164, s. 39.

Perception, threefold, 152, s. 5. in perception, the mind for the most part passive, 88, s. 1. is an impression made on the mind, *ib.* s. 3, 4. in the womb, 89, s. 5. difference between it, and innate ideas, *ib.* s. 6. puts the difference between the animal and vegetable kingdom, 91, s. 11. the several degrees of it, shew the wisdom and goodness of the Maker, *ib.* s. 12. belongs to all animals, 91, s. 12—14. the first inlet of knowledge, 92, s. 15.

Person, what, 220, s. 9. a forensic term, 228, s. 26. the same consciousness alone makes the same person, 222, s. 13; 227, s. 23. the same soul, without the same consciousness, makes not the same person, 223, s. 14. &c. reward and punishment follow personal identity, 225, s. 18.

Phantastical ideas, 258, s. 1.

Place, 105, s. 7, 8. use of place, 106, s. 9. nothing but relative position, 107, s. 10. sometimes taken for the space body fills, *ib.* twofold, 126, s. 6; *ib.* s. 6, 7.

Pleasure and pain, 147, s. 1; 149, s. 15, 16. join themselves to most of our ideas, 78, s. 2.

Pleasure, why joined to several actions, 78, s. 3.

Power, how we come by its idea, 150, s. 1. active and passive, *ib.* s. 2. no passive power

in God, no active in matter; both active and passive in spirits, *ib.* s. 2. our idea of active power clearest from reflection, 151, s. 4. powers operate not on powers, 156, s. 18. make a great part of the ideas of substances, 195, s. 7. why, 196, s. 8. an idea of sensation and reflection, 80, s. 8.

Practical principles not innate, 32, s. 1. not universally assented to, 33, s. 2. are for operation, *ib.* s. 3. not agreed, 40, s. 14. different, 43, s. 21.

Principles, not to be received without strict examination, 465, s. 4; 514, s. 8. the ill consequences of wrong principles, 514, &c. s. 9, 10. none innate, 20, s. 1. none universally assented to, 21, s. 2—4. how ordinarily got, 44, s. 22, &c. are to be examined, 45, s. 26, 27. not innate, if the ideas they are made up of, are not innate, 46, s. 1.

Private terms, 279, s. 4.

Probability, what, 474, &c. s. 1, 3. the grounds of probability, 475, s. 4. in matter of fact, 479, s. 6. how we are to judge in probabilities, 475, s. 5. difficulties in probabilities, 480, s. 9. grounds of probability in speculation, 482, s. 12. wrong measures of probability, 513, s. 7. how evaded by prejudiced minds, 516, s. 13, 14.

Proofs, 375, s. 3.

Properties of specific essences, not known, 315, s. 19. of things very numerous, 265, s. 10; 273, s. 24.

Propositions, identical, teach nothing, 458, s. 2. general, teach nothing, 445, s. 4; 448, s. 13. wherein a part of the definition is predicated of the subject, teach nothing, 445, 446, s. 5, 6. but the signification of the word, 446, s. 7. concerning substances, generally either trifling or uncertain, 447, s. 9. merely verbal, how to be known, 448, s. 12. abstract terms, predicated one of another, produce merely verbal propositions, *ib.* or part of a complex idea, predicated of the whole, 445, s. 4; 448, s. 13. more propositions, merely verbal, than is suspected, 448, s. 13. universal propositions concern not existence, 449, s. 1. what propositions concern existence, *ib.* certain propositions, concerning existence, are particular; concerning abstract ideas, may be general, 454, s. 13. mental, 418, s. 3; 419, s. 5. verbal, 418, s. 3; 419, s. 5. mental, hard to be treated, 418, s. 3, 4.

Punishment, what, 243, s. 5. and reward, follow consciousness, 225, s. 18; 228, s. 26. an unconscious drunkard, why punished, 226, s. 22.

Qualities: secondary qualities, their connexion, or inconsistency, unknown, 398, s. 11. of substances, scarce knowable, but by experience, 399, &c. s. 14, 16. of spiritual substances less than of corporeal, 401, s. 17. secondary, have no conceivable connexion with the primary, that produce them, 398, &c. s. 12, 13; 407, s. 28. of substances, depend on remote causes, 414, s. 11. not to be known by descriptions, 364, s. 21. secondary,

- how far capable of demonstration, 377, 378, s. 11—13. what, 82, s. 19; 14, s. 16. how said to be in things, 258, s. 2. secondary, would be other, if we could discover the minute parts of bodies, 197, s. 11. primary, 82, s. 9. how they produce ideas in us, 83, s. 11, 12. secondary qualities, 83, 84, s. 13—15. primary qualities resemble our ideas, secondary not, 84, &c. s. 15, 16. &c. three sorts of qualities in bodies, 86, s. 23. i. e. primary, secondary, immediately perceivable; and secondary, mediately perceivable, 87, s. 26. secondary are bare powers, 86, 87, &c. s. 23—25. secondary have no discernible connexion with the first, 87, s. 25.
- Quotations, how little to be relied on, 481, s. 11.
- Real ideas, 266, s. 1, 2.
- Reason, its various significations, 484, s. 1. what, *ib.* s. 2. reason is natural revelation, 505, s. 4. it must judge of revelation, 516, s. 14, 15. it must be our last guide in every thing, *ib.* four parts of reason, 485, s. 3. where reason fails us, 493, s. 9. necessary in all but intuition, 493, s. 15. as contra-distinguished to faith, what, 498, s. 2. helps us not to the knowledge of innate truths, 21, 22, s. 5—8. general ideas, general terms, and reason, usually grow together, 25, s. 15.
- Recollection, 145, s. 1.
- Reflection, 61, s. 4.
- Related, 209, s. 1.
- Relation, *ib.* proportional, 242, s. 1. natural, *ib.* s. 2. instituted, 243, s. 3. moral, *ib.* s. 4. numerous, 249, s. 17. terminate in simple ideas, 250, s. 18. our clear ideas of relation, *ib.* s. 19. names of relations doubtful, *ib.* s. 19. without correlative terms, not so commonly observed, 210, s. 2. different from the things related, *ib.* s. 4. changes without any change in the subject, *ib.* s. 5. always between two, 211, s. 6. all things capable of relation, *ib.* s. 7. the idea of the relation, often clearer than of the things related, *ib.* s. 8. all terminate in simple ideas of sensation and reflection, 212, s. 9.
- Relative, 209, s. 1. same relative terms taken for external denominations, 210, s. 2. some for absolute, *ib.* s. 3. how to be known, 212, s. 10. many words, though seeming absolute, are relatives, 210, s. 3—5.
- Religion, all men have time to inquire into, 511, s. 3. but in many places are hindered from inquiring, 512, s. 4. remembrance, of great moment in common life, 95, s. 8. what, 56, s. 20; 94, s. 7.
- Reputation, of great force in common life, 247, s. 12.
- Restraint, 154, s. 15.
- Resurrection, the author's notion of it, 232, &c. not necessarily understood of the same body, *ib.* &c. the meaning of his body, 2 Cor. v. 10, 231. the same body of Christ arose, and why, 233, 234. how the scripture speaks about it, 241.
- Revelation, an unquestionable ground of assent, 483, s. 14. belief, no proof of it, 509, s. 15. traditional revelation cannot convey any new simple ideas, 498, s. 3. not so sure as our reason or senses, 499, s. 4. in things of reason no need of revelation, 500, s. 5. cannot overrule our clear knowledge, *ib.* s. 5; 503, s. 10. must overrule probabilities of reason, 502, s. 8, 9.
- Reward, what, 243, s. 5.
- Rhetoric, an art of deceiving, 356, s. 34.
- Sagacity, 375, s. 3.
- Same, whether substance, mode, or concrete, 229, s. 28.
- Sand, white to the eye, pellucid, in a microscope, 197, s. 11.
- Sceptical, no one so sceptical as to doubt his own existence, 450, s. 2.
- Schools wherein faulty, 346, s. 6, &c.
- Science, divided into a consideration of nature, of operation, and of signs, 519. no science of natural bodies, 406, s. 26.
- Scripture; interpretations of scripture not to be imposed, 343, s. 23.
- Self, what makes it, 225, s. 20; 227, 228, s. 23—25.
- Self-love, 274, s. 2. partly cause of unreasonableness in us, *ib.*
- Self-evident propositions, where to be had, 430, &c. neither needed nor admitted proof, 442, s. 19.
- Sensation, 61, s. 3. distinguishable from other perceptions, 378, s. 14. explained, 85, s. 21, what, 145, s. 1.
- Senses: why we cannot conceive other qualities, than the objects of our senses, 73, s. 5. learn to discern by exercise, 364, s. 21. much quicker would not be useful to us, 516, s. 12. our organs of sense suited to our state, *ib.* &c. s. 12, 13.
- Sensible knowledge is as certain as we need, 460, s. 8. sensible knowledge goes not beyond the present act, 461, s. 9.
- Shame; 149, s. 17.
- Simple ideas, 70, s. 1. not made by the mind, 71, s. 2. power of the mind over them, 104, s. 1. the materials of all our knowledge, 80, s. 10. all positive, *ib.* very different from their causes, 81, s. 2, 3.
- Sin, with different men, stands for different actions, 42, s. 19.
- Solidity, 74, s. 1. inseparable from body, *ib.* by it body fills space, 75, s. 2. this idea got by touch, 74, s. 1. how distinguished from space, 75, s. 3. how from hardness, 76, s. 4.
- Something from eternity, demonstrated, 452, s. 8.
- Sorrow, 148, s. 8.
- Soul thinks not always, 63, s. 9, &c. not in sound sleep, 64, s. 11, &c. its immateriality, we know not, 380, &c. s. 6; 381, &c. religion, not concerned in the soul's immateriality, 395. our ignorance about it, 229, s. 27. the immortality of it, not proved by reason, 392, &c. it is brought to light by revelation, *ib.*

Sound, its modes, 143, s. 3.

Space, its idea got by sight and touch, 104, s. 2. its modification, 104, 105, s. 4. not body, 107, s. 11, 12. its parts inseparable, 108, s. 13. immoveable, *ib.* s. 14. whether body, or spirit, *ib.* s. 16. whether substance, or accident, 109, s. 17. infinite, 110, s. 21; 134, s. 4. ideas of space and body distinct, 112, s. 24, 25. considered as a solid, 129, s. 11. hard to conceive any real being, void of space, *ib.*

Species; why changing one simple idea of the complex one, is thought to change the species in modes but not in substances, 351, s. 19. of animals and vegetables, distinguished by figure, 320, s. 29. of other things, by colour, *ib.* made by the understanding, for communication, 304, s. 9. no species of mixed modes without a name, 305, s. 11. of substances, are determined by the nominal essence, 310—314, &c. s. 7, 8, 11, 13. not by substantial forms, 312, s. 10. nor by the real essence, 315, s. 18; 317, s. 25. of spirits, how distinguished, 312, s. 11. more species of creatures above than below us, 313, s. 12. of creatures very gradual, *ib.* what is necessary to the making of species, by real essences, 314, s. 14, &c. of animals and plants, not distinguished by propagation, 316, s. 23. of animals and vegetables, distinguished principally by the shape and figure; of other things, by the colour, 320, s. 29. of man, likewise in part, 318, s. 26. instance, Abbot of St. Martin, 318, s. 26. is but a partial conception of what is in the individuals, 322, s. 32. it is the complex idea which the name stands for, that makes the species, 323, s. 35. man makes the species, or sorts, 324, s. 36, 37. the foundation of it is in the similitude found in things, *ib.* every distinct, abstract idea, a different species, 324, s. 38.

Speech, its end, 279, s. 1, 2. proper speech, 283, s. 8. intelligible, *ib.*

Spirits, the existence of, not knowable, 462, s. 12. how it is proved, *ib.* operation of spirits on bodies, not conceivable, 407, s. 28. what knowledge they have of bodies, 364, s. 23. separate, how their knowledge may exceed ours, 95, s. 9. we have as clear a notion of the substance of spirit, as of body, 194, s. 5. a conjecture concerning one way of knowledge wherein spirits excel us, 198, s. 13. our ideas of spirit, 199, s. 14. as clear as that of body, *ib.* 201, s. 22. primary ideas belonging to spirits, 200, s. 18. move, 200, s. 19. ideas of spirit and body, compared, 201, s. 22; 205, s. 30. existence of, as easy to be admitted as that of bodies, 204, s. 28. we have no idea how spirits communicate their thoughts, 207, s. 36. how far we are ignorant of the being, species, and properties of spirits, 407, s. 27. the word spirit, does not necessarily denote immateriality, 381, &c. the scripture speaks of material spirits, *ib.*

Stupidity, 95, s. 8.

Substance, 189, s. 1. no idea of it, 55, s. 18. not very knowable, *ib.* our certainty,

concerning substances, reaches but a little way, 414, s. 11, 12; 416, s. 15. the confused idea of substance in general, makes always a part of the essence of the species of substances, 315, s. 21. in substances, we must rectify the signification of their names, by the things, more than by definitions, 365, s. 24. their ideas single, or collective, 103, s. 6. we have no distinct idea of substance, 109, s. 18, 19. we have no idea of pure substance, 190, s. 2. our ideas of the sorts of substances, 192—194, &c. s. 3, 4; 195, s. 6. observable, in our ideas of substances, 207, s. 37. collective ideas of substances, 208, &c. they are single ideas, *ib.* s. 2. three sorts of substances, 216, s. 2. the ideas of substances, have a double reference, 262, s. 6. the properties of substances, numerous, and not all to be known, 264, s. 9, 10. the perfectest ideas of substances, 195, s. 7. three sorts of ideas make our complex one of substances, 196, s. 9. substance, not discarded by the essay, 191, &c. the author's account of it clear as that of noted logicians, 191, &c. we talk like children about it, 190, s. 2; 193. the author makes not the being of it depend on the fancies of men, 189, &c. idea of it obscure, 380, &c. the author's principles consist with the certainty of its existence, 189, &c.

Subtlety, what, 346, s. 8.

Succession, an idea got chiefly from the train of our ideas, 80, s. 9; 115, s. 6. which train is the measure of it, 117, s. 12.

Summon bonum, wherein it consists, 172, s. 55.

Sun, the name of a species, though but one, 308, s. 1.

Syllogism, no help to reasoning, 485, s. 4. the use of syllogism, *ib.* inconveniences of syllogism, *ib.* of no use in probabilities, 491, s. 5. helps not to new discoveries, *ib.* s. 6. or the improvement of our knowledge, 492, s. 7. whether, in syllogism, the middle terms may not be better placed, 493, s. 8. may be about particulars, *ib.*

Taste and smells, their modes, 144, s. 5.

Testimony, how it lessens its force, 481, s. 10.

Thinking, 145. modes of thinking, *ib.* s. 1; 146, s. 2. men's ordinary way of thinking, 475, s. 4. an operation of the soul, 63, s. 10. without memory useless, 66, s. 15.

Time, what, 118, s. 17, 18. not the measure of motion, 120, s. 22. and place, distinguishable portions of infinite duration and expansion, 126, s. 5, 6. two-fold, *ib.* s. 6, 7. denominations from time are relatives, 214, s. 3.

Toleration, necessary in our state of knowledge, 478, s. 4.

Tradition, the older the less credible, 481, s. 10.

Trifling propositions, 443. discourses, 447, s. 9, 10, 11.

Truth, what, 418, s. 2; 420, s. 6. of thought, 418, s. 3; 421, s. 9. of words, 418, s. 3.

verbal and real, 421, s. 8, 9. moral, 421, s. 11. metaphysical, 267, s. 2. general, seldom apprehended, but in words, 422, s. 2. in what it consists, 423, s. 5. love of it necessary, 504, s. 1. how we may know we love it, *ib.* s. 1.

Vacuum possible, 110, s. 22. motion proves a vacuum, 111, s. 23. we have an idea of it, 75, s. 3; 76, s. 5.

Variety in men's pursuits, accounted for, 171, s. 54, &c.

Virtue, what, in reality, 41, s. 18. what in its common application, 37, s. 10, 11. is preferable, under a bare possibility of a future state, 180. how taken, 41, s. 17, 18.

Vice lies in wrong measures of good, 517, s. 16.

Understanding, what, 152, s. 5, 6. like a dark room, 101, s. 17. when rightly used, 14, s. 5. three sorts of perception in, 152, s. 5. wholly passive in the reception of simple ideas, 70, s. 25.

Uneasiness alone determines the will to a new action, 160, &c. s. 29, 31, 33, &c. why it determines the will, 163, s. 36, 37. causes of it, 173, s. 57, &c.

Unity, an idea, both of sensation and reflection, 80, s. 7. suggested by every thing, 150, s. 1.

Universality, is only in signs, 287, s. 11.

Universals, how made, 99, s. 9.

Volition, what, 152, s. 5; 155, s. 15; 159, s. 28. better known by reflection, than words, 160, s. 30.

Voluntary, what, 152, s. 5; 153, s. 11; 159, s. 27.

What is, is, is not universally assented to, 21, s. 4.

Where and when, 127, s. 8.

Whole, bigger than its parts, its use, 435, s. 11. and part not innate ideas, 47, s. 6.

Will, what, 152, s. 5, 6; 155, s. 16; 159, s. 28. what determines the will, *ib.* s. 29. often confounded with desire, 160, s. 30. is conversant only about our own actions, *ib.* s. 30. terminates in them, 165, s. 40. is determined by the greatest, present, removable uneasiness, *ib.*

Wit and judgment, wherein different, 97, s. 2.

Words, an ill use of, one great hinderance of knowledge, 409, s. 30. abuse of words, 344, sects introduce words without signification, *ib.* s. 2. the schools have coined multitudes of insignificant words, *ib.* s. 2. and rendered others obscure, 346, s. 6. often used

without signification, 344, s. 3. and why, 345, s. 5. inconstancy in their use, an abuse of words, 345, s. 5. obscurity, an abuse of words, 346, s. 6. taking them for things, an abuse of words, 348, 349, s. 14, 15. who most liable to this abuse of words, *ib.* this abuse of words is a cause of obstinacy in error, 350, s. 16. making them stand for real essences we know not, is an abuse of words, 350, 351, s. 17, 18. the supposition of their certain evident signification, an abuse of words, 352, s. 22. use of words is, 1. To communicate ideas; 2. With quickness; 3. To convey knowledge, 354, s. 23, 24. how they fail in all these, 354, s. 26, &c. how in substances, 355, s. 32. how in modes and relations, *ib.* s. 33. misuse of words, a great cause of error, 357, s. 4. of obstinacy, *ib.* s. 5. and of wrangling, 358, s. 6. signify one thing in inquiries; and another in disputes, *ib.* s. 7. the meaning of words is made known, in simple ideas, by shewing, 361, s. 14. in mixed modes, by defining, *ib.* s. 15. in substances, by shewing and defining too, 363, s. 19; 364, s. 21, 22. the ill consequence of learning words first, and their meaning afterward, 365, s. 24. no shame to ask men the meaning of their words, where they are doubtful, 365, s. 25. are to be used constantly in the same sense, 367, s. 26. or else to be explained, where the context determines it not, *ib.* s. 27. how made general, 279, s. 3. signifying insensible things, derived from names of sensible ideas, 280, s. 5. have no natural signification, 281, s. 1. but by imposition, 283, s. 8. stand immediately for the ideas of the speaker, 281, 282, s. 1—3. yet with a double reference:—1. To the ideas in the hearer's mind, 282, s. 4. 2. To the reality of things, *ib.* s. 5. apt, by custom, to excite ideas, 283, s. 6. often used without signification, *ib.* s. 7. most general, 284, s. 1. why some words of one language cannot be translated into those of another, 303, s. 8. why I have been so large on words, 307, s. 16. new words, or in new significations, are cautiously to be used, 330, s. 51. civil use of words, 334, s. 3. philosophical use of words, *ib.* these very different, 339, s. 15. miss their end when they excite not, in the hearer, the same idea as in the mind of the speaker, 334, s. 4. what words most doubtful, and why, *ib.* s. 5. what unintelligible, *ib.* fitted to the use of common life, 334, s. 2. not translatable, 303, s. 8.

Worship not an innate idea, 48, s. 7.

Wrangle, about words, 448, s. 13.

Writings, ancient, why hardly to be precisely understood, 343, s. 22.

THE END.
